Chinese government had restricted the private association and private sector self-regulation in fear of the threats posed by uncontrolled social movement and alliance. At the same time, complex social problems, such as poverty, labor conflicts, domestic violence, education and health care for disadvantaged groups, etc., are increasingly beyond the capacity of the government to deal with on its own (Teets 2013). Since 2013, the CCP for the first time replaced the "social management" approach with the "social governance" approach to solve social problems. "Social governance" refers to a mode of governance in which the Party state provides the leadership; non-governmental partners and individual residents are encouraged to participate. Local governments are encouraged to contract out social services to social organizations (Ministry of Finance and Ministry of Civil Affairs 2016).

By 2014, China has over 600,000 registered social organizations, employing over 6,800,000 people. Since 2012, Chinese central government allocates grants for local social organizations to apply for. In 2016, the total grants amount to 200 million CNY. Local governments also allocate grants from its budgetary and non-budgetary revenue to purchase social organizations' service programs (Lin 2016). Although social organizations are still persuaded to establish Party cells, major government control over them is more of a managerial type. Through program evaluation, organizational evaluation, and auditing, the government hold social organizations accountable (Jing and Savas 2009).

## Recent Public Sector Reforms in Hong Kong

### Civil Service Reforms

Hong Kong's civil service system is similar to many Westminster governments. Most civil servants are selected through exams at the junior ranks. The promotion is based on performance and seniority. Most civil servants are employed on permanent terms. Compared to their counterparts in mainland China, civil servants in Hong Kong are very well paid (Cheung 2013). Their salaries are annually adjusted according to economic situation such as inflation. When financial crisis hit Hong Kong in 1997, there were 190,000

civil servants. To reduce public expenditure, the government downsized the civil service to 159,400 in 2007. More staff were employed on non-civil service contract terms (Scott 2010). Since 2007, with economic recovery and increasing demand for public services, civil service establishment had grown steadily to 175,889 in 2016 (Civil Service Bureau 2016a). This size is still smaller than in 1997. Many public services and projects are now outsourced to private providers to deliver. In 2015, due to the aging of civil servants, the retirement age for new recruits was extended from 60 to 65 for civilian civil servants and from 55 to 60 for disciplinary civil servants (Civil Service Bureau 2016b).

### Performance Management

Hong Kong civil service adopted performance management reforms in 1999. The major goal of the reform is to translate departmental strategies and objectives into practical and realistic performance goals down to individual staff. One major measure is the adoption of the performance appraisal to record, review, and monitor civil servants' performance; to identify their training and development needs; to facilitate the selection of officers for posting, promotion, and succession planning; and to provide a reference for rewarding civil servants. The major problems in implementing the reforms include generous performance rating, perceived inconsistency of appraising criteria, lack of due process and transparency in performance appraising, delayed performance management cycle and delayed feedback to appraisees, etc. Since civil servants' pay is still largely determined by their rank and the performance rating is only one of the factors for considerations by promotion boards, performance management reforms have moderate impact on changing civil servants' behavior in Hong Kong (Burns 2004). The Public Service Commission (PSC) regularly monitors the implementation of performance management system. The civil service bureau issued a performance management guideline in 2009 and updated the guideline in 2013 to address the issues raised by the PSC (Government Secretariat 2013).

### Political Accountability Reforms

Many Hong Kong citizens have demanded to elect Legislative Councilors and Chief Executive (the mayor) directly since the 1980s. However, due to the gaps between the central government's preferences and some local citizens, Hong Kong's mayor is currently still elected by a relatively small electoral college. He or she is not allowed to affiliate with political parties, and only half of lawmakers are directly elected by ordinary citizens. The widening wealth gaps and unpopular policies in Hong Kong during the two decades after returning to Hong Kong have resulted in more societal and political conflicts (Lo 2015). Facing enormous governance challenges, the government replaced the civil servants with political appointees to be policy secretaries in 2002 and introduced two layers of political advisors in 2008. The reform was intended to improve the political accountability of the government. After the reforms, political appointees have taken over from senior civil servants the role of assisting the Chief Executive to implement the policy agenda and steer the political process of policymaking. Senior civil servants continue to play a hybrid political-administrative role in providing advice for formulating policy options, monitoring policy implementation, and facilitating negotiations with stakeholders (Burns et al. 2013). However, the lack of coalition-building mechanism among political executives, legislators, and societal interests has constrained the government's ability to form societal consensus (Ma 2007). In addition, despite that the political accountability reform has enabled political executives exerted more control over the civil service, continuity of civil service values has limited the political executives' responsiveness to policy problems (Burns and Li 2015).

### Administrative Structural Reform

After the establishment of the Hong Kong Special Administrative Region, the government structure was reorganized in 1999, 2000, 2002, 2007, and 2015. The structural separation of policy bureaus and departments enables the government secretariat to reallocate the policy responsibilities among

departments relatively frequently. The major purpose of the reorganizations is to ensure that the Chief Executive can implement policy agenda effectively. For example, in 1999, the Broadcasting, Culture and Sport Bureau was restructured to be the Information, Technology and Broadcasting Bureau, taking over the development of information technology applications and telecommunications from other bureaus. However, the 2007 government organization put the portfolio under the Commerce and Economic Development Bureau. Only in 2015, the government established the Innovation and Technology Bureau, taking over the department of Innovation and Technology Commission and the Office of the Government Chief Information Officer. Three reorganizations took place under the administrations led by three different Chief Executives, reflecting the varied degree of importance they attached to the innovation and technology policy (Legislative Council Secretariat 2012; Government Press Release 2015).

### Collaborative Governance

To maintain a low tax rate, attract overseas investors, and sustain its public finance, Hong Kong civil servants and economic elites have been rather conservative in social welfare expenditure and long-term policy commitment in education, health care, housing, retirement protection, poverty reduction, etc. In some service sectors such as residential care for the elderly, preprimary education, etc., private profit- and nonprofit-making organizations are the major service providers. In recent years, the government is pressured to provide more services to handle the challenges of population aging and declining labor force. The government leverages private service providers' capacity by subsidizing their services (Lee 2005). For example, facing rising costs and demands for residential care, the government purchases community-based elderly care services from nonprofit service agencies by distributing vouchers to the elderly citizens since 2013 (Kwok et al. 2014). The level of subsidies varies according to the elderly's income. The government used similar approaches to subsidize the preprimary education from 2007 to 2016. Parents were encouraged to choose kindergartens, while kindergartens were allowed to recruit students according to their own policy (Wong and Rao 2015).

Involving citizens as co-implementer, codesigner, and co-initiators in program development and delivery is another case of collaborative governance to solve public problems. This approach seeks to incorporate nonmaterialistic and noneconomic interests and values into urban development. One example is the establishment of Harbor-front Enhancement Committee which involves nongovernmental actors in developing the harbor-front and seek to balance the economic development and environmental protection for public interests (Cheung 2011). Government's role is to provide financial and nonfinancial (such as good reputation) rewards to facilitate and motivate private actors to jointly deliver public goods and services.

In collaborative projects that involve mainly profit-making agencies as deliverers, the public demands more regulations and even reversal to government control due to problems of inflated costs, delay, low quality, conflictual labor relations, and even corruption (Haque 2005). In a recent case, drinking water in some public housing estates was found to be related to 163 children and pregnant women's high level of lead in blood. The government investigations concluded that the implementing departments should have established an effective regulatory system to monitor the building contractors' compliance with legal and contractual requirements to ensure high water quality (Commission of Inquiry into Excess Lead Found in Drinking Water 2016).

## Conclusion

Public sector reforms in mainland China and Hong Kong share more similarities in recent years. First, they both emphasize values of efficiency and encourage public-private partnership. Second, they both have to address social problems arising from widening wealth gap and aging population. Third, they are both integrated in the world economic system and face competition from other cities in the region.

However, despite the similar reform ideas, the reform impact in various areas differs due to structural and normative legacies in mainland China and Hong Kong. For example, collaborative governance in China had not encouraged the growth and regulation of private NGOs until very recently. By contrast, collaborative governance in Hong Kong was more quickly embraced by the government due to the importance of resourceful, competent, and vocal societal actors in policy processes (Lam and Perry 2000). The gaps between the intended reform goals and the actual reform impact are also wider in mainland China due to the concentration of Party's power within the public sector. Many of China institutional reforms seek to solve social and economic problems by proactively reducing poverty, serving the elderly population, and investing in technology. On this aspect, Hong Kong public sector reforms seem to converge with China, and its "laissez-faire" governing approach is being replaced by a more proactive attitude towards social and economic developments (Cheung 2013).

## Synonyms

Central-local government relations; Decentralization; Intergovernmental relations; Public personnel administration; Public sector human resources management; Subsidiarity

## Definitions

***Decentralization*** is the transfer of responsibility and authority for planning, management, resources mobilization and allocation from the central government and its agencies to

field or sub-national units of government (Rondinelli 1981).

***Recruitment*** is the process of generating a pool of qualified candidates for a particular job, whilst ***Selection*** on the other hand is the process of making a 'hire' or 'no hire' decision with respect to each applicant for a job (Armstrong 2009; Gomez-Mejia et al. 2012). This involves a determination of the required characteristics for effective job performance, based on job analysis.

## Introduction

Decentralization is considered a paradigm shift in centralized government style and has become a major feature of governance reforms. Decentralization and local governance have been adopted by countries the world over to enhance service delivery and autonomy to people. The literature on decentralization is replete with a number of studies, which argue on the theoretical benefits including inter alia, improved quality of service delivery, public accountability, and effective maintenance of law and order (Naidoo 2005). The off-loading of central government of so many burdens, development of local political and administrative competence, renewed methods for community participation, strengthened autonomy, and decision-making power of many views are benefits produced by decentralization (Rondinelli 1981; Ahwoi 2010). Others claim it is a means of enhancing local government capacity by delivering public sector modernization, promoting citizen participation in the development process and bringing the policy-making process closer to citizens (Grindle 2007).

While some empirical literature confirms the proposed benefits, diverse studies are poles apart in their respective conclusions (Olowu 2003; Yeboah-Assiamah 2014). For example, while Olowu (2003) argue that government becomes more responsive through decentralization, Yeboah-Assiamah (2014) thinks otherwise. Hence, a deficit between the benefits proposed in theory and that experienced in practice. It is, therefore, relevant to embark on specific contextual studies to assess the nexus between the theoretical assumptions underpinning decentralization and practical experiences.

In Ghana, decentralization and local governance was properly established in 1988 and has been strengthened by various legislations, ostensibly towards enhancing its effectiveness and autonomy. This was made possible through the transfer of authority, power and functions, competence, and other forms of resources to the sub-national levels such that service delivery and decisions will be made closer to, if not exactly at the point of delivery. Although mixed in nature, the framers of Ghana's 1992 Republican Constitution inserted clauses that sought to make local governments more assertive. For instance, the Constitution directs Parliament to pass relevant legislations to facilitate power transfer as well as the transfer of responsibilities and other resources from the center to local government entities in a coordinated means (Article 240 (2a)). The local government system was envisaged to be given the necessary capacity and autonomy to initiate plans and coordinate and execute policies on matters bothering the people within their territorial boundaries towards the ultimate localization of those activities (Article 240 (2b)).

After close to 15 years of decentralization practice [since 1988], the Local Government Service Act 2003 (Act 656) paradoxically was charged to mark the beginning of a functioning decentralized departments at the Metropolitan, Municipal and District Assemblies (MMDAs) level, with the "...transfer of functions to the relevant decentralized departments, transfer of staff from the Civil Service to the Local Government Service, and establish a performance-based management system for both human resource and service delivery." This Act has therefore transferred the human resource management (HRM) responsibility including the recruitment of local government personnel from the Civil Services Commission to the Local Government Service Secretariat (LGSS). One could argue that Act 656 theoretically sets a tone for decentralized human resource management system in Ghana's local governance structure. The so-called commencement of proper human resource decentralization could not provide any appreciable improvement in personnel issues even

after a decade and the signs appeared glaring which greeted the then Head of the Local Government Service (Dr. Callistus Mahama), who assured to establish human resource (HR) units in all the Assemblies to facilitate recruitment and selection of their needed manpower.

Recruitment and selection of the desired human resource [the most valued asset, see Mathis and Jackson, 2011] is regarded as a crucial process [bedrock] towards the ultimate realization of organizational mandate and action plans. Consequently, there have been strenuous efforts to constantly improve this all-important HR function across sectors. Surprisingly, these efforts seem to be inadequate in local government discourse as HR practice at the local governments has not been given adequate empirical scholarship in the literature resulting in the paucity of empirical literature on the impact of decentralization on local government staffing issues [recruitment and selection]. The main object of this chapter is to examine the impact of decentralization on human resource management, with a special focus on recruitment and selection of personnel to the local government of Ghana. The study is underpinned by the following key research questions: (i) how has decentralization institutional reforms impacted recruitment and selection to MMDAs? (ii) how do the MMDAs feature in the recruitment and selection process? (iii) what has been the interplay of roles between the local and central government bodies in the recruitment process? and (iv) how has decentralization institutional reforms impacted human resource practices at the local level? The rest of the chapter is organized into four main sections: a discussion of relevant literature and theoretical overview of decentralization, autonomy, and recruitment processes; the methods and approaches employed in carrying out this study; a discussion of the study findings; and finally, useful conclusions and relevant policy suggestions.

## Conceptual Overview

### The Concept of Decentralization

Although the term decentralization defies a harmonized definition, it has rich conceptual and empirical connotations, which signifies static and dynamic processes. It also refers to pure ideal type, which moderates incremental change in a governmental system. The concept can be defined both in functional and territorial terms.

Territorial decentralization is defined by Rondinelli (1981:137) as "the transfer of responsibility for planning, management and the raising of and allocation of resources from the central government and its agencies to field units of central government ministries or agencies, subordinate units or levels of government, semi-autonomous public authorities or corporations, area-wide, regional or functional authorities or non-governmental private or voluntary organization." Based on this definition, decentralization is about the transfer of authority on a geographical basis whether by deconcentration of administrative authority to field units of the same department or level of government or by the political devolution of authority to the local government units or special statutory bodies. Functionally, decentralization is the transfer of authority from central to peripheral organizations of the same level, for example, from a government department to a parastatal agency. In sum, the concept involves the transfer of power, resources, and responsibilities to subnational units of government.

### Forms of Decentralization

Three major forms of decentralization have been established in the literature: devolution, deconcentration, and delegation. However, other literatures consider privatization as well. Firstly, deconcentration is a situation where financial management responsibilities and decision-making authority are redistributed among other levels of central government. Rondinelli (1981) argues that deconcentration takes place as long as the central government disperses certain responsibilities of services to the regional and local governments. On the other hand, delegation is a more extensive form of decentralization that involves a transfer of decision-making responsibility and administration of public functions from central government to semi-autonomous organizations, which are not fully controlled, but ultimately accountable to central government. Ayee (2000) explained further that services and responsibilities

are mostly transferred to specialized organizations with some degree of operating autonomy. With devolution, central government transfers responsibilities for services to municipalities that elect their own mayors and councils and raise their own revenues, with independent authority to make investment decisions (Nsarkoh 1964). Hence, it is normally referred to as political or true decentralization, while deconcentration is also referred as administrative or fiscal decentralization.

## Human Resource Management and Decentralization

Local governments worldwide, including that of Ghana, has faced numerous challenges since its inception. Notably among these are inadequate funding (Sakyi 2008), political interference, and limited skilled human resource (Wood 2000). From this background, past and present leaders have made substantial effort in building local level human resource capacity. In this light, Dr. Callistus Mahama, former Head of the Local Government Service, declared after a familiarization tour of some Assemblies in Ghana that the body is determined to establish HR units in all the Assemblies in order to improve their manpower base. The HR units, according to him, would among other things be mandated to promote the capacity building of local government staff, facilitate recruitment and selection of the needed manpower for the assemblies, and commit itself to the improvement of the general welfare of staff.

Human resources management in local government institution often involves a set of highly structured and complex procedures in most developing economies, of which Ghana is no exception. The link between decentralization and human resource management can be found in the numerous HR management systems usually applied in local government. These includes separated, integrated, and unified models (Olowu 2003). The *integrated model* often involves the deployment of central government staff to local governments. Regarding the *separated model*, local governments have autonomy to hire and fire their own staff, as opposed to the *unified model* which is characterized by common civil service across local governments with state control only at the appointment stage. Olowu (2003) posits that the unified model is gaining popularity as it allows local governments to take the responsibility of managing their own human resources with minimum dependence on central government. Both unified and integrated systems are found in situations where there is no trust from the center for local governments to hire strategically but as patronage.

## Recruitment and Selection

The process for engaging the services of employees by public organization is considered as staff appointment. Several activities are involved. Significant among them is recruitment and selection. Eddy (1981: 56) contends that "without the meanings that are provided by the human mind, organizations are only piles of stone and metal and blobs of ink on pieces of papers." Employees are therefore the most valuable asset of every organization.

Gomez-Mejia et al. (2012) define recruitment as the process of generating a pool of qualified candidates for a particular job. In recruitment, it is significant to have a large pool of the right people with the right skills at the right place and time. Selection, on the other hand, is making a "hire" or "no hire" decision with respect to each applicant for a job (Armstrong 2009; Gomez-Mejia et al. 2012). The process involves determining the required characteristics for effective job performance, based on a job analysis and then measuring them against that of applicants (see Fig. 1).

According to Le and Kleiner (2000), negligent hiring is a legal risk, which can cause an organization to fail. Negligent hiring occurs when an organization fails to do adequate background investigation about candidates' competence. The former Chairman and CEO of Citicorp Walter Wriston argues, "I believe the only game in town is the personnel game. My theory is that, if you have the right person in the right place, you don't have to do anything else. If you have the wrong person in the job, there's not a management system known to man that can save you." Therefore, it is important that the right people are selected, trained, and rewarded so that they perform their jobs properly or handle other functions within their areas of responsibility. Public sector recruitment could be from either internal or external

**Recruitment and Selection into Ghana's Local Governments: Theory and Practice, Fig. 1** Recruitment and selection processes

sources; the latter includes referrals from either current or former employees or customers, radio, print, internet advertisement, career websites, and social media. On the other hand, internal recruitment involves promoting or recruiting qualified personnel from within the organization to occupy vacant position. While the internal source offers people with organizational knowledge, the external source promotes innovation and creativity in the organization (ibid).

## Autonomy of Local Government

In decentralization, human resource functions in areas of recruitment and selection should be done autonomously to ensure effective service delivery. However, a few countries have given to their decentralized units a high degree of autonomy to perform these functions. Clark (1984) conceptualizes autonomy, which draws on the immunity and initiative principles of power derived by Jeremy Bentham. According to Clark, immunity signifies the power of local authorities to freely act without supervision from central government or its agencies while initiative is the power of local authorities to make laws and regulate the behavior of its residents (Clark 1984). In his attempt to distinguish between initiative and immunity to enable him compare different local authorities, he developed these principles further into fourfold typologies [type 1: initiative and immunity; type 2: initiative and no immunity; type 3: no initiative and immunity; and type 4: no initiative and no immunity]. The form of autonomy a local authority will have is conditioned on existing constitutional and financial controls. For instance, Sakyi (2008) observed that transfer of decision-making and planning authority was rarely operational at local level with control over personnel and financial decisions remaining centralized.

Similarly, Naidoo (2005) and Ishii et al. (2013) both realized that central governments withheld some degree of power thereby limiting the extent of decentralization. Particularly, Ishii et al. (2013) found in Thailand and Philippines that even though responsibility for HRM of local government personnel had been devolved to the local chief executives, the local government still resort to the procedures laid down by the central government regarding recruitment and selection.

## Sequential Theory of Decentralization (STD)

Although earlier scholars of decentralization claim that the policy always increases the autonomy of local authorities irrespective of their outcomes, Falleti (2005) disagrees by arguing that the magnitude of such autonomy may be either substantial, insignificant, or decreased depending on a sequence of decentralization reforms: fiscal (F), administrative (A), and political (P). His attempt to explain this variance in power transfer, he proposed the Sequential Theory of Decentralization with three core characteristics: territorial interests of bargaining actors, decentralization as a process, and policy feedback effects in bargaining (Falleti 2005).

The theory posits that the initial type of decentralization that is pursued is dictated by territorial interests. This first move could be either by the

subnational government (Governors/Mayors) or by the central government (Presidents). The initial type then triggers some policy feedback effects, which leads to further reforms. For instance, Falleti (2005) illustrates that when the policy is initially moved by the central government, administrative decentralization is often the first and later results in a policy feedback effect known as power reproduction mechanism. This effect is due to limited financial resources accompanying such transferred responsibilities. At this stage, central government dictates the terms of financial autonomy transferred to subnational units known as the fiscal decentralization. This limited autonomy to resources is followed by demands for political decentralization.

On the other hand, however, if the subnational initially moves for decentralization, political decentralization is most likely to occur first, which then leads to a policy ratchet effect. This effect refers to continued demands for further decentralization by a group of supporters. Political decentralization equips the capacities of actors at the subnational level to struggle for a share in the greater political autonomy enjoyed by central government. Fiscal decentralization is subsequently demanded, with terms influenced by local actors. Administrative decentralization follows as the last type of reform. Table 1 illustrates these processes. From Table 1, while the former sequence of reforms (A → F → P) follows the interests of the national executives and may yield little or no change in power redistribution to the subnational actors, the latter sequence (P → F → A) most likely may lead to a greater degree of autonomy for sub-national units of government. STD recognizes a complete cycle of decentralization reform when political, fiscal, and administrative decentralization have taken place.

## Method and Data Collection

Using Ga-West Municipal Assembly (GWMA) of Ghana as a case, a qualitative approach was adopted to explore answers to the aforementioned research questions. The Assembly forms part of 16 Metropolis, Municipalities, and Districts Assemblies in the Greater Accra Region and one of 216 local government administrations in Ghana. Both primary and secondary data were used. The secondary data involved policy documents, reports, and bulletins from the Local Government Service of Ghana relevant to recruitment and selection, as well as journal articles from credible databases including Sage, Emeraldinsight, and ScienceDirect. Data obtained from these sources were scrutinized for suitability and relevance by firstly scanning through their abstracts followed by a thorough analysis of the selected articles.

On the other hand, primary data were mainly audio recordings from in-depth face-to-face interviews with seven personnel of management capacities who were purposively sampled: Assistant Director, Human Resource Manager, Internal Auditor, and Budget Officer, all from GWMA; the Human Resource Manager and the Director of Research, Statistics and Management Information Systems from Local Government Service Secretariat (LGSS); and the Dean of Institute of Local

**Recruitment and Selection into Ghana's Local Governments: Theory and Practice, Table 1** Two sequences of decentralization and effects on the intergovernmental balance of power (Adapted from Falleti 2005)

| Prevailing interest in first move | 1st type of decentralization reform | Feedback mechanisms | 2nd type of decentralization reform | 3rd type of decentralization reform | Degree of change in inter-governmental balance of power |
|---|---|---|---|---|---|
| Central Government | → **Administrative** | Self-reinforcing *(policy reproduction)*→ | **Fiscal** → | **Political** | **Low** |
| Subnational | → **Political** | Self-reinforcing *(policy ratchet)* *9* | **Fiscal** → | **Administrative** | **High** |

Government Studies (ILGS) all in the Greater Accra Region of Ghana.

The interviews were transcribed from audio to word format and sorted out in themes. The similarities and variations in the responses were reconciled against each other to ascertain emerging themes and patterns, which have been used in the analysis. These themes have been discussed adequately, and in most cases, narratives from respondents are used to support the discussion and arguments.

## Results and Discussion

### Legal Basis for Decentralization in Ghana

Taking into account the significant role of decentralization in national development, framers of Ghana's 1992 Constitution provided for it, a legal justification in Chapter 20. Article 240 (1) provides that "Ghana shall have a system of local government and administration which shall, as far as practicable, be decentralized." The local government of Ghana according to this article shall be provided with all requisite attention towards attaining the highest level of decentralization. Clause 2 (a) of article 240 adds that Parliament shall through the enactment of appropriate laws ensure that "...functions, power, responsibilities and resources are ... transferred from the central government to local government units in a coordinated manner." These laws, according to clause 2 (b), are needed to "... enhance the capacity of local government authorities to plan, initiate, co-ordinate, manage and execute policies in respect of all matters affecting the people within their areas." Currently, the District Assembly comprises a person from each electoral area of the district elected by universal adult suffrage, Member(s) of Parliament (MP(s)) whose constituency falls within the area, Municipal/District Chief Executive (M/DCE) who is the political head of the District, and not more than 30% of members appointed by the President, with the endorsement of majority (not less than two-thirds) of members of the Assembly in a vote in the case of M/DCEs, and in consultation with the traditional authorities and other relevant interest groups in the district in the case of other 30% members (article 242 and 243).

Aside the 1992 Constitution of Ghana, Local Government Act, 1993 (Act 462) [(repealed by Local Government Act, 2016 (Act 936)]; District Assembly Common Fund Act, 1993 (Act 455); Local Government Service (LGS) Act, 2003 (Act 656); The National Development Planning Systems Act, 1994 (Act 480) are some other appropriate laws enacted by Parliament in fulfilment of Article 240 (2). For instance, while Local Government Act, 1993 (Act 462) and District Assembly Common Fund Act, 1993 (Act 455), respectively provide for the structures and administration of central government financial transfers to local government units, the Local Government Service Act, 2003 (Act 656) seeks "to secure effective administration and management of local government in the country." This Act has therefore transferred the human resource management responsibility including the recruitment of local government staff from the Civil Services Commission to Local Government Service Secretariat (LGSS).

Regarding recruitment of staff into Ghana's local government, article 35 (5) and (6b) of the 1992 Constitution of Ghana prescribes that the state shall promote national integration and diversity through reasonable regional and gender balance and prohibit any form of discrimination and prejudice in recruitment and appointment into all public offices. Therefore, the Public Services Commission in article 196 of the same Constitution is mandated to exercise supervisory, regulatory, and consultative functions in accordance with law, including entrance and promotion examinations, recruitment, and appointment into or promotions within the public services. These procedures are explicitly outlined in the Local Government Service Human Resource Operational Manual (LGSS 2013). Part 1, section 2.6.1 of the LGS-Human Resource Operational Manual (2013) clearly provides that "appointing authority, in filling any vacancy within the Service, must first take into consideration the following: the organizational Human Resource Plan, the existence of vacancy, the approved scheme of service, existing establishment schedule vs. actual staff

strength, exit of the existing employees/replacement, new positions on account of service expansion, identified talent gaps, job descriptions for positions, manpower/financial clearance by Head of Service/Ministry of Finance and Economic Planning as well as consultation with the Public Services Commission and Sector Ministries as appropriate" (LGS 2013:11).

## Recruitment and Selection Process in Ghana's Local Government

### Determination of HR Needs

The first objective was to assess the recruitment and selection process in Ghana's local government. Staff needs are foremost determined. The LGSS and District Assemblies do this together. The HR Department of LGSS annually sends a circular to all unit heads of MMDAs requiring their needed staff strength and the gap thereof, the knowledge, skill, and qualification required to effectively perform assigned duties. This information is later collated into a comprehensive HR Plan. For instance, a top management official of GWMA explained that:

> Needs assessment forms from the HR department are distributed to all units within the municipal assembly… a capacity building plan is developed out of the information presented by the assessment forms

An HR officer of an Assembly confirmed this.

> Staff needs are determined by Heads of the various units through the information they provide on their need assessment form to the HR department

Meanwhile, at the Local Government Service Secretariat (LGSS), the HR unit undertakes staff situation analysis by considering the capacity building or HR plans of all Assemblies to identify HR gaps based on which professionals are recruited. For instance, this gap according to the 2012 LGS Annual Progress Report stood at 15,000, which was used for a 5-year recruitment plan.

### Two Categories of Staff in Local Governments

It was observed that the recruitment process depends on whether the prospective staff is a "mechanized" or local staff. The criterion for classification is discussed below.

**Mechanized Staff:** These staff are recruited and posted by LGSS and paid from the national coffers. To be recruited into the Assemblies as a mechanized staff, one must have to apply through the LGSS upon filling the "A2 form" and attaching the necessary documents. These staff mostly comprise personnel occupying top and middle level management positions such as the Coordinating Director who is responsible for General Administration; heads of the various departments and technicians: Engineers, Auditors, and Planners among others. For instance, an HR officer at LGSS unequivocally stated

> We comb through our numerous applications received previously to select the best suitable for the job considering their specifications and background. We receive a lot of unsolicited applications

It was revealed that the process at LGSS has been same since after the general recruitment in 2012. Respondents from the Assembly and ILGS opined that recruitment into local government was formerly the responsibility of the Civil Services Commission (CSC) before the passing of Local Government Service Act 2003 (Act 656) which transferred the function to Local Government Service Secretariat (LGSS).

**Local Staff:** The local staff on the other hand are recruited by the MMDAs and paid from the Internally Generated Funds (IGF). This group of staff comprises drivers, cleaners, revenue collectors, and messengers amongst the likes. HR officers upon receiving authorization from the LGSS proceed to recruit by screening unsolicited applications received from which local candidates who meet the basic requirements are invited for job interviews.

> We only recruit local staff for the Assembly. Due to the fact that we receive lots of applications, we shortlist applicants when there is the need to replace a staff

It was also discovered that major political actors in the Assembly such as the M/DCEs, Regional Ministers, MPs, and Presiding Members

often patronize authorities responsible for staff selection during this process. Views from all the respondents confirmed this finding.

> The MCE, Regional Minister and other politicians take advantage of . . . the process and recommend their cronies for the job in exchange for political support

This finding corroborates an observation elsewhere in Uganda where decentralization of recruitment and selection roles to local bodies resulted in negative externalities or unintended consequences, where other non meritocratic considerations largely became the key determining factor of ones success in securing a local government job (Galiwango 2008).

### General Selection Activities and Processes

Theoretically, bothering on general selection processes of staff into MMDAs, short listing/screening, competitive entry examination, interviews, medical examination, final appointment, acceptance, and job placement were undertaken. Both HR Managers from the Municipal Assembly and LGSS were of similar view. From the ILGS and LGSS, however, it was identified that the last general recruitment in 2012 which witnessed the selection and posting of 2601 qualified persons to the various MMDAs across the nation to help boost local government human resource capacity experienced both "group to panel" and "individual to panel" interviews.

### Staff Progression

Personnel being promoted and recommended for replacement were not examined. The principal officer explained the underpinning rationale.

> they are not examined because of their previous experience and organizational knowledge

Although some studies have recommended several types of assessment tools such as personality test [to assess the personality trait] and ability test [to assess cognitive ability of prospective candidates to perform in their (new) job] (Gomez-Mejia et al. 2012), their absence does not invalidate a particular recruitment process depending on the context. For instance, candidates for promotion including both mechanized and local staff (to be recommended for replacement) are considered to have previous knowledge of the organization and its operations as well as their competencies already known through performance appraisals. Concerning career progression, the HR unit of the Assemblies only scrutinizes these candidates at a formally organized interview prior to their recommendation. The finding is in accordance with part 1, section 2.6.1 of the LGS-HR Operational Manual (LGS 2013, 11).

### No Recruitment But Selection?

Notwithstanding, no advertisement is done with respect to vacant positions due to a current embargo on public employment. The ban, referred to by some politicians as "net freeze," is a public sector recruitment reform, since 2010. It was meant to control the increasing wage bill on government, although appointments are made at the various local governments. The LGSS and GWMA only screen the unsolicited application received for replacement when there is a vacant position.

The absence of examination and advertisement may be grounds for political influences (Ishii et al. 2013) and negligent hiring (Le and Kleiner 2000) as the authorities may fail to thoroughly assess the competency of applicants. In addition, the process is deprived of the benefits associated with selecting from a large pool (Gomez-Mejia et al. 2012); diversity, innovation, and high quality personnel among others even if selection is claimed to be made on merit.

Evidence from the field suggests that from the last general recruitment in 2012 to June 2016, LGSS had authorized about 150 replacements, transfers, and postings of mechanized staff to GWMA, with the Assembly appointing only about 50 local staff with recourse to no proper recruitment procedures. This number does not represent the current staff strength of the Assembly because some of these personnel might have, perhaps, left or been transferred to other Assemblies or even been promoted as mechanized staff within this 4-year period.

## Responsibility for Local Government Recruitment and Selection

In an attempt to identify the authority responsible for appointment, respondents were asked questions such as: "who is in charge of the selection activities?" and "who authorizes the final appointment?" These were meant to find out which body; whether the Assembly or Secretariat is responsible for the appointment of staff at the MMDA. Also it sought to assess the level of autonomy transferred as decentralization requires.

### HRM and District Coordinating Units

The HRM unit at GWMA was found to be responsible for the appointment of local staff, while LGSS appoints and posts mechanized staff to the MMDAs. Also it was identified that the MMDAs have the authority to recommend local staff with same qualification, knowledge, skill, and experiences for replacement with old mechanized staff who are deceased, resigned, retired, or whose appointment are terminated. A principal officer who was at the time of the interview processing a replacement of a mechanized deceased staff with a local staff informed:

> the LGSS shortlists, appoints and post mechanized staff to us here. However, we may recommend a local staff to the LGSS for replacement into the mechanize system.

### Local Government Service

The Head of Local Government Service (LGS) who is also the Secretary to the Local Government Service Council signs the appointment letters of mechanized staff and also approves the recommendation of local staff to be replaced with old mechanized staff, while the Coordinating Director (CD), who is the administrative head of GWMA or the HRM on the CDs behalf, signs that of the local staff. This was explained by a key respondent at the GWMA:

> . . .our HR unit is in charge of all the selection activities of local staff

In sum, the LGSS upon receiving a notice of vacant position (either mechanized or local staff) from the Assemblies may choose to appoint and post or transfer personnel to the Assembly or request the Assembly to recommend competent persons either a local staff or promotion of a mechanized staff for their approval for replacement purposes (in the case of mechanized staff). In the case of local staff, the Assembly merely informs LGSS with details of the replacement made.

### A Unified Model?

This finding suggests that the model system practiced currently is the unified models where both the central agency and local government unit participate in the recruitment and selection process. For instance, the HR manager of GWMA [local government] conducts interviews to process replacements of mechanized deceased staff with local staff for subsequent endorsement/approval by the LGSS [centre]. However, the new Local Government Act, 2016 (Act 936) seems to introduce a separated model. With the separated model, Assemblies have the authority to hire and fire their own local staff, while with the unified model, the state through the LGSS maintains their control by way of appointing mechanize staff and approving recommended local staff for replacement with mechanized ones (Olowu 2003).

### Upper Arm of the Center?

It can be deduced from the above finding that the LGSS representing the central level still holds sway with respect to the final appointment of Assembly staff as the Secretariat issues final approval for the appointment, replacement, and payment of staff (of both middle and higher level management capacities) who take major decisions in the Assembly's administration.

This phenomenon tends to suggest that Ghana's decentralization trajectory appears to be taking the sequence: A → F → P [administrative, through fiscal to political] with a very slow rate of change in intergovernmental balance of power very slow (see Falleti 2005). The central government of Ghana, after independence from the British colonial rule, was divided into 10 administrative regions mainly to extend public services to all part of the country. This

responsibility for service delivery was transferred to both central government departments and agencies as well as local councils (Awortwi 2011). Therefore, Administrative decentralization was initiated as central government was the initial territorial interest [national level] by making the first move towards the policy, leading to the demands for further reform [power reproduction feedback mechanism] from central government because of fiscal resource constraint.

Subsequently, the Local Government Act 462 and District Assembly Common Fund Act 455 were both passed in 1993 among other legal instruments to facilitate Ghana's next round of decentralization reforms – fiscal and political decentralization. This reform has granted local authorities some level of autonomy to mobilize resources to implement local programs. However, these resources do not seem to be adequate to engage and pay highly skilled staff on their own. Hence, the reliance on the central government for this class of staff. With respect to political authority at the subnational levels, the political head of the Metropolitan, Municipal, and District Chief Executive (MMDCE) are appointed by the central government [President] which makes the former more vulnerable and subservient to the centre (see Yeboah-Assiamah 2014). The sequential analysis of Ghana decentralization reform is depicted by Fig. 2.

Figure 2 suggests that the autonomy of local governments in Ghana connotes a type 2, which according to Clark (1984) involves initiative without immunity. Thus, even though they are empowered by laws to regulate the behavior of their residents, they lack the power to freely act without approval or close supervision from central government and its agencies (see also Yeboah-Assiamah 2014). This argument also affirms previous studies on decentralization (Naidoo 2005; Ishii et al. 2013; Sakyi 2008) that central governments withhold some degree of power thereby limiting the extent of decentralization. For instance, Ishii et al. (2013) found in the Philippines that responsibility for Human Resource Management at the local government had been devolved to the local chief executive. However, when it comes to recruitment and selection, the local government has to resort to the process laid down by the central government. Sakyi (2008) also observed in Ghana that transfer of management decision-making and planning authority was rarely operational at the district level with control over personnel and financial decisions remaining centralized.

## Impact of the Current Recruitment and Selection Process

### Good Side

Responses on impact of the present decentralization on recruitment and selection revealed some prospects. The current process is effective which has therefore enhanced performance. It has also eased the burden of CSC.

**Recruitment and Selection into Ghana's Local Governments: Theory and Practice, Fig. 2** Sequence of decentralization reforms in Ghana from 1957 to 2017

It was also established that the decentralized process allows Assemblies to recommend competent applicants with local knowledge to be appointed towards effective and enhanced service delivery and performance. This also is in line with Grindle (2007) that the decentralized process enhances the capacity of local Assemblies by delivering a form of public sector modernization. A principal officer at GWMA underscored:

> The current appointment process is effective because it gives us the opportunity to choose the people by ourselves factoring their competency, experience and qualification for approval

Also, the current process has been effective and increased performance of the Assembly due to the fact that personnel are not just posted to the Assembly but based on gap analysis, they actually contributes their expertise towards effectiveness of the MMDA in it service delivery. This finding is consistent with that identified by Ahwoi (2010) in advancing quality and effective service delivery.

### Hurdles to Cross

Even though all the respondents were of a positive view, some had reservations. It was indicated that the process is challenged by delays in salary processing for newly appointed staff, inadequate HR capacity, organizational conflict, absence of advertisements for vacant positions, as well as staff refusal of postings or transfers to rural areas. It was also identified that the process is sometimes influenced by nepotism, favoritism and political interferences.

> payment of salary is the decision of Head Quarters. And it takes a very long time for people to be paid. It is inconvenient for people to borrow money to go to work whiles waiting to be paid for as long as 12 months

Delays in paying salaries make it very difficult for new personnel to fully integrate and contribute their expected efforts as they lack the motivation and commitment to do the job, hence, affecting the Assembly's performance. This has always been a challenge even under the current structures.

The absence of advertisement of vacant position was also noted as a challenge to the process. From the Assembly, some respondents opined that vacant positions are usually realized after new staff are appointed to fill them. This practice disregards the pool recommended by Gomez-Mejia et al. (2012) limiting the selection and appointment process to local and mechanized staff who seek promotion to higher positions.

On staff refusal of postings or transfers to rural areas, a principal officer explained:

> I have observed that the selection and appointment is often skewed towards places in Accra and other cities due to refusal of posting to rural areas. The staff strength of Assemblies in the cities is higher than that in the rural areas

Most personnel refuse posting or transfers as they lack confidence in the posting process, authority and/or the location of transfer. This impedes efforts to improve capacity of Assemblies in rural areas. This constraint according to Wood (2000) is the most predominant capacity constraints at local levels. The finding again validates Sakyi (2008) that lack of commitment is a factor obstructing the implementation of management decentralization in the districts.

Nepotism, favoritism and political influences were also noted as challenges affecting the current decentralized structure. This was evidenced when a key informant at GWMA disclosed:

> the MCE, Regional Minister and other politicians take advantage of the absence of advertisements in the process and recommend their cronies for the job in exchange for political support

The respondent, however, appeared to be charitable in the submission by sharply adding:

> . . .these candidates are only selected upon satisfying basic requirements of the job as well as passing mandatory interviews

Earlier findings indicate that these local institutions are often denied the pool of highly qualified candidates as they fail to advertise job openings on a wider platform accessible to the general public such as newspapers, internet, and notice boards. Rather, they resort to unsolicited applications that were received earlier. However, regarding the argument above, information on job specification seems to be mostly leaked to

politicians who in turn recommend their supporters who might meet the job requirements. This finding buttresses an observation by Ishii et al. (2013) that recruitment and selection in local government are influenced by politics. This revelation on decentralization and neo-patrimonialism corroborates similar observations elsewhere (Galiwango 2008; Ishii et al. 2013). Devolving recruitment and selection to local bodies ended up in undue favoritism, nepotism, and neglect of meritocratic principles for ascriptive considerations in personnel selection (Galiwango 2008). In Uganda for instance, Galiwango (2008) observes that it is largely impossible for an individual to get recruited and selected into the DSC [District Service Council] "unless one was a campaign agent of the ruling [district] chairperson. It has become one way of appeasement and entrenchment for incumbents" (p. 206). It is this same DSC which will be in charge [4-year term] of recruiting and selecting individuals as personnel in the local government. Arguing on partisanship, nepotism, and favoritism attitude of DSC, the author further added, "it is difficult to secure a [local government] job in the district unless the councilors have talked to the chairperson . . . the DSC is just a rubber stamp" (p. 209).

## Conclusion and Policy Implications

This chapter examined how local government staff in Ghana are recruited and selected within the framework of decentralization and local governance. It was established that staff needs are foremost determined by the use of Needs Assessment forms which are distributed to all units of the MMDAs. Information from this document is then compiled comprehensively into an HR Plan based on which professionals are recruited and appointed for the various MMDAs. At the Assembly level, unsolicited applicants are shortlisted and invited for interviews. Successful candidates are made to submit medical reports, and then the final appointment is given to local staff for their acceptance. New staff are finally given assumption of duty. The LGSS appoints and approves the recommendation of mechanized staff, while HR unit of respective local governments [such as GWMA] also engage and pay local staff and when necessary, recommend them for replacement with mechanized staff that leaves.

Meanwhile, the Head of Local Government signs the appointment letters of mechanized staff and also approves recommended local staff for replacement, while the Coordinating Director (CD) at the GWMA or HRM on the CD's behalf signs that of the local staff. This means that the central government through the LGSS still holds sway. This is because the Secretariat still gives final approval for the appointment of staff in the middle and higher level management capacity as well as approving recommended local staff for replacement with mechanized staff. This suggests that Ghana's decentralization reform takes the administrative → financial → political decentralization path which explains the current level of central government control.

Lastly, it was discovered that the current decentralization structure on recruitment and selection of local government staff has chalked some successes in terms of linking job analysis to selection as well as easing up the burden on Civil Services Commission (CSC). Notwithstanding these positive gains, challenges of delays in salary processing for newly appointed staff, the absence of advertisements for vacant positions, as well as staff refusal of postings or transfers to rural areas were noted. It was also identified that the process is inherently influenced by nepotism, favoritism, and politics especially when official advertisement and recruitment has not been done for a longer period of time yet selection goes on. The chapter argues that without advertisement to create a pool of more qualified job seekers, the selection process is more likely to be shrouded with nepotism, favoritism, and political patronage, which may be a recipe for compromising meritocratic public personnel functions at the local level.

From the above observations, it is plausible to conclude that there has been an institutional

incremental change in the recruitment and selection processes with the enactment of Local Government Service Act 2003 (Act 656) shifting the responsibility from CSC to LGSS. The central government in the decentralization policy has over the past decade controlled personnel decisions of MMDAs as it grants final appointment, pay, and approve of all middle and top management personnel and still does under the new dispensation, especially for the core local government staff. The current recruitment and selection process while exhibiting some benefits is still confronted with significant challenges, which require the attention of policymakers.

To improve recruitment and selection processes of the needed human resources under the decentralized structure, policy makers and practitioners should consider intensifying a liaison between LGSS and MMDAs concerning job situation analysis and staff posting to the Assembly; develop structures and procedures to speed up appointments, approvals, and salary processing for staff; emphasize competence and eliminate undue political and social consideration from appointment; and introduce an online system to receive, process, and track job applications to ensure speed, credibility, and fairness as well as save office space in the recruitment and selection process.

## Synonyms

Bureaucracy; Meritocracy; Public service; Recruitment; Sustainable development

## Definitions

*Recruitment* refers to the process seeking, evaluating, selecting, and placing of right candidates with requisite skills and dispositions needed for the successful attainment of the goals of an organization in a sustainable manner.

*Recruitment practices* entail the peculiar activities that often tend to characterize the game of workforce engagement such as interest sharing (*biopolitics* and *geopolitics*) in Nigeria bureaucratic processes (Ukeje et al. 2020, p. 370).

*Sustainable development* is defined, according to the World Commission on Environment and Development (WCED), as "development that meets the needs of the present without compromising the ability of future generations to meet their own needs" (WCED 1987, p. 47).

## Introduction

There is a desperate need for public service recruitment process reform in Nigeria if the country is to achieve the 169 targets set in the Sustainable Development Goals (SDGs). Public service recruitment practices play pivotal roles in orchestrating effective and efficient organizational performances for the attainment of SDGs. Especially, managing personnel engagement in a multicultural setting where demands of diversity and government response to such demands have exerted increasing stress on formal processes and procedures poses great challenge to policy-makers and implementers who are often cut in the web of seeking to satisfy informal demands that provide basis for legitimization of government but which often breed organizational dysfunction. According to Saleh (2018), civil service is the backbone of government. It formulates and implements core national policies and should be modernized to cope with modern-day challenges; and meritocratic recruitment can be one way of promoting effectiveness of the service. Thus, public service recruitment (PSR) practices remain an indispensable tool for attainment of SDGs policy success and sustainability. However, PSR practices refer to the trends peculiar to a bureaucracy's workforce engagement processes. In Nigeria's instance, it entails wrong recruitment and personnel selection practices such as using ethnicity, religion, politics, social networking, secret auctioning, etc. as parameters for filling employee needs of public organizations.

This entry (a complete version of this topic was published in *International Journal of Public Administration* as follows: Ukeje et al. (2020).) sets a new agenda for development agencies and

governments interested in seeing public sector reforms objectives in developing nations realized, highlighting what will, if not properly managed, endanger the attainment of the SDGs target in Nigeria by 2030. Although Nigeria plays a crucial role in Africa's economic relations, the continued underdevelopment and devaluation of Nigeria's public service is a huge concern (Offu et al. 2018) as public sector governance has remained ineffective, unpopular, and counterproductive in many respects (Ijewereme 2018) due to heavy reliance on politics of ethnicity, religion, partisanship, etc. as basis for overall human resource management (Ijewereme 2015; Ukeje et al. 2020).

However, there are prerequisites for achieving the sustainable development goals in public administration (Kauzya 2015). Literature in this area has highlighted importance of strategic recruitment practices by human resource practitioners in sustaining global best practices and citizen-centered service delivery (Ukeje et al. 2020). A key aspect of PSR that has attracted considerable empirical and theoretical attention is the concept of "administration of the applicants" in practical terms, with emphasis on who gets what, when, and how. This is evidenced in the theoretical debates on the dichotomy of politics administration against the internal ethos of the bureaucrats that are in constant battle (interest sharing) with their "ministerial political heads" in matters of PSR doings despite various administrative reforms. PSR is one of the fundamental practices of management strategy (a merit-based system) that engages the right kind of workforce for high performance indices, which will engender SDGs attainments. Thus, a strategic approach to PSR has become more important due to the increased pressures on quality service delivery globally (Randall and Senior 1994) and urgency of enacting transformative changes that give impetus to the SDGs realization drive.

The importance of effective bureaucratization in PSR practices for complex organizations has become crucial in the context of ethical administration, culture, and the New Public Service as opined by the New Public Management approach (Denhardt and Denhardt 2006). Bureaucracy without bureaucratization can provide an explanation for the underlying problems of inefficiency and ineffectiveness (Ukeje et al. 2019). Understanding the concept of PSR practices is tangential to the idea of administrative behavior and "influences" in administrative processes that have motivated greater scientific research and systematic theorization (Sharma and Sadana 1989) in recent times. This entry observes that administration of the operations of bureaucracy in social multicultural organizations in Nigeria as characterized by rules, procedures, impersonal relations, and an elaborate and fairly rigid hierarchy of authority-responsibility relationships (Maheshwari 1992) which is yet to reduce the effects of obsessive interest-sharing practice in spite of bureaucratic reforms. The above highlighted administrative experience is in sharp contrast to the position of Friedrich (1940) and Finer (1941) on administrative responsibility.

Although the New Public Service approach as proposed by Denhardt and Denhardt (2000) focuses on citizen-centered service delivery, it has failed to control the process of its applicability, institutionalization, adaptability, acceptability, and the politics of "interest sharing" arising from the internal ethos of the policy drivers or human resources (HRs) in determining the extent of service delivery mechanisms in developing nations (Bourgon 2007). Accordingly, Ijewereme (2015) has identified correlation between corruption and societal pressure, greed and nepotism, and failed and incapacitated Nigerian public service as well as impede individual worker performance and organizational development. A public service reform emanating from such pressure is the federal character principle (FCP); see Constitution of the Federal Republic of Nigeria, 1999, Section 14(3); FCC (2006). Sadly, scholarly research and investigations by government regulatory agencies in Nigeria public administration have shown that the FCP has not achieved equitable sharing and distribution of employment opportunities in government public bureaucracies (Ijewereme 2018; Idike et al. 2019) but has exacerbated ethic rivalry, cronyism, corruption, and

system dysfunction in the recruitment process (Ukeje et al. 2020).

## The Political and Economic Environment of HRM Practices

One major issue more than anything else that bothers public administration practitioners is maximizing performance of the employee amidst the actual economic and political environment. The political and economic environment was used as mediating factors between PSR practices and organizational performance. Indeed institutions impact on the activities of managers (Boon et al. 2009; Najeeb 2014). But successful implementation of HRM practices in developing countries will result in maximizing employees' contribution to organizational performance (Tessema and Soeters 2006; Delery and Gupta 2016).

Thus, this entry examined five HR practices in Nigeria, which include recruitment, work condition, job security, remuneration, training and development, and appraisal, and compares them to those of other systems. It argues that variations across systems account for differential impact of PSR practices and inform the behavior of public administrators. Unlike the advanced countries of Europe and America, for example, Australia adopted competitive principle for its federal service just a year after becoming a federation. Similarly, Canada took a major step in this direction in 1908, though coverage did not become quite as extensive as in Australia (Laz 1982). Nigeria's unstable and volatile political and deteriorating economic environment, on the contrary, has significant negative impact on behavior of human resource practitioners, leading to low employees' contribution to organizational goals (Offu et al. 2018). It equally recognizes the impact of institutional leadership style on HR practices implementation (see Vermeeren et al. 2014). In whatever context, we argue that creating mechanisms and processes that would infuse a sense of partnership in the system will result in a far-reaching contribution of the employee.

## PSR Practices and Sustainable Development in Nigeria

As Forrester (1994, p. 249) as cited in Haque and Mudacumura (2006, p. 9) remarked, most corporate, social, and governmental systems mismanage opportunities for policy gains as a result of their "dependence on erroneous intuitive solutions to complex behavior, and failing to capture information about the structure and behavior of the system in which development decisions are being made." Also:

> . . .the complex interrelationships surrounding sustainable development issues make obsolete the traditional management approaches structured on rigid, deterministic control, which assume a high degree of knowledge about what needs to be done and of certainty in a world in which the correct solutions are not always clear, and the only certainty is a high degree of uncertainty. (Rondinelli 1982), cited in (Haque and Mudacumura 2006, p. 9)

No doubt, the 17 SDGs, all directly or indirectly, need an effective public service for successful implementation. This is because, the entire 17 SDGs, 169 targets and 231 indicators require the provision of public goods or the implementation of a public sector policy and, therefore, depend on public service to coordinate, mediate, or directly provide. But the environment in which PSR and management take place is constantly in a state of flux (Ndukwe et al. 2016). This is particularly true in developing countries like Nigeria (Onah 2008). Changes are occurring rapidly across a wide range of issues. The conception of the "environment" used includes everything "outside of" a particular organization: ranging from political, social, the climate and geographical conditions, other organizations, the state of the economy, and the stage of development of the nation (Onah 2008). This implies that formal organizations and, indeed, other bureaucracies are conditioned by their environments and the conditioning is naturally mutual.

### Linking Best Practices, Job Satisfaction, and Attitudinal Change

For there to be optimum productivity in Ebonyi State public sector organizations, practices have

to adhere to international best practices both in the process of recruitment and the entire gamut of organizational performance. The conceptual model linking best practices, job satisfaction, and attitudinal change (See Ukeje et al. 2020) connects orientation exercise, workers training, motivation, political and personal interest, work environment, ethical standards, etc. to the outcomes from Ebonyi State public sector organizations. Ideally, when these factors are not managed properly and are allowed to be influenced by the demands of diversity, service failure becomes inevitable. Realistically speaking, politicians cannot ignore the dynamics of the political environment as it has a lot of influence in determining "who gets what" politically. This is why oftentimes there is the temptation to compromise ideal standards to service political machinery so as to consolidate opportunities of ascendancy to power. Ebonyi is made up of three senatorial zones, North, Central, and South. The North is comprised of predominant Izzi and Izzamgbo people as well as migrant minorities of Ezza and Effium. The Central has Ezzas and Ikwos as dominant clans, while the Oshiri, Ntezi, Agba, and Ezilo people form the minorities. In the South, the Ehugbo, Okposi, and Uburu people are the majorities with their own minority appendages. This sets up a contentious supremacy struggle, often with significant political effects among the Zones on one hand and among the intra-clan minorities and majorities on the other. The people of each of these zones have their cultural specificities which make their demands different from the rest of the others. This struggle is carried into bureaucratic arena. For instance, the South, being the minority but more educated, often engages the rest of the zones in the bout for opportunities for self-expression and preservation. They have majority of employees in state and federal bureaucratic institutions, either within the state or at Abuja where they represent the state. Thus, any politician wishing to gain the support of these various cultural groupings must recognize their demands which often tend to compromise best practices. The outcome is that as political heads struggle to balance alleged injustices from competing groups, Ebonyians have continually been short-changed in the provision of essential services that satisfy their needs due to bureaucratic ham-fistedness. How then can this be solved since politicians must protect their interest and still aspire to provide essential services to the people they rule? This is the dilemma of service providers (HRs managers) in Ebonyi State public sector.

## Theoretical Anchorage

The study adopts the system theory as its foundation. The theory was propounded by Von Bertalanffy in 1960. It opines that organization is a system which comprises various components, unit and subunits. The entire part of the system is affected by the activities of each unit which in turn transmits to the supra-system. This presupposes that any activities weather good or bad that enters or detracts a part in the system will automatically affect the entire system as a whole. It also opines that whatever is put into the system is what will be given back. The quality of the input determines the quality of the output. The quantity of the input also will tell what the output will be like (Duru and Anigbata 2015). Applying this theory therefore, the practice of pre-selecting human resource elements for public sector organizations in Ebonyi State using political influence as a major determinant is responsible for the overall system failure. The argument is that men are required to manage policies that produce outcomes and when men who do not possess the requisite skill for bringing about policy success are for whatever reasons given chance to manage public sector organizations, policy objectives is jeopardized. Therefore, managers of public sector organizations in Ebonyi State, particularly politicians, must resist the temptation to sacrifice best practices for primordial ends (See Ukeje et al. 2020).

## Conceptual Discourse

In Ebonyi State, public sector organizations' productivity and output of services were observed

during study to be at lowest ebb due to the fact that some employees in the workforce were either wrongly engaged or wrongly positioned, poorly skilled, or inadequately incentivized or poorly empowered. A number of factors must have led to that. From the first republic to the present, ethnic consciousness among Nigerians has implanted ethnic politics which manifest in party formation in the 1940s. Employees entering into Nigerian public service lack the legacies of honesty, patriotism, professionalism, and doggedness due to this. The consequence became affectionism, emphasis on "state of origin," patronage, and favoritism in the process of recruitment, where meritocracy has been sacrificed for mediocrity, thus breading inefficiency and ineffectiveness in the process of public policy formulation and implementation. HR recruitment must be thoroughly screened and should not be politically motivated; emphasis must be on skills, knowledge, experience or past records, and a reduction in ethnic consciousness of leadership and recruitment process if Nigeria hopes to develop a functional bureaucracy that support development (Omeje and Ndukwe 2009; Ukeje et al. 2020.

### Political Influence

Political influence is the major problem that bedevils recruitment in Ebonyi State. Politicians influence every recruitment exercises in the States bureaucracy. They tend to highjack almost the vacant positions whether their candidate or applicants are qualified for the position or not. In the words of Onah (2008) "political influence and interference in recruitment practices have created problems of succession to offices and the engagement of mediocres in organizations." A situation whereby millions of qualified graduates and professionals alike are rejected in the place of unqualified applicants puts question marks in the nature and value of productivity that the faultily recruited workforce will yield, especially when, if we borrow from Nwizu (2002), faultily recruited workforce is a liability to the employer. Information in Table 2 Number of respondents, total count and relative percentage count on the variables across the ministries (See Ukeje et al. 2020).

### Personal Interest

Personal interest is another cancer that has eaten the very fabrics of recruitment exercises in the State's civil service system. It contributes to low productivity and output that characterize various organizations in the State. For example, if a chief executive of an organization is parochially minded, he will resort to engaging only the people that he knows or that are of the same ethic nationality with him. Training opportunities and job placement exercise are also influenced by personal interest. Those who get posted to certain areas are not based on competence but on predetermined considerations of the "godfathers." This brings about nonperformance of public sector organizations in the State. This practice is influenced by ideological congruence, religious affiliations, tribal/ethnic cleavages, etc. They disregard the fact that organizational strength depends on workforce diversity and viability since every worker has unique potentials which are needed to be tapped if proper considerations were made the benchmark for recruitment.

### Work Environment

Work environment is very essential for human resource managers to fully understand and attune themselves to the peculiarities of the environments of their area (Onah 2008). Both external and internal or controllable and uncontrollable variables should be giving due cognizance as such. A manager who does not understand the peculiarities and intricacies of his work environment is bound to hit a rock. Such managers must be able to manage these intervening variables to create a proper and conducive work environment which encourages optimum productivity. For instance, 99.48% of respondents in Table 2 (See Ukeje et al. 2020 agree that good work environment will improve service delivery a great deal. Unfortunately, this is not the case in the selected ministries. Study discovered that workers find it difficult to hold

those in political circle accountable so as to provide for contending needs of the institutions surveyed.

### Training and Development

Training and development is the organized procedure by which new manipulative skills, technical knowledge, and problem-solving ability are acquired relevant for all employees especially the lower- and middle-level managers. Development on the other hand is a course of action designed to enable the individual realize his potentials for growth and to assure strategic positions of importance in organization. This is usually designed for executives of line managers in other to expose them to acquire more techniques and knowledge to enable them performs additional duties. Unfortunately, these organizational necessities are not considered in various organizations as exemplified in the tested ministries. 98.50%, 76%, and 93.44% respondents in Table 2 (See Ukeje et al. 2020) for Ministries of Agriculture, Women, and Social Development and Education, respectively, agreed that if exposed to proper training, they could perform more. Workers who possess minimum ability and skill are left untapped due to lack of exposure to training and development. Proper training and development improves skill no doubt which is why Armstrong (2009) submits thus:

> The employee development policy could express the organisation's commitment to the continuous development of the skill and abilities of employees in order to maximise their contributions and to give them the opportunity to enhance their skills, realize potentials, advance their careers and increase their employ ability both within and outside the organisation.

A well trained employee or a fully developed manager is a great asset to his organization. There are situations that dictate the need for training and development in any typical organization. They include:

(a) When newly engaged
(b) To reduce industrial Accident
(c) For attitude formation
(d) For reduced suspension and widen span of control
(e) When new technologies are acquired
(f) Shortage of required manpower
(g) Operational problems or inefficiency
(h) Employ morale booster
(i) Management succession
(j) Strategic planning, etc.

### Motivation

Motivational issues remain one of the sacrosanct responsibilities of the strategic human resource manager to design for implementation an effective/efficient wage and salary structure for the entire organization. Motivation does not only end in payment of salaries or wages. It requires other extra-compensatory measures in order to sustain the interest of the workforce, for example, formation of psychological relationship, gift presentations, praises for well-doing, proper communication to induce policy ownership, housing and transport subsidy, etc. The issue here is that some organizations have lost their quality staff to competitors due to lack of maintenance. They think that statutory pay alone will adequately motivate their staff. Knowledge of psychological contracts and its application is a sound organizational management strategy for implementation of motivational packages. Gone were the days when payment of salaries alone motivates workers. They (workers) are now knowledgeable of their rights, needs, and contributions and as such do demand that adequate compensatory and motivational packages are dished out to them as morale booster and sustenance of interests. Unfortunately, this is not so in Ebonyi State public sector organizations.

### Institutional Capacity

Institutional capacity/capability is another area that needed to be touched in Ebonyi State public service. The capacity of any organization determines the employment or hiring ratio of that organization. In some cases, many organizations are undermanned, while some are overstaffed. Again,

the capacity of any organization to training its staff and workforce will be largely dependent on the capacity and production responsibilities of such organization. Institutional capacity equally helps organization in managing diversity. It is this organizational/institutional capability that:

(a) Acknowledges cultural and individual differences in the workplaces
(b) States the organization values; that is, the different qualities that different people bring to their jobs
(c) Emphasizes the need to eliminate bias in such areas of selection, promotion, performance assessment, pay, and learning opportunity
(d) Focuses attention on individual differences rather than group differences

Most important is the equal opportunity in the policy which should be spelled out in the organization's determination to give equal opportunities to all irrespective of sex, race, creed, disability, age, or marital status (Armstrong 2009). This institutional capacity also enables organization to apply a work-life balance to policies which is quintessential to occupational mobility and flexibility. He aptly argued that:

> Work-life-balance policy defines how the organization intends to allow employees greater flexibility in their working patterns so that they can balance what they do at work with the responsibilities and interests they have outside work. The policy will indicate how flexible work practices can be developed and implemented.

### Professionalism

If there is anything that needs to be addressed in various organizations in Ebonyi State public service, it is professionalism and technocracy. The situation where an animal scientist becomes the Head of Department in Accounting department or a Zoologist heading a HR (personnel) department needs to be corrected. This is clearly seen during recruitment and placement exercises in various government ministries and agencies in the State public service system where job placement is not based on area of specialty but primordial considerations such as "man-know-man." This manifests itself in selection and appointment of personnel leading to poor service delivery. Professionalism demands that a well-qualified Accountant should head Accounts section, a seasoned HR expert piloting the affairs of personnel section, etc.

## The Quandary of Faulty Recruitment on Effective Service Delivery and Productivity

There is no doubt that Ebonyi State public service has made costly mistakes in recruitment of its staff. Ukeje et al. (2020) observed that the socio-cultural diversity of Nigeria as characterized by culture, language, religion, gender, etc. has influenced the practices of HRs for determining who gets employed. The problem of this recruitment malpractice is overwhelming. This is why Onah (2000) succinctly advocated thus:

> The importance of having efficient and effective procedures for recruitment can hardly be exaggerated if organizations are able to find and employ staff who consistently fulfil their roles and are capable of taking on increased responsibility, they are immeasurably better placed to deal with the opportunities and threats arising from their operating environment than competitors who are always struggling to build and maintain their work force.

Thus, the injury inflicted on organization by a wrongly recruited workforce hardly heals easily as its scars last and linger on. Hence, before organizations can embark on any recruitment exercise, care should be taken to adequately forecast the manpower need, where and when as well as taking cognizance of the HRs capacity and financial muscle of the organization. When unqualified employees are engaged in organization, their services and output dampen the image of that organization. This is because the quality of the output will not give optimum satisfaction to the citizens, thereby affecting the credibility and solvency of that institution. Ebonyi State public service has lost considerable citizens' goodwill and trust arising from service failure due to wrong or faulty recruitment of bunch of

mediocre into the system. Some organizations in a bid to correct the mistakes do embark on mass retrenchment and disengagement of their workforce. This situation has worsened the matter as the amount of losses incurred and the number of legal battles faced by the organization often lead to deepening of legitimacy crisis. Essentially, HR potency and solvency fail among others due to:

1. Lack of understanding/orientation
2. Personal/interpersonal conflict of interest
3. Lack of institutional training and development initiatives for all employees
4. Lack of good leadership influence and capacity
5. Biopolitics and geopolitics
6. multi-cultural beliefs and practices

## Findings and Implications

Research findings from selected ministries in Ebonyi State Civil Service (EBSCS) show that practices have not adhered to international best practices both in the process of recruitment and the entire gamut of organizational performance. A recent study in Ebonyi State public service (see Ukeje et al. 2020) connects orientation exercise, workers training, employee motivation, political and personal interest, work environment, ethical standards, etc. to the outcomes of public sector organizations. When these factors are not managed properly and are allowed to be mediated by the demands of diversity, service failure becomes inevitable. Realistically speaking, most politicians in developing countries cannot ignore the dynamics of the political environment as it wields enormous influence in determining a system of resource allocation (including positions, offices, etc.) politically. This is why oftentimes there is the temptation to compromise ideal standards to service political machinery, consolidate opportunities to power, and massage personal aggrandizement. Ebonyi is made up of three senatorial zones: North, Central, and South. The North comprises Izzi and Ezzamgbo, as well as migrant minorities of Ezza and Effium clans. The Central has the Ezzas and the Ikwos as dominant clans, while the Oshiri, Ntezi, Agba, and Ezilo people form the minorities. In the South, the Ehugbo, Okposi, and Uburu people are the majorities with their own minority appendages. These peculiar configurations of the people and their ethnographic distinctions and characteristics breed grounds for continuous supremacy struggle, often with significant political effects among the zones on one hand and among the intra-clan minorities and majorities on the other. The people of each of these zones have their cultural specificities, which make their demands different from the rest of the others. For example, the South is by far in advanced stage of cultural development, being exposed early enough to formal education. Hence, they easily dominate the public sector. However, they are the minority in the state. While they rely on their knowledge and exposure, the rest of the people rely on their overwhelming population to attempt to influence public policies in their favor. This unhealthy struggle has permeated through the bureaucratic arena. Al-Gazali (2011) posits that public bureaucracies should be administered by knowledgeable, core-competent people and professionals/technocrats for effective and efficient service delivery. Thus, effective service delivery and quality is influenced not only by the service outcome but also the service process (Sibanda 2012). Accordingly, some have argued for "contractualism" (see Hughes 2003; Chalmers and Davis 2001) contending that public policies are best implemented through contractual arrangements where emphasis will be on outcome. The Friedrich and Finer's debate centers on who are best positioned to implementing public decisions. Observations in the study area show none of these theories is workable. We examined the ideals of Friedrich against the backdrop of institutional processes in the state and found that neither internal checks, professional standards, nor technical knowledge was able to bring about bureaucratic efficiency or improved service delivery. These have influenced the theories which focused on eliminating the interferences of private interests in public institutions and de-bureaucratization. However, the reasons for these institutional value infractions have not been considered sufficiently. For example, the

public sector debate has not been broad enough to include sufficiently issues relating to poverty, dependency, and lack of opportunities, that is, how they contribute to subversion of institutional rules. The government sector in many developing nations provides employment opportunities for a large proportion of their population. This brings pressure on public institutions and often stands in opposition to bureaucracy reforms. Political influence is the major problem that bedevils recruitment in developing nations' public policy processes. Omeje and Ndukwe (2009) posit that politicization of HRs recruitment remains the avant-garde practice(s) of engaging political interest by those in the public offices to fill existing and nonexisting vacancies in the public service deprived of due process. 91.73% of respondents interviewed believe that there is high political influence in the process of recruitment and that this undermines service delivery (See Ukeje et al. 2020).

## Conclusion

The essence of government everywhere is to enact quality, desirable improvements in the standard of living of the people over which it presides by promoting all-round growth and development. Indeed, PSR practices when carefully managed through a merit-based system of personnel administration exorcised of breach of process and procedure, which does not at the same time overlook necessary demands of diversity, insisting on selecting the best HRs available within a group instead of recruiting poorly skilled individuals who do not possess the requisite training and qualification needed for performance optimization in public organizations simply because the bear the endorsement of highly placed politician and bureaucrat, could provide reasonable incentive for sustainable development across various frontiers. The dynamic relationships in PSR practices and SD in a heterogeneous environment where "biopolitics" and "geopolitics" are prevalent should raise sufficient interest among practitioners and the academia in this era of SDGs. While the concept of "biopolitics" informs us of dominance of kinship determinism for PSR, "geopolitics" is used here to denote geographical characteristics for PSR. These concepts underlie the EBSCS. In practice, directives are received from the highest echelon to employ certain people for certain position in certain places without recourse to the laid down rules. The effect in EBSCS is that those employed cannot run the machinery of government effectively and efficiently. The result is a number of workers who are less committed to duties with no one to check their laxities because they came in through "big shots" in government. There is no discipline in such situation where the new employee only pays loyalty to his or her godfather in the corridors of power. Those who are better qualified but are placed far below the new employee are discouraged and will no longer give their best in achieving maximum productivity.

## Definition

Discrimination: Judging someone based on physical characteristics and using those judgments to decide that those persons are not adequate or suited for your interests.
Employability: Having the necessary knowledge, skills, and/or education to be considered a qualified candidate for a job of interest.
Equal Opportunity: Access to equal or comparable opportunities in employment.
Ethnicity: Common traits, whether physical or internal, that identify people with certain groups; this can be social, cultural, or even language practices.
Gender: Male or female identity.
Race: Physical characteristics that are used as identifiers for racial groups such as skin color, eye color, etc.
Recruitment: The process that companies engage in to hire qualified applicants to their organization for employment.

## Introduction

Securing employment means that a person has access to an opportunity that is financially empowering for themselves, their family, and the economy. Generally, throughout adolescent, individuals are inoculated with various types of knowledge that will allow them to be successful on the job. This preparation breeds hope and expectations for an opportunity to secure their dream job or simply a job that will allow them to live in a desirable manner. There are copious amounts of literature regarding the educational methods of public and private secondary and post-secondary institutions that prepare citizens for employment. Also, there is literature that speaks on the social, environmental, psychological, and structural forces that aid or hinder educational attainment and employability. While developing the skills and knowledge for employability in the job market is vital to securing employment, having the opportunity to demonstrate acquired skills is paramount during the recruitment process. The focus here is on equal opportunity in recruitment that has been enforced by administrative law to ensure equality for all American citizens in employment. Recruitment can be defined as specific processes used by an organization to identify and attract qualified candidates for employment (Holm 2012). Recruitment and equal opportunity within administrative law has facilitated diversity in the private and public sector employment in the United States. Administrative laws relating to increased employment opportunities for people can vary based on race, ethnicity, gender, culture, religion, class, age, sexual preference, and disability.

This review of administrative laws that have administered equal opportunity in recruitment is not to examine the immoral discrimination and the underlying motivational forces by white males that prohibited women and minorities and from fair hiring practices. The focus here is to consider the context, in order to refresh the minds of public administrators, of the importance of equal opportunities for all citizens and its direct correlation with increased quality of life standards. Through administrative law reform, limitations on inequities has been dismantled and eroded as rules have been adopted both formally and informally, thus seemingly normalized. A closer look at the challenges to recruitment and the positive outcomes will serve as reminders for public administrators to think critically about their hiring practices and responsibilities. Equal opportunity in recruitment is critical to life fulfillment on an individual microeconomic level, but also it is

critical to overall economic production. First, there will be an explanation on the historical context of administrative laws that served to remove barriers of discrimination. Second, an explanation of the executive orders that birthed impactful administrative laws and agencies to enforce equal opportunity in employment. Then a synopsis of the challenges of enforcing equal opportunity law and the benefits resulting from these laws are described.

## Historical Context of Equal Opportunity

This section briefly covers some contextual information relevant to the twentieth century as several administrative laws were passed through federal legislation to enforce equal opportunity in recruitment. The nation's constitution was founded on promise to ensure freedom, equality, liberty, and justice for all. However, justice for all was not inclusive of all people on American soil because many groups of people were marginalized and prohibited from full participation in American citizenship. There are many examples of discriminatory behavior from the government and private sector which barred several groups from entrance into equitable access to housing, education, and employment.

The Supreme Court's ruling of the Civil Right Cases of 1883 ruled that a host of discriminatory behaviors by organizations and citizens were legal and the equal rights afforded to African Americans in the 1875 Civil Rights Act were unconstitutional. At the beginning of the twentieth century, the federal government faced rigid southern segregation codes and laws, both formal and informal, which perpetuated discrimination against minorities and women in employment. As the United States promoted equity and democracy worldwide, leaders from other nations began to point out the hypocrisy of American democracy: their lack of equal treatment for all citizens (Skrentny 1994).

In essence, the nation needed to live up to its democratic foundation and ensure inalienable rights for all; this was able to happen through increased access to education and employment. Equal opportunity in recruitment included a host of groups, but the disparate treatment between white and black applicants was most visible to the nation. Gender discrimination was also apparent as women were informally and formally prevented from the same opportunities as men. Executive orders from presidents that created laws and agencies served as remedies for the aforementioned disparities.

## Executive Orders and Administrative Laws

As equal opportunity labor laws were deliberated throughout the twentieth century, several agencies and organizations were instituted to enforce the laws throughout the nation. It takes time for laws to become internalized by citizens who have behaved in opposition to them throughout their lives. In 1941, President Roosevelt extended Executive Order 8802 to prohibit discriminatory practices by federal defense contractors (Skrentny 1994).

Roosevelt's order was intentionally ignored. A lack of enforcement by the government contributed to minimal adoptions of the law (Hill 1977). In 1953, President Eisenhower proposed Executive Order 10479, which attempted to enforce equal opportunity for qualified candidates for federal contracting positions. This executive order still needed more enforcement because changes in recruitment were slow to be adapted because of racial differences and tensions toward including minorities and women in the workplace.

In 1961, President Kennedy's Executive Order 10295 proved to be a hallmark statement of governmental support of equal opportunity in employment. Furthermore, during President Kennedy's tenure, he developed the President's Committee on Equal Employment Opportunity to force government contractors to adhere to non-discriminatory behavior in the hiring and treatment of their employees (Skrentny 1994). Kennedy hoped that this legal enforcement would "end job discrimination once and for all" (MacLaury 2010). With this order, he demanded that contractors "take *affirmative action* to ensure

that applicants are employed without regard to their race, creed, color, or national origin" (MacLaury 2010). President Johnson furthered the committee by creating two groups after the passage of the Civil Rights Act of 1964 which were the Equal Employment Opportunity Commission and the Office of Federal Contract Compliance Programs.

The Civil Rights Act of 1964 was monumental; it reaffirmed the nation's democratic commitment to equality in the United States by the federal government. It served to prohibit discrimination in a broad array of private conduct, including public accommodations, governmental services, and education. One section of the Act, referred to as Title VII, prohibits employment discrimination based on race, sex, color, religion, and national origin (Hill 1977). This applied to private employers, labor unions, and employment agencies to prohibit discrimination in recruitment, hiring, wages, assignment, promotions, benefits, discipline, discharge, layoffs, and almost every aspect of employment (Hill 1977).

## The Equal Employment Opportunity Commission

Title VII of the Civil Rights Act of 1964 also created the US Equal Employment Opportunity Commission (EEOC), a new government agency in charge of enforcing equal opportunity in employment by investigating charges of unlawful employment practices (Skrentny 1994). The agency faced an insurmountable task of preventing employment discrimination in the Jim Crow South and nationwide. During the first year of operation, the EEOC experienced fiscal and operational challenges as over 8,800 complaints were received (Skrentny 1994).

President Johnson's perspective exemplified the growing consensus on the importance of equal employment opportunities and the relationship to civil protections offered by the government and on a person's quality of life. In 1965, President Johnson signed Executive Order 11246, which prohibited federal contractors and federally assisted construction contractors and subcontractors from discriminating in employment decisions on the basis of race, color, religion, sex, sexual orientation, gender identity, or national origin (EEOC n.d.). Government contractors showed contempt to federal law by continuing discriminatory practices in employment as they felt that their private company status should exempt them from such regulations (EEOC n.d.).

The Equal Employment Opportunity Act of 1972 granted the EEOC more control as the promises of equal job opportunities were unrealized and the EEOC they lacked the capacity to apply investigative findings to enforce federal laws. This amendment to Title VII gave the EEOC more litigation authority, and it expanded to hold all levels of government and educational institutions accountable. It was important that the EEOC's authority was increased as hostility toward plaintiffs on the job rose; plaintiffs were harassed or unlawfully fired (Sacks 1986). The inequities in hiring, promotions, and pay continued subtly through informal practices. As time passed, the social environment became more accepting of minorities and women in the workplace, but informal practices persisted to keep women and minorities away from certain opportunities.

Although not conclusive, the following prominent administrative laws have served as amendments to Title VII: The Pregnancy Discrimination Act of 1978, which made discrimination against pregnant women unlawful; The Rehabilitation Act of 1973 was the foundation for the Americans with Disability Act of 1990, which made discrimination against qualified applicants with disabilities unlawful; The Civil Rights Act of 1991 allowed for better support for plaintiffs in employment discrimination suits, which primarily permitted compensatory awards and/or reimbursements of litigators fees (EEOC n.d.). This was critical because victims of discrimination were commonly in financially poor positions and could not seek legal redress because of their lack of knowledge of the legal system and/or financial incapacity (Sacks 1986).

Navigation of equal employment administrative laws and court rulings show that laws and regulations continued to evolve to protect more

citizens. Moreover, these attempts originated in the government contracting relationships and expanded to private sector, educational institutions, and all levels of government. Federal mandates to remove employment barriers have considerably impacted how organizations carry out their human resources functions. The cultural opposition to these mandates has ranged from resentment to claims of unjustified preferential treatment, especially in response to affirmative action (Hill 1977). The wide-ranging views and controversial nature of this topic illuminates the deeply rooted issues that have historically divided our nation and has made removing employment discrimination so challenging. The following federal agencies including the EEOC all play a role in facilitating equal employment hiring practices: the Department of Justice (DOJ), the Office of Personnel Management (OPM), and the Office of Civil Rights (OCR).

## Challenges to Equal Opportunity

After an overview of American politics and administrative law in the twentieth century, the challenges of creating equality in general are apparent. These challenges become more magnified in the recruitment process. Negative connotations of cultures or identities that seem outside of the cultural norm become harsh stereotypes. These misguided stereotypes identify people through their language, appearance and values, which serve as discriminatory bases for hiring managers. Even without those contextual considerations, one can imagine how challenging it is to hire someone without any bias, as there are diverse qualities that may represent hiring managers' self-interests that they favor over others.

Challenges arise in various areas before applicants are considered qualified. Firstly, it lies in the level and type of education they have received. This is often the result of their family dynamics, social environment, and a host of other variables, which cannot be controlled by employers directly. Equal opportunity enforcement through data collection and reporting is another challenge, because it is difficult to assess the equitable representation of underrepresented groups in employer personnel.

Embracing diversity is another challenge, diversity of ideas, cultures, languages, and a host of other differences. Another challenge for companies is changing their culture, to embrace diversity. Policies and laws are in place, but they do change informal and formal practices and procedures when it comes to discrimination in employment. A great question persists for hiring managers, which is how to change company cultures to embrace diversity. In the 1980s, it was common for people to believe that time, education, and persuasion as opposed to enforcement of law were better means of ensuring participation in anti-discriminatory actions (Sacks 1986).

Technology and social media have impacted the recruitment process in the twenty-first century. Now, hiring managers can search the Internet to find their applicants online with several types of profiles that have identifiable information, as well as pictures. Managers can virtually assess someone without even looking at their resume, which could lead to discriminatory practices. Finally, hiring without any bias is a challenge, and it will always be a challenge, regardless of demographic considerations because hiring managers tend to favor employees who they think will fit in. Fitting in may simply mean that an applicant who looks, feels, thinks, and/or believes like them will work best in their organization. According to research by Lauren Rivera, the most common trait desired in the job interview process was similarity and finding a cultural fit, in essence, someone who will "fit in" (Rivera 2012).

While challenges exist, the positive outcomes from changes in legislation are plentiful and should be appreciated. Some of the positive outcomes include acceptance of diversity as necessary by governments and private sector employers, allowing them to be responsive to the people they serve (Volkner Davis 2003). Administrative laws are now normalized and followed and upward mobility of protected groups is visible. The fact that diversity is not only required but celebrated is a huge win for equal opportunity efforts over the last 50 years. There is a multitude of administrative laws that enforce, investigate,

and examine hiring practices in public and private organizations to hold them accountable. Accountability is critical when adopting new laws, and laws become normalized when organizations embrace them informally and formally. Socially, the upward mobility of minorities, women, foreigners, and disabled individuals is visible, and they have succeeded because of law changes and cultural shifts (Tien 2000).

## Conclusion

In conclusion, this entry examined the history of administrative laws that have served to reverse harsh discriminatory behaviors in recruitment. The rise of agencies to adapt to challenges in equal opportunity and enforce laws has served as strong cornerstones to the evolution of equal opportunity employment. Diversity in higher education has aided the efforts of equal opportunity administrative laws as diverse applicant pool are more common (Tien 2000). Diversity is celebrated more now than ever. According to the Pew Research Center, the demographics of the United States will shift dramatically by 2060; the forecasted percentages are as follows: Caucasian 46%, Hispanics 24%, Asian 14%, African Americans 13%, and all other 3% (Cohn and Caumont 2016). The future cannot be fully embraced without the concept of diversity. It may seem elusive but a pursuit of equality is better than a blatant disregard for it. In President Lyndon Johnson's remarks at the Howard University's Commencement Ceremony on June 4, 1965, he affirmed the importance of equal opportunities for minorities and women when he stated, "Thus it is not enough just to open the gates of opportunity, all of our citizens must have the ability to walk through those gates" (Johnson 1965). After a full speech of how discrimination and broad injustices deflate hopes of living the American dream, President Johnson described the challenges of enforcing equality standards. He elaborated on how difficult it has been for administrators and the failure of the American government, but he offered a solution, "Jobs are part of the answer, they bring the income which permits a man to provide for his family" (Johnson 1965). Jobs are still the answer today; administrative law reform is inevitable as our nation continues to evolve. Equal opportunity in recruitment through administrative laws has served to allow more people of historically and contemporarily denied groups to provide for themselves and their families.

## Synonyms

Dependency power; Fragmented bureaucracy; High costs; Leveling bureaucratic inertia; Resistance to change; Uncertainty

## Definition

Leveling bureaucratic inertia occurs at the individual, group, organization, and inter-organizational level. In this leveling bureaucratic inertia, organizations perpetuate the establishment of the path dependence rules and procedures, regardless of whether they are counterproductive or potentially specifically inverse built-up hierarchical objectives. In all these levels, bureaucratic inertia occurs when bureaucracy resistance to change, wherein individuals have no willingness to learn and the ability to make any organizational improvement. History, culture, and tradition are among the factors, which influenced bureaucratic inertia not only at the individual level, but also at the level of organizational networks. Bureaucratic inertia causes high costs, dependency in power, and uncertainty, which ultimately leads to a fragmented bureaucracy.

## Introduction

The terms "inertia" and "resist to change" – used sometimes interchangeably – are used primarily to refer to the physical phenomenon first described by Kepler, Galileo, and Newton, the tendency for a body to persist in a state of motion or rest unless there are forces acting upon it which have three kinds of inertia: inertia in individuals, inertia in social and political structures, and inertia in the development of knowledge and concepts (Zantvoort 2015). Individuals do not want to change because they have "safe zone." At the level of organization, members of organization try to delay from innovation in order to protect their interest borne out of their habits and old rules.

Bureaucratic inertia is an older and larger bureau and becomes subject to inertia because of "sunk cost" represented by its established rules, habits, procedures, and interpersonal network of communication and authority (Downs 1967). Due to established rules and procedures, bureaucracy resist to change from what is originally mandated by the policy and/or only partially absorb change at one bureau level and may be completely absorbed by the other (Congleton 1982). Those old ideas on bureaucratic inertia clearly affect how the current institutionalism scholars define it. North (1984, 1990, 1991) and Williamson (2000), stated that bureaucratic inertia is mainly affected by the outcome of a complex process of playing the economic game according to formal and informal rules that provide incentive structures and channel innovative activities in a certain direction. It means that stakeholders can be successful in using and managing their resources if they can meet their institutions with its contexts

(Ostrom 2008), in which the different contexts and cultures can create different institutions because the same rule cannot be executed in different social contexts (Agrawal 2001).

## Bureaucrats

Therefore, the development of effective local institutions should rely on the local contexts and cultures. A specific institution with a defined context is the best way to deal with resources and environmental issues. Colloquially speaking, bureaucracy means red tape, overcontrolling bosses, and apathetic employees (Adler 1999). What is the bureaucracy profile? To understand how local officials as units perform their tasks, the analysis takes a system views of local agency, by controlling multiple internal and external circumstances known to be associated with organizational performance (Gazley 2014). Bureaucracy agencies are the government's means of carrying out public policy, and their capacity for effective performance is clearly central to how any rational politician, interest group, or citizen would go about in understanding them or assessing their value (Moe 2012). Internally, Wilson (1989) divides officials in bureaucracy into operators, managers, and executives. Operators placed at the front line have different behaviors in facing field problems.

In other words, the performance of their (frontline workers) task depends on circumstances, beliefs, interests, and culture. The frontline workers define the organizational task to vary depending on whether they are supervised and the imperatives of the situation they confront daily (Wilson 1989). The imperatives of the situation, more than the attitude of the front workers, shape the way tasks are performed (Wilson 1989). What is the real task of the frontline worker? Their tasks depend how the frontline workers define the task based on their prior experiences, professional norms, and bureaucratic personality.

Operator tasks are shaped by the pressure of external interests and vary depending on which of the four political environments surround the agency: the extent to which the legislature wants and expectations has an impact, the degree of discretionary authority, the array of interest in the agency's environment, and the relationship between desired behavior and client incentives (Wilson 1989). The last important factor affecting the frontline worker is organizational culture. Culture is the central task of human relationships within an organization (Wilson 1989).

Manager or the middle-range worker in bureaucracy is shaped not by the tasks the operators are performing or the goals the agency is serving but by the constraints placed on that agency by its political environment (Wilson 1989). The constraints of government agency (1) cannot lawfully retain and devote to the private benefit of their members the earnings of the organization, (2) cannot allocate the factors of production in accordance with the preferences of the organization's administrators, and (3) must serve goals not of the organization's own choosing. Managers in craft agency have core activities as a compliance officer who has an investigative function. Their service relies on the ethos and sense of duty of its operators to control behavior (Wilson 1989). At the higher level of government agencies is the place of executives. The main tasks of executives are to maintain their agency autonomy (Wilson 1989). Maintenance means assuring the necessary flow of resources to the organization through political support and high budget (Wilson 1989).

### Leveling Bureaucratic Inertia

Bureaucratic inertia has five main mechanisms: (1) cost, (2) uncertainty, (3) path dependence, (4) power, and (5) legitimacy. Costs can be divided within the literature into two main subgroups: costs of "free-ridership" and "transaction costs." Rules, norms, routines, cognitive scripts, and standards for behavior existing institutional structures support incumbent actors; in subordinate groups are hindered to exert pressure.

Organization culture emphatically impacts the part of conduct. This impact can separate one organization from others. It likewise can

make association personality and part character, association duty above individual responsibility, and the soundness of social framework solidarity. It likewise works significantly in creating instrument of conduct controlling images of individual relations in achieving organizational goals and satisfaction.

Organization culture is an arrangement of framework containing image, esteem introduction, conviction, learning, and beneficial experience embedded at the individual's mind. Hence, it contained: Artifacts, which refers to obvious and unmistakable conduct example such: language, oral discourse, composed discourse, bureaucracy plan, bureaucratic structures, dress and custom; (b) conviction and esteem as seen from the individual's communication style. Noticeable conduct of individual behavior and governmental support to the public at large, is also shown as one of the forms of organizational culture. Great dialect, neighborly and justifiable, is an immediate correspondence between the authority and society. Embraced an incentive in a general public is an arrangement of shared standards that ought to be actualized by all gatherings. Organizational strategies are made by the organization to maximize the benefits. Whereas, it should be obeyed by all staff in directing their works. Along this line, the organization keeps the conduct of staff in leading predominant control.

On the other hand, bureaucracy issues are influenced by universal standards, guidelines, and administrations that direct residential administration in different territories of economy, governmental issues, society, culture, and organization. Numerous issues are currently ending up all-around concerned issues which request aggregate innovation and aptitudes, for instance, urban administration conveyance, crisis and security issues, destitution and lodging issues, air and water contamination, and wrongdoing and different issues.

Bureaucracy inertia is the resistance of any adjustment in its condition of movement; this incorporates changes to its speed, bearing, or condition of rest. It is the inclination of items to continue moving in a straight line at consistent speed. Bureaucratic inertia portrays the propensity of managerial organizations to confuse their operations to the detriment of achieving their unique objectives. The more complex procedural systems in an organization, the additional time it will take to arrange those techniques, which implies that it will be more troublesome for the staff to accomplish the task or assignment intended to be completed. In doing so, bureaucratic development is hindered.

Furthermore, the tendency of bureaucratic organizations to perpetuate themselves is inevitable. The perpetuation of bureaucratic organizations is done through procedures and modes, even if they are counterproductive and/or diametrically opposed to established organizational goals. Organizational practices are constructed around the belief that bureaucrats know best how to translate broad legislative mandates into specific regulatory decisions for the public interest. In governance, the preferred institution is best entrusted to a bureaucracy operating the procedures and system to implement governmental mandate and services. Hence, bureaucracy must be on one hand, remained neutral against the pressure of electoral politics and the caprices of the public-at-large on another.

Bureaucratic inertia mechanisms occur starting from the individual level due to the unwillingness and the ability to learn. In the organization, there are individuals who are categorized as free riders who benefit from the organization but do not contribute to the organization. These individuals have no willingness to learn and the ability to make any organizational improvement. In turn, the greater the number of free rider individuals, the more troublesome the team or working group in the organization to make changes since they tend to oppose improvement. Their cultures, habits, and norms are preventing individuals from learning. Organizational structure's objective is mainly to make more efficient transaction cost. However, under this condition, the costs of governing will increase such as information costs, bargaining costs, and cost of enforcing transactional agreement uncertainty and frequency, and the persons involved in the transactions, such as

being bounded rationality and potentially opportunistic (Williamson 1989).

At interorganizational level, unorganized and fragmented bureaucracies will increase the transaction cost, because these mechanisms involve a collective decision process encompassing multiple policies and actors and delegated authority (Feiock 2013). Multiple government units consequently create multiple policies, and preferences for cooperation are not homogeneous in which they vary according to a country's history, culture, and traditions in which they are embedded (Tavares and Feiock 2014). History, culture, and tradition will certainly affect not only to individual level or team but also the model of organizational network. Untrustworthy individual relationship will extend untrustworthy group relationship also. In other words, social embeddedness helps to mitigate opportunism because long-term interaction builds reputation among potential partners and prevents untrustworthy behavior.

Inertia bureaucracy point out that bureaucracy resistance to change will cause the uncertainty. Without bureaucracy capability to accommodating the change and uncertainty to where it is needed most, any goals and policies they are implementing will not impose significant impact on society. In a bureaucratic organization, external factors such as changes in technology applications, regulatory inventive administration, and more innovative service demands are challenges that require rapid bureaucratic response. But this rapid response should frequently not be done by the bureaucracy on the grounds that the position of inertia of organizational units prompts to uncertainty situations occurring within the work unit level.

Since individuals in organizational units frequently decline to react to changes that require the ability to learn ceaselessly, what happens is vulnerability in the organization. For instance, when society demands a public service innovation to enhance the advantages of services, at that point what happens is organizational units sit tight with each other to make advancement to create innovation in public service, resulting in a situation of high uncertainty.

Bureaucratic inertia is also seen as the tendency of bureaucratic organizations to perpetuate the established path dependence rules and procedures, regardless of whether they are counterproductive or potentially specifically inverse built-up

hierarchical objectives. As a matter of first importance, this is identified with the development which if unchecked proceeds with the organization success or failure. Furthermore, after experiencing such uncertainty, organizations encounter what is referred to as process dependency and performance of each other or path dependency. Bureaucratic inertia usually leads to low performance due to the high process dependency and interunit performance. When a unit in a bureaucratic organization is not able to complete its target objectives in an auspicious manner, at that point what happens is delaying the process on the other unit or postponing the procedure on the other unit. In this case, examples of cases of electronic single identity number administrations, integrated licensing administrations, tax collection administrations, and health insurance services are cases of high path dependence among hierarchical organizational units within each service provider. Notwithstanding a process that needs to depend on one unit with another, it will likewise have implications for organizational performance. Ultimately, in this path dependence, it can be seen that the process in a single unit of the organization that goes well will create good performance for the bureaucratic organization overall.

At the organizational level, bureaucratic inertia is caused by the power possessed by powerful officials. In the bureaucratic structure, the hierarchy determines the authority of officials according to the position held. Officials who are at lower levels are not conceivable to carry out operational exercises of the organization without direction and orders from authorities above. For this situation, the number of layers of hierarchy prompts a long bureaucratic structure and permits the execution of projects and exercises to be longer, because lower authorities are waiting directions and orders from upper authorities. The length of the bureaucratic chain and the level of oversight are likewise the motivation behind why bureaucratic inertia happens. The moderate instance of open government, for example, school operational aid, rice distribution for the poor, and the development of low-rise apartments indicate bureaucratic inertia occurring because of the moderate decision-making. Furthermore, it shows the process bearing the mandates and directions from higher authorities to lower authorIties in the bureaucracy. In the case of overcoming the bureaucratic inertia caused by the abuse of authority of some officials, the discretionary mechanisms in developing countries are less well undertaken. The discretionary power frequently creates inter-organizational conflict. The discretionary power of governmental officials are also with certain limitations. The power dynamics and limitations of governmental authority in terms of their discretionary powers are among the bottlenecks in the implementation of public programs, projects and activities, thus manifesting bureaucratic inertia.

Bureaucratic inertia will cause crisis of legitimacy. This is because the impact of bureaucratic inertia drives individuals to end up trust in bureaucracy and causing weak legitimation because public trust is declining sharply. The case of land titling, building rights certificates, and import-export management sometimes fall into a corruption where clients want the process to be faster. In these cases, the probability of bribery opportunities is considered to happen. As a result, public trust in the bureaucracy is decreasing, and the legitimacy of the bureaucracy fall into a low legitimate public servant.

# Redesigning Organizations for Maximum Resiliency in Dynamic Environments

Haris Alibašić
Public Administration Program, College of Education and Professional Studies, University of West Florida,
Pensacola, FL, USA

## Synonyms

Corporate social responsibility; Organizational resilience; Quadruple bottom line; Sustainability

## Definition

Modern organizations design their systems using effective sustainability strategies to withstand external and internal pressures for maximum resiliency in dynamic environments, as defined by the threats of climate change, global warming, and growing existential economic, environmental, governance, and societal pressures.

## Introduction: Resilience and Sustainability Defined

In the contemporary world, both the public sector and the private sector organizations face immense internal and external pressures. Internal pressures include a broad range of challenges from demands from stakeholders exemplified through elected officials in the public sector and the politicization of the service delivery, requests for more efficient service delivery, and requirements from the diversified and skilled workforce. External forces creating challenges for organizations consist of societal demands for equitable and environmentally friendly service provision and product delivery, financial needs, cyclical nature of the economy, fast spread of news, and the negative brand impact.

Facing ongoing threat and challenges, organizations must discard their traditional strategic planning approaches and adopt an adaptable, livable sustainability and resilience planning process to redesign systems for maximum resilience. Sustainable and resilience planning concepts are most often viewed as developmental efforts allowing humankind to meet its needs in the present without depriving future generations of the ability to satisfy their needs and requirements. As for sustainability planning, it can be broadly defined as planning aimed at long-term improvement of both human and ecological welfare. In other words, it is a set of activities aimed at preserving environmental and social capital. The necessity to apply sustainability and resilience planning arises from increasing acuteness of a range of social and environmental problems including climate change, inefficient land use, pollution, inefficient use of resources, poverty, and inequality. Visionary experts emphasize the importance of the creation of more sustainable and equitable communities while noting entrance into the new era of sustainability planning (Wheeler 2013).

Resilience is the ability of an organization or system to respond and adapt quickly to societal demands, transformation, internal and external shocks, and governing and economic, environmental, cultural, and social changes. Sustainability is an integral part of resilience, and resilience

adds an in-depth dimension to the sustainability planning, taking into account among many other threats, the challenges stemming from climate change and extreme weather events. A sustainable and resilient organization is one that is not only designed to be sustainable and resilient economically, environmentally, socially but also one that can evolve and adapt to remain sustainable and resilient through time and able to withstand the variations in governing structure.

## Quadruple Bottom Line (QBL)

The four pillars of sustainable organizations that include economic, environmental, social, and governance best explain these pressures through the Quadruple Bottom Line. In a never-ending process, combining sustainability, strategic planning, and leadership with other management processes, organizations are challenged to produce more with less, to be more productive, and to deliver more services, to be more efficient service providers. As noted in Alibašić (2017) sustainability "may be defined as a set of effective and efficient actions taken by an organization, through good governance" to ensure the fiscal endurance in producing the societal outcomes with the least negative social and environmental consequence (p. 37). Through sustainability planning, organizations must take into consideration all four pillars of sustainability and integrate them effectively into their long-term goals and objectives. It is imperative for an organizational leadership team to use strategic management and sustainability planning in response to the rapid changes occurring under present conditions.

## The Environmental Challenges

The challenges of geopolitical, financial, interdependent international, sociodemographic trends; the evolving nature of technology; and a fundamental shift in values are creating challenges and opportunities for organizations.

A slew of recent news reports stemming from the results of extreme weather events, further exacerbated by climate change including an active hurricane season impacting communities along the US islands and the mainland, have brought resiliency planning into the forefront. Cities are experiencing large scale, localized impacts of climate change and weather events, with more hospital stays, increased insurance costs, affected human resources, and stretched resources. Industries and production are impacted by long-term power outages and lack of access to fuel. Production is affected, resulting in immense insurance costs. Extreme heat events often result in hospital stays, emergency room visits, and deaths. Massive rain events often cause flooding and damage to infrastructure and pose a threat to residents and businesses. All of these issues combined cause additional cost considerations for local governments and necessitated a more adaptability to the new threats.

Contemporary organizations incorporate sustainability and resilience planning into their implementation strategies in operations to remove existential threats, uncertainties and reduce risks and dangers to their existence (Coyle 2011; Slavin 2011). Slavin (2011) argued one of the critical elements of sustainable cities included the design and management and emphasized the importance of humanity living in a way that does not alter the ecological balance. Moreover, Coyle (2011) highlighted the relevance of a low-carbon built environment (RLC) in a resilient and sustainable community and the vital role that organizations play in delivering of sustainability platforms and promises. Elements of organizations using sustainability planning include a compact and bounded development pattern, as having a supporting system that provides for economic, energy, water, natural environment, transportation, food production/agriculture, and robust waste systems that are renewable resource-based, flexible, efficient, adaptable, virtuous, and durable.

Enhancement of innovations to the existing service delivery advances future positive environmental and societal impacts. Organizations strengthening their positions in a system-based approach can experiment (Ismail et al. 2014), adapt, and proactively address ongoing threats

and for maximum performance outcomes (Poister, 2000). The importance of addressing climate change threat is amplified as the word and threats of climate change get politicized as evidenced in the case of the State of Florida and the state administrators' attempt to forbid employees from using the phrase "climate change" (Korten 2015). The resilience planning allows the process of de-politicization and rational approach to strategic planning.

## Resilient Systems

Sustainability and resilience planning became a norm for many organizations, both in public and private sectors, looking into the long-term plan from an environmental, social, economic, and governance perspective, in a systematic and purposefully defined, interconnected realm of issues and responsibilities. Sustainability and resilience planning is a relatively new development, with so many facets of the preparation that emanates from strategic management practices. The concept of Quadruple Bottom Line (QBL) is incorporated into a broad concept of sustainability and resilience planning. In a real sense of best practices, similar to strategic management, sustainability and resilience ideas can be replicated from one sector to another. Sustainability is a set of strategic management initiatives, in a relatively well-defined space and time, with long-term goals, visions, and mission using a set of interconnected areas of concerns for the organizations, including but not limited to governance, economic growth and development, social impacts, and environmental concerns (Alibašić 2017). The term of Triple Bottom Line relates to the fact that organizations are interested not only in the issues of economic, social, and environmental significance but also are involved in the best and most efficient governance of the agency (Alibašić 2017). However, an expanded definition of the bottom line includes governance; Alibašić (2017) posited and defined the QBL to include economic, social, environmental, and governance aspects of pillars of sustainability, focusing on governance as the organizational ability to address fiscal responsibility, stakeholder engagement, transparency, and accountability in order to provide for resilient, adaptable organization that can thrive and quickly recover from shocks.

Sustainability and resilience planning is the ability of organizations to create a state of an efficient and flexible system where all factors of its functions and operations can be sustained. For instance, energy consumption is a driving factor in the features and processes of an organization. Energy from fossil fuels is inherently inefficient and inflexible because it is nonrenewable, while solar, water, wind, and geothermal sources of energy are renewable and naturally more resilient. Eventually, all functions and operations of an organization or a system must use renewable energy for sustainability and resilience goals to be attained.

In cities, another essential aspect of sustainability and resilience planning includes a pedestrian-centric, rather than automobile-centric, transportation system, including accessible, affordable, convenient, and efficient public transportation as well as complete streets. Water is a visible resource that must be conserved and protected. Sustainable water systems treat water as an irreparable resource that can be conserved through water conservation and efficient stormwater collection. The rising costs of water, sewer, and energy service delivery necessitate new and more strategic, long-term view of those services, with an eye toward environmental impact reduction and social benefits.

## From Plans to Action

Organizations across the various spectrums of sectors have already started planning for resiliency to address environmental changes, climate change threats from more frequent and severe heat waves, excessive rain events, changes in temperature, and precipitation patterns. Counteracting the negative impacts of Greenhouse Gas Emissions (GHG) on social systems, environment, and the economy is done through various efforts:

energy conservation; reusing, repurposing, and recycling of materials; sustainable transportation; planting trees; building resilient infrastructure and green buildings; renewable energy; and good governance of resources.

It is evident that cities involved in sustainability are concerned about the long-term impact of climate change and that they plan for unforeseen circumstances. By using a dynamic approach to resiliency planning, cities can continually adjust and adapt to flux of economic, environmental, and social conditions as a result of new realities. Emergency preparedness and climate resiliency are linked, as the impact of the climate-related events on the environment, and public and private property, cause cities to adopt preventive measures.

Given rising attention of communities to social and environmental problems, sustainable and resilience goals attainment become increasingly relevant. Today, sustainability planning in public sector is most often implemented as sustainability targets integrated into strategic plans. Strategic planning and sustainability planning become more interwoven since sustainable goals become a part of the mission and long-term vision of public sector organizations responding to the community needs. Sustainable goals are promoted through a range of initiatives. For instance, they may include waste management planning, enhancing public transportation quality, energy saving initiatives, and redevelopment of vacant lands to promote green economy (Rosan 2012). Sustainability and resilience planning gives rise to the prominence of long-term thinking using the maximum resilience design approach.

## Conclusion

Due to growing number of challenges, complexities, and uncertainties in the environmental and societal spheres, planning for maximum resilience in public service and private sector organizations is critical. Challenging environment of operation requires an appropriate response from public service organizations in the form of strategic planning. Maximum resilience planning is beneficial to implement in public sector since it is associated with improved strategic thinking, enhanced decision making, better resilience and flexibility, and higher legitimacy through improved value creation. Strategic planning can efficiently support the diversification of service portfolio, improvement of operations efficiency, and formation of strategic partnerships to achieve synergy effects. In response to evolving community needs, strategic planning becomes increasingly interwoven with sustainability planning, and sustainable goals become a part of the mission and long-term vision of public sector organizations.

When compared to other strategic management tools, sustainability and resilience planning hold the most significant promise.

# Reforms and Governance

Muhammad Azizuddin
University of Tampere, Tampere, Finland

## Synonyms

Administrative change; Administrative reform; Administrative reorganization; Changed management; Governance reform; Organizational restructuring; Public administration reform; Public governance reform; Public management reform; Reorganization; Reorganization and change; Reorganization and change in government; Reorganization and change in public policy; Reorganization and government

## Definition

Reforms and governance are the arts and the science of administration and politics which correspond to administrative reform, functionally, deal with reorganization and change in the affairs of institutionally arranged governmental apparatus of a nation state for "crisis management," and ultimately achieve overall "national development."

## Introduction

Reforms and governance are the words and the sciences and widely used concepts in politics and administration relating to society, state, and government. Reform is a reorganization and change in the institutional structure and functions. Governance is a blend of administrative and managerial institutional arrangements and processes. These are typically understood in terms of relationship between state, government, and administration and closely connected to administrative reform. Reforms are enacted to strengthen governance practice, and governance is improved through reform activities. They have emerged from multiplicity of theoretical perspectives of organization and management on the political, administrative, and managerial aspects of public administration. They are otherwise known as governance reform with an overarching goal to cater the development needs of a given society, by empowering units of government both organizationally and institutionally.

## Understanding Reform and Governance

Reforms are the tools which enable governments to meet organizational challenges, creating opportunities for government to make the process of governance suitable for changing environment. Reforms are the means, and governance is the subject of reform to reorganize and change the structure and actions of government, specifically the executive branch of a government in countries.

*Reform*: Reform is a reorganization and change in the institutional structure and functions. It is the means to bring about changes in governance with time and space relations and affects the process of policy formulation and implementation in institutions, both public and private. It signifies changes in the structures and processes of government and is closely related to administrative reform, which is understood in terms of organizational and human dimensions of structural and behavioral emphasis in the realm of administrative science and organization theory (Dunsire 1976). "Structure" refers to the anatomy of an organization, while "behavior" concerns with the human dimension within organizations. This is "institutional" and regarded as a "special public policy" (Ciprian et al. 2010: 37) of a government to

reorganize organizational process of governance, dealing with "crisis management," and ultimately to achieve overall "national development."

Administrative reform is concerned with improving the efficiency of governance, organizational effectiveness in public administration, and institutional capacity building for public service delivery (Jooste 2008). The ultimate goal is to serve the development needs of a given society, by empowering units of government to deliver services effectively. It is an "artificial inducement of administrative transformation against resistance" (Caiden 1969: 1), and functionally, it is oriented toward "differentiation" (Cohen 1976). It is enacted due to "historical [factors], revolution, [changes] in circumstances, intolerable conditions, [a] desire for change, precipitating events, crises, failed states, market failures, and others" (Fuller 2010: 1) and an investment of government with the twin objectives of crisis management and national development, requiring "substantial resources of time, energy, creativity, and finance" (Caiden 1979: 143). Reorganization and change in structures and processes is, as described by Gow, "a conscious, well-considered change that is carried out in a public sector organization or system for the purpose of improving its structure, operation or the quality of its workforce" (Gow 2012: 1). It usually appears when there is a need to strengthen social, political, and economic institutions of government.

*Governance*: Traditionally, governance refers to modes of managing public institutions in terms of "effectiveness" and "legitimacy." The essence of both may be judged based on participation, the rule of law, transparency, and accountability (Hossain 2005: 05). Very simply, it can be understood by describing two "thin" and "thick" conceptions of governance. The "thin" conception understands governance as merely the set of rules by which the citizens are ruled. In this conception, governance is a synonym for government. Accordingly, the "thick" perspective is more than just the government or the set of rules of how to govern.

There is no universally agreed upon definition of the concept of governance as it is related to "government" and "state," and many traditions of these two exist in the world. In the USA and Britain, the "government" means "state." Earlier in the UK the "Crown" denotes as "state." The Anglo-Saxon idea of "state" has not been accepted in the same meaning as in the rest of Europe (Vartola 2009: 16; Dyson 1980). In academic literature the term usually refers to the development of governing styles denoting how societies are organized and power and resources are allocated. In this regard governance refers to a system of values, policies, and institutions that regulates its social, political, and economic affairs. The state, civil society, and public sector all together take part in governance encompassing the totality of institutions and systems through which decisions concerning common affairs are made.

Instead, governance is understood as a wide array of decision-making policies across many levels of society. According to this perspective, governance addresses the fundamental question of how to solve problems and meet challenges by strengthening government and other economic and social institutions, entailing government-market, government-society, and interdepartmental relationships in government.

## Scholarships and Perspectives of Reform and Governance

Reforms and governance have been studied in numerous ways across and within different countries, with schools of thought emerging in both the USA and Europe. Woodrow Wilson's classic work, *The Study of Public Administration* (1887) "began a long academic train of thought that led to [the] 21st century consciousness regarding public administration" (Crate 2003: 1). However, academic exercises began in the 1960s as the logical extension of the comparative public administration movement initiated by the Comparative Administration Group (CAG) and are considered essential in the Development Administration (DA) school of thought (Ahmad and Azizuddin 1995). The emergence of New Public Administration (NPA) originates from the Minnowbrook Conference (1968) and is a

theoretical approach to public administration that emerged in the mid-twentieth century in response to the ever-changing needs of the public and how institutions and administrations go about solving them (Kaul 1997; Nigro 2014).

During this period, reforms and governance transformed from a Weberian bureaucratic model to the NPA and Public Management approach following the New Public Management (NPM) philosophy. NPM "grew from neo-liberalism, particularly market values to the right [of] the political spectrum" (Fuller 2010: 1) and reflects "the ideas of Woodrow Wilson [1856–1924], F. W. Taylor [1856–1915] and even cameralist and mandarinate writers" (Ocampo 1998: 250). Usually, NPM reforms are part of the multi-sector socioeconomic reforms that aim at shrinking the public sector and increasing private sector participation in providing public services and economic liberalization generally (Ilkeanyibe 2016: 563). However, it "is different from the New Public Administration [NPA] that sought also to depart from progressive-era doctrines but flowered only briefly during the late 1960s and early 1970s" (Hood 1996: 268; cf. Kaul 1997, as cited in Ocampo 1998: 250) and implies a much broader notion of administrative "governance" than encountered in the early twenty-first century (Peters and Pierre 1998: 224).

Systems of government and public administration, regardless of the theoretical origins and their welfare models, face similar problems of poverty, unemployment, and unemployability. The capacity of governments to deal with these challenges relates to the nature of the state, its political will, and administrative support. Governance reform entails the transformation of administration of government from "traditional" bureaucratic models to being "developmentally" and "managerially" and "service"-oriented administration with an emphasis on "good" governance and service delivery. Traditional bureaucratic model refers to the Weberian ideal type, "development" is the development administration, and "managerial" is the NPM style of administration. Service-oriented administration is based on open-system thinking, where services are constantly developing through human resource management interactions and reforms aiming at integrating professional dealings (Stenvall et al. 2014). Reforms and governance concerned with the process of improving the structural and behavioral dimensions of an organization parallel to administrative needs and practices. "[D]ecolonization after World War II and the adoption of modernization as primary motive necessitated administrative reform" (Rahman et al. 2013: 299). Policymakers "have [been influenced by] Max Weber [1864–1920], Herbert Simon [1916–2001], the Washington Consensus [1989], *homo economicus*, New Public Management [1980s], World Bank indicators, the rule of law, [and] many other [ideas]" with the intention of bringing about changes in policies, structure, and the functions of the institutions of public administration (Fuller 2010: 1).

## Approaches to Reforms and Governance

There is a multiplicity of alternative approaches to the study of reforms and governance in varying nomenclatures and degrees within the dominions of administrative and political sciences. A list of administrative fashions has developed over the years in the area of reforms and governance. They are, namely, Scientific Management; Management by Objectives (MBO); Planning, Programming, and Budgeting Systems (PPBS); Zero-based Budgeting (ZBB); Performance Pay; Managing for Results; Benchmarking; Reengineering; Reinvention; Citizen-focused Management; Horizontal Management (Cheung 1997; Thomas 1996); New Public Administration (NPA); Reinventing Government (RG); Business Process Reengineering (BPR); Public Management; and New Public Management (NPM), including the potential trend of New Public Governance (NPG) (de Viras and Nemec 2012; Gow 2012).

Scientific Management is an early twentieth-century school of management thought concerned primarily with the physical efficiency of an individual worker, based on the work of F. W. Taylor (1911), derived from experiments in methods of work and production, especially from time-and-motion studies. Management by Objectives

(MBO) indicates a management model, outlined by Drucker (1954), and emphasizes goal setting, action plans to ensure better participation and commitment among employees, and alignment of objectives across the organization to improve organizational performance by clearly defining objectives agreed to by both management and employees. Planning, Programming, and Budgeting Systems (PPBS) is an integrated management system, developed in the 1960s, to provide a better analytical basis for decision-making and for putting such decisions into operation (DonVito 1969: 1). Reinventing Government (RG) is "a radically new way of doing business in the public sector" (Osborne and Gaebler 1993: xviii) and a "(r)evolutionary change process" that had happened before in the Progressive and New Deal eras in the USA and has been occurring again in local governments and elsewhere (Ocampo 1998: 248). Business Process Reengineering (BPR) "is the fundamental rethinking and radical redesign of business processes to achieve dramatic improvements in critical contemporary measures of performance, such as cost, quality, service, and speed" (Hammer and Champy 1993: 32). It represents "an effort to turn back the Industrial Revolution and reassemble the tasks and functions taken apart by the 19th century principles of the division of labor" (Fowler 1997: 36–37).

## Conclusion

Reforms and governance are an intertwined phenomena relating to state, government, and administration. Reforms serve as the tools which enable governments to meet organizational challenges, creating opportunities for government to make the process of governance suitable for changing environment. They have emerged from multiplicity of theoretical perspectives on the political, administrative, and managerial aspects of public administration. Administrative reform and reorganization is the functional tenet of the phenomena along with public administration reform and public governance reform. Since the approaching of Millennium 2000, administrative science has primarily been concerned with the question of how to achieve maximum efficiency and organizational effectiveness and improve institutional capacity (Raul 1985). Inspired by administrative practice, RG or NPM became a core topic of reforms and governance in the theoretical debates in the late twentieth century, and the countries worldwide initiated a series of reforms, which has been "an influential catchword for modernisation in governance" (Siffin 1991: 531). With the substantial increase of reform efforts with time and space relations, more work is needed to determine the accuracy with greater attention to organizational efficiency and institutional sustainability. More academic and professional exercises in the phenomenon complement bridging up the emerging gaps with ever-changing demands of society, state, government, and administration.

# Regime Changes and Public Administration in Ghana

Isaac Kofi Mensah
School of Economics and Management, Jiangxi University of Science and Technology, Ganzhou, China

## Synonyms

Democracy; Public sector; Regime change; Regimes

## Definitions

Regime: A system of government in place within a country at a particular point in time

Regime Change: The replacement of one system of government with another one

Ghana: A developing country located in West Africa

Public Administration: The implementation of government policy and programs

## Introduction

Regime change is a phenomenon which has occurred or occurs in almost every country in the world. Regime change is considered as the

replacement of one system of government or administration by another system. A regime change can either be democratic or nondemocratic such as a military takeover/unconstitutional seizure of power. The democratic change could be termed electoral regime, while the nondemocratic change may also relate to military regimes. These two types of regime changes have a significant effect on a country's system of leadership, administrative systems, governance, or bureaucracy. The military regimes are situations in which military officers are the main or predominant political personalities due to their use of force (Hadenius and Teorell 2006). The military personnel may exercise his or her political power either directly or indirectly (Hadenius and Teorell 2006). The extent of these regime changes (either democratic or undemocratic) has the potential to affect the sustainability of public administration systems to deliver good governance and social and economic development. Various regime changes both military (undemocratic) and civilian (democratic) have occurred in Ghana, and it is no doubt that these changes have had and continue to have a huge impact on the public administration systems in Ghana. The following sections are as follows: the literature on regime change theory, a brief history of Ghana and its regime changes, public administration in Ghana, discussion, and conclusion.

## Regime Change Theory

Political regimes and regime changes are the main research in the field of Political Theory and Comparative Politics (Skaaning 2006). Political regime is defined as the formal and informal organization of the center of political power and its relations with the broader society, and it determines who has access to political power and how persons who have political power interact with those who do not (Lawson 1993). It is also considered as the rules and basic political resource allocation in which the political players exercise authority and power by imposing and enforcing the cooperative decisions on or within a particular geographical constituency (Kitschelt 1992). Political regimes, therefore, play important role in the determination and allocation of legitimate power and administration of power in a particular country (Zanger 2000). A political regime was also defined as the alliance of dominant ideological, economic, and military power players/actors influenced by the governors of the country (Mann 1993). A regime change, on the other hand, has been defined as a change or abandonment in the principles and norms governing the nature of a regime and has to do with the change in the institutional structure of the political regime of a country (Lawson 1993; Zanger 2000). According to Zanger (2000), the direction and focus of regime changes have to do with the changes made to the rules of the political game but not on changes in the leadership within a particular governing elite. He elaborated further that, for instance, if a new leader takes charge of a new government of a particular country without the corresponding effect of changing the rules of the political system, it cannot be seen as a regime change (Zanger 2000).

A major distinction of a political regime change has to do with the change in the governing structure of the country which decides who has access or control over power and how such powers are utilized to handle those who do not have political power (Zanger 2000). Who has access to political power can drastically amend the extent to which citizen's interests are treated, how they are governed, and how the larger interests of the populace are taken care off (Lawson 1993; Zanger 2000). Other principles defining political regime are the character of governors, access to power, vertical power limitation, and horizontal power limitation (Skaaning 2006). Political regime change is dependent on three causes such as the extent of economic development and performance, type of regime, and globalization which has a corresponding effect on the stability of a particular regime (Randahl and Vildö 2014). Detailed analysis of the causes of regime change showed and demonstrated that negative economic growth increases the risk of regime change in the ensuing year and also a higher level of GDP per capita has a constraining impact on the risk of regime change in countries (Randahl and Vildö 2014). According to Randahl and Vildö (2014), countries or states that have fairly young regimes/democracies are more prone to have a regime

change as compared to countries with long years or tradition of democratic governance system that experience no risk of regime change.

### Economic Performance/Development and Regime Change

The nature of economic development within a country has an impact on the democratic or regime performance, and studies have demonstrated the link between economic development and performance on the regimes that exist in countries (Acemoglu and Robinson 2005; Bernhard et al. 2001; Diamond 2008; Przeworski et al. 2000). Countries that are developed economically tend to be more democratic due to two underlying reasons. The first is that when countries are more economically developed, the complexity of the social structures in such countries surges deepening the interaction between political institutions and labor which makes it hard for it to be controlled under an authoritarian regime (Przeworski et al. 2000; Randahl and Vildö 2014). Secondly, the survival of democratic regimes can be sustained for long periods in an environment which is highly developed economically (Przeworski et al. 2000; Randahl and Vildö 2014).

### Kinds of Regimes and Regime Change

Regime change can also be influenced by the kind of regime, the institutions, and how long such regimes have been placed (Randahl and Vildö 2014). Monarchy, military, no-party, one-party, and limited multiparty regimes are identified as some of the main kinds of authoritarian regimes (Hadenius and Teorell 2007). Monarchies are considered regimes in which a person of royal descent inherits the position of Head of State in accordance with accepted practices or by the constitution of in place at the time (Hadenius and Teorell 2007). On the other hand, military regimes are in states in which military officers are the main political actors through their perceived or actual force, and the military leadership exercises political power either directly or indirectly through civilian leadership such as civil service and other government institutions (Hadenius and Teorell 2007). This should be distinguished from situations where people with a military background are elected at the polls in open elections to lead organized by nonmilitary institutions which cannot be termed as military regimes (Hadenius and Teorell 2007). Under the one-party regime, only one political party is legally recognized, and all other parties are not permitted to contest or hold themselves in readiness of any elections. Two typical examples of such regimes are the People's Republic of China and the Democratic Republic of North Korea. Lastly, the limited multiparty regimes tend to conduct parliamentary or presidential elections, and some political parties or leaders are made to take part.

### Globalization and Regime Change

Globalization is considered as the expansion of economic transactions and the organization of economic activities across political boundaries countries (Nayyar 2015). It also has to do with a country's deliberate attempts to open up its economy, foster economic interdependence, and cultivate deeper economic integration in the world/international community (Nayyar 2015). Globalization has also brought about the rapid spreading of political democracy around the globe particularly in developing countries and economics in transition (Nayyar 2015). Globalization has emerged as one of the major causes of regime change depending on the extent to which countries are exposed to the outside world. Factors such as international trade, financial integration, and political integration have been identified as the forms of globalization which has the potential to affect the sustainability and stability of regimes (Acemoglu and Robinson 2005). International trade has the ability to influence regime stability particularly in poorer and emerging democracies, and this influence can be in the form of increased wages of the poor in order to decrease the income gap between the poor and rich (Randahl and Vildö 2014). Closing the gap between the poor and rich will positively result in reduced conflict between these income groups there be creating increased political stability (Acemoglu and Robinson 2005).

In addition, the increased financial integration as a result of globalization can bring about capital

**Regime Changes and Public Administration in Ghana, Fig. 1** Map of Ghana

inflows which also close the gap between the haves and have not. Globalization also creates and opens brighter opportunities for the wider population in terms of job creation, etc. (Randahl and Vildö 2014). The political integration which occurs as a result of countries engagement in the international community can provide stability for democratic regimes because countries can suffer tougher sanctions when a legitimate democratic regime is toppled and hence this fear of tougher sanctions can reduce the risk of regime change (Acemoglu and Robinson 2005; Randahl and Vildö 2014).

## About the Republic of Ghana

Ghana is the first country in Africa South of the Sahara to have obtained independence on 6 March 1957 from the Colonial masters. Ghana is located on the West Africa Gulf of Guinea and is bordered on the North by Burkina Faso, on the West by Cote d'Ivoire, and on the East by Togo. It has a land area size of 238,538 sq. km. Accra is the capital city of Ghana. As of 2016, the Ghana Statistical Service projected that the population of Ghana is about 28 million (Service 2016). The map of Ghana is illustrated in Fig. 1.

Some of the major indicators about Ghana are displayed in Table 1.

**Regime Changes and Public Administration in Ghana, Table 1** Development indicators of Ghana

| Indicator | Value | Year/source |
|---|---|---|
| Population | 24,658,823 | 2010 (census) |
| Population under 18 | 11,026,524 | 2010 (census) |
| Youth unemployment | 12.86% | 2010 (census) |
| Life expectancy | 62 years | 2015 (UNICEF) |
| Adult literacy rate | 71% | 2015 (UNICEF) |

## Types of Regime Changes in Ghana

Ghana has undergone a number of regime changes from the time of pre-independence and post-independence eras. The pre-independence was under the British Government who ruled the then Gold Coast through a system known as the indirect rule. It is a system of governance where the people are ruled through local chiefs.

A constitution was promulgated in 1951 to make way for an enlarged legislature comprised of members elected by popular vote either directly or indirectly. Later on 29 April 1954, a new constitution was formulated which established a cabinet that made up of African ministers from an all-African legislature by direct election. This then gave way for elections to be conducted and the Convention People's Party (CPP) which had Kwame Nkrumah as its leader, won the majority of the seats in the new Legislative Assembly. In May 1956, the Prime Minister, Kwame Nkrumah, issued a white paper which proposed independence for Gold Coast. The British Government indicated that it will agree to the proposal for independence only after general elections were held and a reasonable majority was obtained. The elections held in 1956 saw the CPP returned to power winning 71 of the 104 seats in the Legislative Assembly. Ghana then became an independent country on March 6 after the United Kingdom renounced its control over the colony of the Gold Coast and Ashanti, the Northern Territories Protectorate, and the British Togoland.

## Postindependence Regimes

The postindependence of Ghana was characteristic of both democratic/civilian and military rule. These events are chronologically explained in the following paragraphs.

Dr. Kwame Nkrumah who served as the Prime Minister of Ghana from 1957 to 1960 became the First President of Ghana in 1960 after the country became a Republic in July 1960. Ghana experienced the first coup in 24 February 1966, after the government of Dr. Nkrumah was overthrown by Major General Joseph Arthur Ankrah. The new military government regime led by General Ankrah was known as the National Liberation Council (NLC). The military regime declared that the aim of the coup was to end endemic corruption and change the constitution to get Ghana back to a democratic rule. The NLC was a provisional government, and in 1969 elections were organized, and a new civilian government was formed. Brigadier Akwasi Afrifa became the Head of State. He later organized elections and handed over power to Kofi Abrefa Busia. Edward Akufo-Addo became a ceremonial President of the Second Republic from August 1970 to January 1972 until he was overthrown in a coup d'etat.

Colonel Ignatius Kutu Acheampong was the Chairman of the National Redemption Council who took over from 1972 to October 1975 and from 1975 to July 1979. Colonel Ignatius Kutu Acheampong was overthrown by his second-in-command Lt. Gen. Fred Akuffo who was the Chairman of the Supreme Military Council from July 1978 to 1979. Fred Akuffo was later overthrown in a coup d'etat by Flight Lieutenant Jerry Rawlings on 4 June 1979. He initiated measures to bring back constitutional rule, and he supervised general elections which was won by Dr. Hilla Limann in September 1979. Jerry Rawlings then handed over power to the Dr. Hilla Limann government.

Dr. Hilla Limann was elected as the President of Ghana (Third Republic) in September 1979. His regime was short-lived as he was deposed in another coup by the Chairman of the Provisional National Defense Council (PNDC), Lt Jerry John Rawlings, in December 1981. This brought the Third Republic to an end. Lt. Jerry John Rawlings then established the Provisional National Defense Council (PNDC) of which he was the Chairman and the Head of State of Ghana. He later initiated processes to bring back the country to constitutional rule due to mounting pressure from civil society within and outside the country. Rawlings transformed the PNDC into the National Democratic Congress (NDC) which later contested for the 1992 general elections and won by a large margin. He then became the First President of the Fourth Republic. He was reelected again in 1996. He could not contest the 2000 elections due to the constitutional restrictions for a two-term limit. His then Vice President, late John Evans Fiifi Atta Mills, stood on the tickets of the NDC but lost to the opposition candidate John Agyekum Kufuor of the New Patriotic Party (NPP).

John Agyekum Kufuor became the Second President of the Fourth Republic in Ghana after he won the second round of the general elections in 2000 against Prof. Mills of the NDC. President Kufuor's regime lasted for years (two terms). He was not constitutionally permitted to stand for reelection, so Nana Addo Dankwa Akufo-Addo was elected as the NPP's candidate but lost to the opposition leader of the NDC, Prof. Mills, who took over as President on 7 January 2009. After the 8-year tenure of the President Kufuor, Prof. John Evans Atta Mills became the Third President of the Fourth Republic when he won the general elections and was sworn into office on 7 January 2009. Prof. Mills, however, could not complete his full second term in office due to his unfortunate demise which occurred on 24 July 2012. His death paved for the then Vice President John Dramani Mahama to be sworn in as President to finish the second term of Prof. Mills. John Dramani Mahama was then elected by his party the NDC to contest the 2012 general elections of which he won against the opposition candidate Nana Addo. He then became the Fourth President under the Fourth Republic. He later went on to seek a second term but lost to the opposition candidate Nana Addo in the 2016 general elections. This ushered in Nana Addo who became the Fifth President of the Fourth Republican Constitution of Ghana. He was sworn into office on 7 January 2017, as the President of Ghana. His term will expire in 2020 but is legible for another 4-year term as stipulated in the Constitution of Ghana. The postindependence regimes elaborated above are displayed in Table 2.

## Public Administration in Ghana

The nature of public administration in terms of its legal framework in Ghana has its origin in the 1992 Constitution under the Fourth Republic of Ghana. Specifically, Article 11 of the 1992 Constitution outlines the structure and sources of laws that regulate public administration in Ghana. This includes any enactments made by or under the authority of parliament and any order rules and regulations made by any person or authority under a power conferred by this Constitution. It also includes subsidiary legislation such as constitutional instruments, legislative instruments, executive instruments, instruments of a judicial character, bylaws, notices and statues, existing law, and common law.

Article 190(1) of 1992 of the Constitution stipulates the kinds of public services in Ghana. This structure serves as a system through which the government of Ghana's public administration provides public services and good to meet the aspirations of the citizens and the general public. These include:

I. The Civil Service
II. The Judicial Service
III. The Audit Service
IV. The Education Service
V. The Parliamentary Service
VI. The Health Service
VII. The Statistical Service
VIII. The National Fire Service
IX. The Customs, Excise, and Preventive service
X. The Internal Revenue Service
XI. The Police Service
XII. The Immigration Service
XIII. The Legal Service
XIV. Public Corporations
XV. Public Services established by the Constitution and Parliament

The public administration system defined by the 1992 Constitution stipulates that a President is elected for a maximum of two terms in office (4 years per term) and a national parliament/legislature which also has a 4-year term. It also outlines a functioning local government system in which assembly members are elected in all the 10 years of Ghana and ten Regional Coordination Councils to represent the interest of the central government in the respective regions. It also guarantees an independent judiciary, a professional and impartial civil service, the media commission which ensures the freedom of the press is not

infringed upon, and a Commission on Human Rights and Administrative Justice which has the responsibility to protect citizens from injustices or abuse.

## The President

The President is the Head of the Executive branch of Government. The Executive branch of Government is responsible for ensuring the functioning of the public administration systems/services in Ghana. Its ultimate responsibility is to implement the laws passed by the Parliament of Ghana. The members of the executive are largely drawn from parliament (the majority party in parliament). The President is also constitutionally mandated to be the Head of State and Head of Government and the Commander in Chief of the Ghana Armed Forces. The President is mandated to appoint persons to key public officers such as the Chief Justice, the Inspector–General of Police, and the Auditor General. The President makes these appointments in consultation with the Council of State and subsequent approval by parliament. The next person in the hierarchy at the Presidency is the Vice President who is performing presidential functions on behalf of the President if the

President is out of the country, dies, or removed from office as stipulated in the Constitution of Ghana. In the absence of the Vice President and the President, the speaker of parliament is required to assume office.

The Constitution also mandates the President to work with the cabinet. The cabinet is the body which is responsible for assisting the President in the implementation of public policy and government programs. The cabinet is made up of the President, the Vice President, and about 19 ministers of state. The ministers of state are appointed by the President with the approval of parliament to be in charge of a particular ministry such as health, defense, local government, education, etc. In addition to the sector ministers, the President also appoints the Regional Ministers with the approval of parliament. The Regional Ministers are mandated to represent the President in the respective regions, and they are in charged to coordinate and direct the administration and implementation of government policy in the regions. The Regional Minister also chairs the Regional Coordinating Council which is made up of the Regional Minister, his deputies, the President members and the District Chief Executives from districts in the region, two chiefs from the regional house of chiefs, and the regional heads of the ministries.

## Parliament (Legislature)

As stipulated in the 1992 Constitution of Ghana, parliament is the legislative organ of Ghana which is reasonable for passing laws. Law-making is the ultimate function of parliament which is done through debates, passing bills which are assented to by the President before it becomes a law. Parliament is headed by the speaker who is in charge of all the proceedings of parliament by making sure that parliamentary protocol and procedure are duly followed.

The members of parliament conduct their businesses through the chamber of parliament and several committees with the responsibility to scrutinize different bills, policy, and important public interest issues. In parliament, there are three main committees. These are the standing committees, select committees, and ad hoc committees. The standing committees handle issues that are very important to the house. Select committees have the responsibility to scrutinize the expenditure, the management, and policies of ministries, government departments, and other public agencies. The select committees are mandated by the standing orders of parliament to oversee particular ministries and government agencies such as the Ministry of Health, Ministry of Local Government, Ministry of Foreign Affairs, Ministry of Education, etc. Ad hoc committees are meant to investigate issues of high public interest or matters that do not come under any of the select committees.

## Judiciary

The judiciary is the organ of state which is mandated under the 1992 Constitution of Ghana to interpret the laws of Ghana. The judiciary is considered impartial and expected to be independent and subject *only* to the Constitution of Ghana. The judiciary is headed by the Chief Justice who is responsible for its administration and supervision. The Chief Justice is appointed by the President of the Republic in consultation with the Council of State and subsequent approval by Parliament of Ghana. The Chief Justice chairs the Judicial Council. The Judiciary Council is responsible for the administration of justice as stipulated under the 1992 Constitution of Ghana. The Council is expected to work independently in the interpretation of the constitution. Its functions include proposing of government judicial reforms to improve the level of administration of justice and efficiency in the delivery of justice. It also appoints and removes judges as well as other persons of the Judicial Service. The judiciary has two categories of courts: the Superior Court and the Lower Courts. The Superior Courts are made up of the Supreme Court, the Appeal Court, the High Court, and the Regional Tribunals. The Supreme Court is the highest court in Ghana. It has exclusive

jurisdiction over constitutional matters and has supervisory jurisdiction over all the courts in Ghana.

## Conclusion

Regime changes are obvious as a result of discontent with the state of affairs existing within a particular regime which may be underpinned by political, economic, and globalization factors. The effect of regime change does not only affect the regime that existed at the time but importantly the public administration systems of the entire country. Regime change whether democratic/legitimate or undemocratic or illegitimate curtails the smooth administration of public state institutions meant to provide sustainable public administration system for effective public governance. Ghana as a democratic state has gone through several phases of regime change both military and democratic regimes. These regimes (military and democratic) were all instrumental in shaping the public administration systems in Ghana positively and negatively. In addition, regime change affects the implementation of public policy programs of governments, and so, for instance, in Ghana, political parties will choose to implement short-term programs or policies which will earn them votes in the short term instead of focusing durable and sustainable policies which will have a long-term effect. One other aspect of regime change effect on the public administration system is that heads of civil and local government agencies have unsecured tenure of office, and so when the regime changes, then their job goes with the regime as well. This practice has negative effects in identifying and sustaining well-performing heads or manager of the public sector that can implement and deliver good public policy in areas like the education, health, job creation, agriculture, economy, etc. This insecure tenure of office as result of regime change through democratic elections in Ghana is one of the major factors hampering the smooth operation of public administration in Ghana to effectively deliver good public policies which have a long-term impact on the general population.

# Regional Climate Governance

Michelle Scobie
Institute of International Relations and Sir Arthur Lewis Institute for Social and Economic Studies, The University of the West Indies, St. Augustine, Trinidad and Tobago

## Synonyms/Related Terms

Climate governance; Regional governance; SIDS

## Definition

Regional climate governance is the purposeful steering of human activity by states and non-state actors within a geographically delimited area to reduce carbon emissions (mitigation) and to manage the impacts of climate change (adaptation).

## Introduction

Environmental governance is the purposeful steering of human activity by states and/or non-state actors in ways that positively or negatively, immediately or progressively, impact upon the natural and built environments at global, regional, or local scales. Regional environmental governance regimes are formal or unstructured governance arrangements that emerge when adjoining or neighboring states and/or non-state actors within these states coordinate political action and policy making on environmental targets and outcomes over shared or contiguous geographic spaces. In terms of providence, most arise from a concern for natural resources or the environment: need to manage, protect, or preserve a shared resource. Other emerge from regional economic integration movements that include environmental policy or climate change in their remit because of the relationship between the production of goods and services and emissions, climate change, and thus adaptation and mitigation. Geographically these regimes generally develop around a particular transboundary geographical structure such as a regional sea, river basin, mountain range, or forest. Thematically, regional governance may focus on specific natural resources common to the region (migratory species), on common problems (e.g., climate change), and on common socioeconomic objectives (e.g., tourism promotion and pollution control).

Climate change governance is perhaps one of the most complex areas of environmental governance, and new global and regional targets, actors (Blaxekjaer and Nielsen 2015), mechanisms, and institutions contribute to fragmentation (Biermann and Pattberg 2008) across issue areas and spatial and jurisdictional divides. Climate governance is crucial for Small Island Developing States (SIDS) – they are among the most vulnerable to climate change impacts and have least resources for risk management and adaptation measures (Lashley and Warner 2015). SIDS suffer the force of regular and extreme climatic events such as hurricanes and cyclones that are exacerbated by climate change. Climate impacts heavily upon their economies (Strobl 2012) especially since their main economic sectors (tourism, fisheries, and agriculture) depend on good climatic conditions (Hassanali 2013; McConney et al. 2015). The IPCC Fifth Assessment Report (Field et al. 2014) and several regional studies document climate change impacts on coasts, marine biophysical systems (Forster et al. 2014), terrestrial systems, water resources (Boger et al. 2014), human settlements, tourism, agriculture, health, sea levels (which affects ground water quality), coastal fisheries, shoreline erosion, and the destruction of coastal properties and infrastructure (Reguero et al. 2015). Climate change is tied to ocean acidification, coral bleaching and drought (which negatively affects biodiversity) (Oxenford and Valles 2016; Buglass et al. 2016; Gomar 2014), and an increase in vector climate-induced diseases such as Zika and dengue (Field et al. 2014). In recent times, climate change has been attributed to extreme drought in Jamaica, flooding in Guyana and Belize in 2010 (most of Guyana's built areas are below sea level), and an increase in

the incidence of dengue and Zika in Trinidad and Tobago.

SIDS' climate policy is mainly focused adaptation. SIDS contribute to less than 1% of global emissions, and mitigation is less of a priority. Adaptation to climate change increases the already complex development challenge facing these states that now have to include adaptation and mitigation into an already long list of under-resourced regional, national, and local government programs and projects (Scobie 2016). Adaptation for SIDS means policies for improved irrigation, water infrastructure, protection of coastal areas and infrastructure from storm surges and sea level rise (Weis et al. 2016), the development of early warning systems, climate resilient housing (Karlsson et al. 2015), health infrastructure, the development of marine parks and marine protected areas, and mangrove and coral restoration (Godoy and de Lacerda 2015) to reduce the negative impacts of climate change and desalination plants for water security especially in heavily tourist-dependent states (Agrawala et al. 2010). In agriculture sector adaptation policy means finding ways to weather intense climate events, to develop pest resistant crops, and to strengthen resilience. For most Caribbean states that are not oil producers, adaptation also means finding low-energy alternatives to costly fossil fuels and reduces the competitiveness of Caribbean exports (Shah et al. 2014; Niles and Lloyd 2014; Scobie 2013).

## Caribbean SIDS Regional Climate Governance

Climate change governance falls within the UN 2016–2030 Sustainable Development Agenda (SDG), in particular Goal 13: **Take urgent action to combat climate change and its impacts** that includes a target to, "Promote mechanisms for raising capacity for effective climate change-related planning and management in least developed countries and small island developing States, including focusing on women, youth and local and marginalized communities." The challenge with the organizations and departments at the level of each SIDS is how to use the limited resources for environmental policy and governance to manage climate change impacts.

## Regional Climate Governance: Thematic Division

Thematically, climate governance falls within the remit of several regional agencies that work with national level state departments and NGOs on projects and programs.

### Disaster Risk Reduction and Adaptation to Climate Change

Caribbean states engage in disaster risk management with support from the Caribbean Development Bank, the Caribbean Disaster Emergency Management Agency, the Caribbean Community Climate Change Centre, the Caribbean Hurricane Network, the Caribbean Institute of Meteorology and Hydrology, the Caribbean Policy Development Centre (a hub of NGOs), the regional offices of the International Federation of the Red Cross and Red Crescent Societies (IFRCS), and the Association of Caribbean States.

### Marine Governance, Fisheries, and Coastal Zone Management

The Caribbean Environmental Program, on behalf of 33 mainland and island member states and territories, coordinates a network of treaties related to marine governance: The Convention for the Protection and Development of the Marine Environment in the Wider Caribbean Region (WCR) or Cartagena Convention and its protocols for Oil Spills, Land-Based Sources of Pollution (LBS), and Specially Protected Areas and Wildlife for the Wider Caribbean (SPAW Protocol). Caribbean states under Article 4 of SPAW Protocol agree to create protected areas (including marine protected areas) to preserve natural habitats, resources, and ecosystems in the Caribbean region, especially coral reefs that have begun to show signs of bleaching due to climate change.

The Caribbean Regional Fisheries Mechanism established by Caribbean states includes climate change adaptation in its mandate to protect and promote fish and aquatic resources. It partners

with regional and international agencies including the Caribbean Network of Fisherfolk Organizations, the Food and Agriculture Organization of the United Nations, the Fisheries and Aquaculture Organisation of Central America, and the International Commission for the Conservation of Atlantic Tunas.

### Health and Food Security

The Caribbean Public Health Agency coordinates regional efforts related to environmental health, epidemiology, food and nutrition, health research, and laboratory drug testing. Some of its most recent climate change-sustainable development projects have been the promotion of water security (by helping develop safe rainwater harvesting systems), vector control (especially for the recent outbreaks of Zika, dengue, and chikungunya), and environmental audits and the development of adaptation policy for natural resource management in the agriculture, forestry water, and wastewater sectors. Climate change efforts in agriculture are centered on adaptation, with some mitigation projects (developing greenhouse gas inventories especially in Jamaica). Caribbean Community (CARICOM) member states established the Caribbean Agricultural Research and Development Institute (CARDI) that manages the region's agricultural policy. CARDI collaborates on agriculture and climate change initiatives with the Caribbean Community (CARICOM) Secretariat and with other regional and international agencies and NGOs including the Association of the Caribbean States, the Caribbean Agribusiness Association (CABA), the Caribbean Agro-Economic Society (CAES), the Caribbean Development Bank (CDB), the Caribbean Disaster Emergency Response Agency (CDERA), the Caribbean Food Crops Society (CFCS), the Caribbean Food and Nutrition Institute (CFNI), the Caribbean Poultry Association, the Caribbean Research Industrial Institute (CARIRI), the Organisation of Eastern Caribbean States (OECS), the Pan American Health Organization (PAHO), the United Nations Economic Commission for Latin America and the Caribbean (UNECLAC), the United Nations Development Programme (UNDP), and others. In addition to CARDI, the FAO Regional Office for Latin America and the Caribbean, Latin American, and Caribbean Forestry Commission (LACFC), the Commission on Livestock Development for Latin America and the Caribbean (CODEGALAC), the Commission on Inland Fisheries and Aquaculture for Latin America and the Caribbean (COPESCAALC), the Western Central Atlantic Fishery Commission (WECAFC), and the Caribbean Food Crops Society are all active in the regional climate change-agriculture governance.

### Energy Governance and Tourism

The Caribbean Centre for Renewable Energy and Energy Efficiency (CCREEE), established in 2015, is the hub for sustainable energy projects and partners with the CCCCC, the Small Island Developing States Sustainable Energy and Climate Resilience Initiative of SIDSDOCK (a SIDS initiative to pool efforts to connect the energy sectors of the islands to the global market for finance, renewable technologies, and carbon emission trading), the Energy Unit of the Caribbean Community (CARICOM) Secretariat, and the United Nations Industrial Development Organization (UNIDO). The Caribbean Tourism Organization is the region's tourism development agency. In recent times the focus has been on capacity building for energy efficiency in hotels and in disaster risk management. The Association of Caribbean States also has a tourism mandate through the Convention establishing the Sustainable Tourism Zone of the Caribbean (STZC).

### Environment and Biodiversity

Caribbean islands are biodiversity hot spots. There are over 11,000 plant species on the islands, 72% of which are endemic. Climate change, land degradation, urban tourism, overexploitation of resources, predation by invasive alien species, and pollution threaten sustainability. Member states address biodiversity individually often with the help of funding from external agencies including the EU and the Global Environmental Facility and as a region in partnership with CEP/UNEP (http://www.car-spaw-rac.org/?Partners-and-stakeholders-in-the,77) through

activities under the SPAW Protocol. Caribbean SIDS collaborate with the International Union for Conservation of Nature and its World Commission on Protected Areas, the Nature Conservancy (NGO), the Wider Caribbean Sea Turtle Conservation Network, and science-based institutions such as the University of the West Indies, the Centre for Agriculture and Biosciences International, and the Caribbean Invasive Alien Species Network. In coordination with the Convention on Biological Diversity, Caribbean states are involved in the Caribbean Challenge Initiative for the conservation and management of at least 20% of marine and coastal environments.

### Caribbean Community Climate Change Centre

Between 1997 and 2007, CARICOM managed three fixed-duration and donor-funded climate change projects (Caribbean Planning for Adaptation to Climate Change, Adapting to Climate Change in the Caribbean, Mainstreaming Adaptation to Climate Change) that culminated in the establishment of the Caribbean Community Climate Change Centre (CCCCC) in 2004. CCCCC supports regional states by providing climate change data and policy advice. It is the Caribbean focal point for the UNFCCC, UNEP, and other international agencies. The CCCCC helps to source funding for climate change projects and is a Green Climate Fund regional implementing agency.

The regional climate policy is found in four main documents: the *Liliendaal Declaration* (2009) reaffirmed the region's commitment to mitigation and adaptation, the need for financial and technical support to implement climate policy, and the importance of the CCCCC in implementing Caribbean Climate policy; CARICOM's *2015–2019 Strategic Plan for the Caribbean Community: Repositioning CARICOM* (2014), the overarching regional development agenda, proposed a management framework to reform existing governance mechanisms (CARICOM 2014); the *Implementation Plan: Delivering Transformational Change 2011–2021* (CCCCC 2011) follows the targets of the *Regional Framework for Achieving Development Resilient to Climate Change* approved for 2009–2015. The Regional Framework's five priorities for climate change resilience were mainstreaming adaptation strategies into development agendas, using specific measures to address vulnerabilities, promoting the switch to renewables and clean energy to reduce emissions, reducing impacts and vulnerabilities in human and natural systems, and promoting forest management.

## Geopolitical Regional Climate Governance: CARICOM, ACS, and OECS

The Caribbean is served by three overarching regional institutions for functional cooperation and/or economic integration: CARICOM, the ACS, and the OECS that have overlapping members and climate change mandates.

The Association of Caribbean States is the forum that unites the English-speaking Caribbean Islands with neighboring Central and South American states. It comprises member states, associate members, founding observer organizations, observer states, observer organizations, and social partners that support multiple regional climate change initiatives.

CARICOM is one of the oldest economic regional integration institutions and had its genesis in the 1958 British West Indies Federation. The Caribbean Community and Common Market (CARICOM) has since 1973 been the main organ of regional economic integration, functional, technical, and foreign policy cooperation among its 15 member states.

The Organisation of Eastern Caribbean States (OECS) is a subregional economic integration and functional cooperation initiative of the Eastern Caribbean countries (seven member states and three associate members) created in 1981 by the Treaty of Basseterre.

## Assessing Caribbean Climate Governance: Policy Coherence in Caribbean Climate Change Governance

It is surprising that small island states can be expected to engage in such a wide range of regional climate change initiatives. In addition to

the specific climate change vulnerabilities mentioned above, Caribbean states have small populations, large and urgent social and economic development needs, substantial debt in many cases, and limited financial, technical, and human resources. The environment state agencies and departments are generally small (some issue-specific units may have just one or two persons) and lack the human, technical, and financial resources to consistently and effectively engage the fragmented multilayered, multi-scaled, and multi-sectored regional and international climate architecture. To date there is no regional forum that has been successful in coordinating regional and national initiatives to reduce duplication of resources at country level and consolidate efforts. In most cases, good governance is not institutionalized into policy making and implementation, generally because no resources are dedicated toward policy coherence.

Policy integration or coherence applies to three main processes: setting and prioritizing policy goals, coordinating and implementing climate-related policies, and monitoring and reporting on policy action and impacts. Policy coherence requires political will (Chayes and Chayes 2009), builds good governance into climate policy processes (Jordan and Lenschow 2010), and can help Caribbean government departments manage the coordination challenges caused by climate governance fragmentation (Scobie 2016). The main challenges in the region are the difficult task of dividing limited resources between short-term socioeconomic priorities and long-term climate adaptation and mitigation goals, the lack of continuity and sustainability in funding and financing models, and the frequent modifications to national climate programs caused by changing political administrations and political interference in policy making, data deficits, and missing accountability/transparency institutional governance frameworks (Scobie 2016).

## Conclusion

This overview raises four points:

The importance of climate change for many of the sensitive development issues – especially in the areas of marine governance, disaster risk reduction, tourism, and health.

The complexity of the regional climate change governance arrangements.

That regional states are proactive in seeking functional solutions by creating institutions of functional cooperation to address these issues.

Finally that the fragmentation and complexity of institutional arrangements demand substantial resources – human, technical, and financial – to fulfil their mandates.

The model of donor project funding tends to promote pilot programs which hardly provide sustainable solutions – the initiatives do not support continued development of national implementation, economies of scale, nor the best use of resources across the region. Projects that provide frameworks for cross-sectorial collaboration; that build accountability, transparency, and effective involvement of stakeholders into policy making and implementation; and that provide resources for monitoring and analysis for continual development of climate policy are needed to make donor-funded climate change projects more sustainable in the medium to long term (Scobie 2016).

## Regional Economic Development Policies of Korean Central Governments

Gil H. Park
College of Public Affairs, Daegu University, Gyeongsan, South Korea

Until the early 1960s, per capita GDP level of the Republic of Korea (hereafter to be referred to as "Korea" or "South Korea") was extremely low. Its per capita GDP ranked almost the lowest among all the countries that were surveyed by the United Nations (UN) then. As of the year 2017, however, its economy is the 11th largest in the world with a nominal GDP of 1.53 trillion United States

This study addresses past and recent South Korean regional economic development policies, based on author's doctoral dissertation.

(US) dollars, while its population has just doubled, e.g., from about 25 million to 50 million.

This fact of realized economic development from the extreme poverty state would still have significant implications for many developing countries. In particular, it would be very important to examine how Korea has developed the national economy, whose regional economies have been developed with their own original "growth centers" to have recently grown as high-density metropolises in the glocalized era. This chapter introduces how Korea has implemented regional economic development policies with an emphasis of the national comprehensive (territorial) plans in conjunction with the OIG (outward-, industry-, and growth-oriented (Song 1992)) strategies centering on top-down export-led economic development and growth center projects rather than endogenous economic growth developing local indigenous resources. Then it discusses the limitations of those policies outlined with the "growth center" and "unbalanced growth" strategies, reviews the causes of such limitations from the viewpoint of political economy, and concludes with theoretical and policy implications for the present Korean government and other countries.

## Toward Growth: The Growth Center and Unbalanced Growth Strategies

In modern history, during President Park Chung-hee's military regime (1963–1979: coup d'état in 1961), the growth center strategy and the unbalanced growth strategy were adopted and implemented complementarily to each other, after the promise of preparing the Five-Year Economic Development Plans (EDPs), whose second plan explicitly documented the phrase "export first," on the date of coup d'état. It had soon constructed essential industrial infrastructures in the 1960s according to the first (1962–1966: 7.1% as the target GNP growth rate [7.8% actually attained]) and second (1967–1971: 7.0% targeted [9.0% attained]) EDPs, when annually 43.7% (for the first EDP) and 35.2% (for the second EDP) increases in export were recorded and the percent share of export in GNP increased from about 1% to 12%. Then it officially announced eight (e.g., Seoul, Busan, Daegu, Gwangju, Daejeon, Cheongju, and Chuncheon) regional growth centers in the year 1972. Based on such top-down but effective accomplishment and designation, it actively and more systematically implemented the decadal regional development policies named the "national comprehensive (territorial) plans" (NCP). The NCP was implemented in conjunction with its macroeconomic plan for attaining economic growth, EDP, which centered on the industrial strategy called the "Heavy-Chemical Industry" (HCI) drive since 1964, when the regime realized the ineffectiveness of the import substitution strategy to focus on light industries (Oh 2009).

In theory as well in practice, this industrial drive was in accordance with the growth center strategy of the NCP, as the drive itself was based on Hirschman's (1958) unbalanced growth strategy. The unbalanced growth strategy emphasized the spillovers or externalities, called "backward linkage effects" (or "spreads" in terms of Myrdal (1957)). Those effects are typically from HCIs. As for the NCP, which was a spatial planning policy option for national development rather than regional development, it was based on the growth center strategy. Originally, this spatial strategy showed a great commensurability with the Hirschman's (1958) industrial strategy since it also emphasized spillovers or externalities from "the propulsive pole" (or the dominant region) to "the propelled" (or the dominated region) in economic space (also through political space abstractly) (Perroux 1950) or in principal cities system (Bouderville 1966).

In legislation, the detailed plans and strategies for the above growth centers were based on the "Act on Comprehensive Plans for Construction in the National Territory" (ACPCNT) in the year 1963. Until the 1960s, pursuing the comprehensive development policy, the central government enacted it and prepared such essential infrastructures for development as the nation's first expressway (Gyeongbu Highway as Highway Number 1) and harbors or international airports. In addition, Koreans' overall strong aspiration for education as a means of elevating social status by attending

prestigious high schools and universities, which is known indirectly from Coleman (1988), has naturally led to (at least nominal) increases in human capital and social capital (measurable by educational attainment as a proxy) as effective resources for economic growth, too (Park 2009).

With respect to political legitimacy from the beginning of the coup d'état, the 32 military people's Supreme Council for National Reconstruction introduced national development planning, which began to be widely adopted across nations in the Cold War. In the postwar period, Rosenstein-Rodan (1943), Nurkse (1953), Myrdal (1957), and Hirschman (1958) emphasized the government's role in economic development actively made especially in defeated countries and the Third World. In light of the leads and lags in the schedule of enactment or implementation and some contents, it could have seemed similar to postwar Japan's Comprehensive National Development Plan (CNDP), which was implemented in 1962. In fact, this plan, which was revised in 1969 as the New CNDP (NCNDP), was about 10 years ahead of Korea's. However, there was some critical misunderstanding or at least intentional revision of the original growth center strategy and the unbalanced growth strategy in Korea. Consequently, it has led to a quite different, "growth-oriented" road of development taken by Korea.

## The Growth Orient of the Unified Strategies

In postwar Japan, both plans, CNDP (1962) and NCNDP (1969), were commonly based on the Comprehensive National Land Development Act, which is enacted in 1950. About 10 years later, Korea also enacted and implemented seemingly similar but its own tailored version, NCP. The two countries' strategies could have seemed similar at first glance.

However, Korea's NCP was different to Japan's (N)CNDP or France's original growth center strategy to overcome many problems represented by J.-F. Gravier's critical text, "Paris and the French Desert." It is especially because the growth center strategy in Korea tended to be adopted as a spatial planning policy of infrastructure construction to attain targeted economic growth levels (e.g., exports of 1,000,000 dollars until 1980) rather than to facilitate the "balanced regional development" (BRD) of each growth center. Actually, the NCP was implemented by the Ministry of Construction to assist the goal-achieving process for economic growth together with EDPs.

Meanwhile, the original growth center strategy had been formulated for reducing the interregional disparities or imbalance between Paris and the French Desert. Eight "compensatory metropolises" were designated as growth centers across the three "homogenous regions" (Paris, East, and West) in French spatial planning. As emphasized in the expression, "compensatory," Bouderville's (1966) original goal of the spatial application of Perroux's (1950) growth pole theory stressed the "balance and compensation" between regions, which might be discussible with the regional economic interpretation of the Hicks-Kaldor compensation principle (for the primate region benefited from the acceleration of agglomeration economies as politically facilitated "externalities" to compensate other local regions). In Japan, CNDP and NCNDP also aimed at balancing regional development across the country, especially between Tokyo and others.

In Korea, the explicitly documented main goals of the first NCP (1972–1981), e.g., the "efficient use and management of land, "construction of social overhead capital (SOC)," "exploiting resources and natural conservation," and "making livable environments," implied that the economic reasons to rationalize and realize macroeconomic growth were prioritized in order to tackle with (extreme) poverty. Efficient allocation and infrastructure construction were intended to be incorporated with natural conservation and livable environments, but these two aims were intrinsically hard to be realized at the same time, especially when the HCI drive was made.

In fact, thus, NCP's detailed strategies and programs could not help but be growth-oriented for the Park Chung-hee administration, which lacked sufficient political legitimacy and tried to

compensate it by poverty elimination and economic growth. In such trial, they were formulated, enacted, and implemented "geographically," in accordance with the "growth-oriented" economic development planning, which was represented by the Economic Planning Board (EDP). The EDP was formulated and implemented in 1962 by the EPB, which had already been established in July 1961, whose top-down policy orientation had changed from import substitution to export-led industrialization since 1964, after it realized that essential infrastructures and capital were too limited and insufficient until 1963. In policy making, such economists as Deokwoo Nam, Seung-Yun Lee, and Manje Kim (at Sogang University) and bureaucrats or technocrats including Chung-Hoon Park, Hak-Ryul Kim, Yong-Hwan Kim, Woncheol Oh, In-Young Ham, Hyung-Seob Choi, and Ki-Hyung Kim agreed with the HCI drive around the early 1970s, when economic growth based on "labor-intensive and export-led" industries had already succeeded in the "developmental state" (Kim 1997) since 1964.

In terms of political science, it can be understood that, under the slogan, "Growth First, Its Distribution Later," the Park Chung-hee military regime tried to find the political legitimacy by eliminating the nation's poverty and enhancing its military power especially against neighborhood communist countries during the Cold War. The US bureaucrat and scholar having worked in and researched Korea since 1945, MacDonald (1996: 54) remembered, "Despite the unconstitutionality of the action, people accepted it – not with enthusiasm, but something like relief. . . . Despite initial mistakes, the military administration moved to revitalize the economy. They co-opted trained civilian economists and administrators and placed military officers in civil government positions both to improve operations and to reward supporters. Reluctantly at first, but then on a businesslike basis, the US authorities worked with the military government to stabilize the economy and then to help finance the First Five-Year Plan for development (1962–1966)."

In terms of resource allocation, resources for those two growth-oriented strategies, which commonly emphasized spillovers from strategically chosen industries or regions, were practically concentrated into two primate growth centers, the Seoul-Incheon and Busan-Southeast (SBS) coastal conurbations before the mid-1970s. All the other cities (to have grown as metropolises later) then were also the "loci," where the light industry (in the 1960s) and HCI (from the 1970s through 1990s) drives were implemented geographically, but their economic growth rates overall lagged behind the two primate conurbations. For building the necessary infrastructures and large facilities or factories suitable for each locality's geographic and market characteristics, other "local" locations were strategically chosen as the sphere or space where industrial externalities were strategically concentrated and then spilt over, as well.

However, a lot of those spillovers still tended to be concentrated into the two primate conurbations until the mid-1970s through many initial development projects in the SBS conurbations (as summarized from Tables 4, 5, 6, and 7). Despite lots of projects for this apparent large-scale investment and infrastructure construction were strategically made in the SBS conurbations, the Korean central government even began to actively implement growth management policies like urban containment measures and soon expanded to the smaller cities (Kim et al. 2003). Their implementation was also made even without considering the difference in the growth rate and phase of the growth centers as agglomeration economies.

If the central government then had carefully considered the macroeconomic and urban growth processes, where the SBS coastal conurbations and others had experienced different rates of economic growth, the greenbelts might have been implemented more intensively in SBS conurbations. These primate conurbations had already grown calling for restrained urban sprawl and pollution. Their growth had still been much ahead of the other growth centers with the lower rates of economic growth as well as urban sprawl and pollution. Through the "top-down" approach to the implementation of the greenbelt, however, a smaller part of the greenbelts around the growth centers was also designated in 1971 for the first

time in the SBS coastal conurbations and soon expanded to all the growth centers (e.g., reaching the size of 5,397 $m^2$ as 5.4% of the national land) and even to smaller local cities year by year until 1977.

Despite the intended goal of "managing urban sprawl and conserving environments," the greenbelted areas in Korea experienced some side effects, which also worked toward the direction of enhancing the growth of SBS conurbations. In particular, the "efficient" land use within the contained areas designated during the modern world's fastest national macroeconomic growth period (e.g., a decade of 10% economic growth rates) naturally led to soared land and house prices and more populous growth especially in the Seoul metropolitan area (SMA). Meanwhile, the original purpose in the early twentieth century and nominal purpose in Korea was primarily to conserve open and suburban agricultural spaces rather than restraining or managing urban growth (Bengston and Youn 2006). Accordingly, due to the "top-down and undifferentiated" implementation of the greenbelt, disposable income (after housing costs) in the primate (SBS) coastal conurbations decreased but were still much higher than in other local areas despite the limited land use and soared house prices that were still too insufficient to restrain further migration from outside the two primate conurbations.

This implies that, without such full-scale and undifferentiated nationwide implementation of the greenbelts, which were designated and regulated across the country according to the top-down policy prescription to control urban sprawl and conserve environments rather than an objective analysis of different urban economic growth and rural-to-urban migration rates with respect to real wages or disposable income during the rapid economic growth period, more BRD could have been possible. Remember that BRD was the original goal of the growth center strategy itself. Agglomeration economies are often essential for rapid economic growth, but larger (groups of) factories and people do not necessarily mean "sustained" higher rates of economic growth, although environmental values are socially very important as well. The problem lied in the top-down criterion and nationwide designation of the large-scale greenbelts without objective analysis or evaluation to prioritize in consideration of economic growth and (balanced) regional development as well as the sufficient consensus of local governments and native residents. In discerning the policy priorities between economic growth and BRD, the phases of backwash and spread had to be considered through the objective analysis of income, population, employment, and tax base growth.

Figure 1a shows each representative region's (or province's) percent share of GRDP from 1968 to 2010. Until 1976, when exports of one million dollar were achieved by the export-led industrial policy, the SBS conurbations had increased or sustained its share. The SMA had recorded the largest increase in GRDP, while SEA had sustained its share. The SEA, meanwhile, recorded the largest decrease in GRDP (in terms of the growth rate) from 1968 to 1995, before the reestablishment of local autonomous government. After this reestablishment, Korea soon became an Organisation for Economic Co-operation and Development (OECD) country, and its annual growth rate was stabilized between 2 and 3%. After the year 2000, both population and GRDP percent shares in the SMA and others also have almost come closer and have recently become 50–50, which suggests an economic equilibrium (of labor) between regions. However, it is still questionable if this kind of stabilization is desirable for the strategically developed economies agglomerated within the 11.8% of the total national land and for others.

Meanwhile, the regional distribution of per capita income tax as the indicator of living and local finance standards suggests the enlarged gap between the SMA and others presently (and between the SBS and others in the past). Figure 1b shows per capita income tax by region in Korea from 1996 to 2007, e.g., from the beginning of local autonomous government (interrupted in the coup d'état in 1961) through the end of the Rho Moo-hyun administration (2003–2007), whose top policy agenda was

**Regional Economic Development Policies of Korean Central Governments, Fig. 1** GRDP Share (%) and Regional Per Capita Income Tax (Metro. Mean = 100). (**a**) The Percent Share of GRDP from the Year of 1968 to the Year of 2010. (Source: Kim 2012). (**b**) Relative Per Capita Income Tax from the Year of 1996 to the Year of 2007. Note: The national mean of the metropolitan-level data for each year was normalized as 100 and then 16 metropolitan areas' respective values were summed into the above five representative regions (or provinces) for each year. By summing 16 metropolitan-level data (whose mean is 100 for every year) into each representative region, it is indictable how much (representative) provincial-level per capita income tax is aggregated, so that provinces' relative amount of per capita income tax may be compared. SMA (Seoul Metropolitan Area as Seoul, Incheon, Gyeonggi), SEA (Southeast Area as Busan, Daegu, Ulsan, Gyeongnam, and Gyeongbuk), SWA (Southwest Area as Gwangju, Jeonnam, and Jeonbuk), MID (Mid-Nation Area as Daejeon, Chungnam, and Chungbuk). The income tax is attributed to the residential address of the worker. (Source: Kim et al. 2003; National Tax Statistics 2019)

"balanced national development," i.e., national-level implementation of BRD. Keeping the election promise, the Rho administration tried to make the New Administrative Capital around the mid-region in South Korea and realized Sejong City as the (multifunctional) administrative city after continued national debate and consensus. Together with it, the Rho administration enacted and implemented "Special Act on Balanced National Development" (2003) in order to facilitate balanced regional development across the nation and began to construct Innovation Cities and Enterprise Cities in every local metropolitan area.

However, despite the Rho administration's implementation of nationwide BRD as the top priority, the regional distribution of per capita income tax as a realistic indicator of living and local finance standards in Fig.1b shows per capita income, and its taxes have increasingly or sustainably been "attributed" to SBS, until the year 2000, and to the SMA only, after the new millennium. The mid-nation area seems to have experienced an increase possibly because of its location as an outer hinterland region to the SMA and of the continued announcement and real start to implement the construction of Sejong City. Meanwhile, other local areas, even including the SEA, experienced a continual decrease after 2000.

## Top-Down Development Projects for Economic Growth

Theoretically, national development planning targeted boosting the national economy through "complementary investments" between industries (Nurkse 1953) in the case of the "balanced growth strategy" and through "strategic investments" in propulsive industries with greater backward effects (Hirschman 1958) in the case of the "unbalanced growth strategy." Despite the difference in strategic efforts to enlarge the national economy, these two theories shared a view that, by government intervention, an inter-industry demand could be effectively expanded with the further expansion of the market. This strategy needs not to be confused with that which Hirschman (1958) advocated through his perspective on "unbalanced growth." On the contrary Hirschman emphasized that regional disparities should be abridged although "unbalanced growth strategy" needs to be employed temporarily. Alonso (1968) and Hansen (1981) also supported Hirschman's (1958) anti-disparity policy orientation through unbalanced growth strategy. Hirschman (1958) stressed the role of government in minimizing disparities if the concentrated development outcomes are not decentralized in the later stage of disequilibrium development.

In practice, however, strategic investments were made in favor of HCIs, which called for large-scale capital formation or natural monopoly to lead to the concentration of localization (at the initial stage) and urbanization economies (at later stages) in SBS areas, as expounded in Tables 1, 2, 3, 4, 5, 6, and 7. As a result, those agglomeration economies accelerated further labor and capital inflow especially into the growth center region, where such strategic investments were intended for maximizing the unbalanced growth of the HCI industries and their strategic locations. However, the designation of growth centers and the strategic industrial investment were made in favor of SBS especially along the Gyeongbu Expressway (National Highway Number 1). Literally, Gyeongbu means Seoul and Busan. Considering logistics, the development of metropolises with strategic industries along the Gyeongbu Expressway might have been inevitable.

At the same time, however, considering the original distribution of population, industries, and (the volume of shipments through) harbors, which had originally been larger than in total, it is still questionable to economically rationalize opportunity costs for non-Gyeongbu Expressway areas if strategic investment along the Gyeongbu Expressway (from the northwest to southeast of South Korea in the Korean Peninsula) was against neighborhood communist countries during the Cold War in the following development contexts (Table 1). Even if it was a military strategy, which might be urgently implemented without public consensus regardless of the free market at times, the government might have needed to compensate it or make people understand for past resource

**Regional Economic Development Policies of Korean Central Governments, Table 1** A chronology of Korean economic and regional development contexts

| Year | Development contexts |
|---|---|
| –1910 | Society based on Confucius feudalism with limited direct doors to western modernity; the rule of the late Chosun Dynasty called "the Hermit Kingdom" (1636–1876), being confronted with increasing Western and modernized Japan's pressure to open diplomatic and economic doors, let alone doors to China |
| 1910–1945 | Japanese occupation period; the piecemeal introduction and acceptance of western culture, philosophy, technology, and ideology |
| 1945 | Liberation from Japanese occupation and totalitarianism |
| 1945–1950 | Hyperinflation and political turmoil of ideology |
| 1950–1953 | The Korean War |
| –1961 | National poverty (GNP per capita less than US$ 100 before 1963); the implementation of land-to-the-tiller agrarian reform by Rhee Syngman's administration; 4•19 Democratic Revolution (1961) |
| 1961–1979 | Park Chung-hee's coup d'état (1961) and implementation of **Five-Year Economic Development Plans** (1962–) and **National Comprehensive Territorial Plans** (1972–) under Cold War ideology<br>The rise of Chaebol regimes with governmentally fostered export-oriented industries, labor-intensive industries, capital-intensive industries, and heavy and chemical industries<br>Construction of the Gyeongbu (Seoul-Busan) Expressway (1968–1973)<br>Dispatching the Korean army and marine corps to the Vietnam War (1965–1975)<br>The assassination of Park Chung-hee (1979)<br>Persistent unbalanced regional growth<br>Inexperience in local autonomous government and political immaturity |
| 1979–1987 | Chun Doo-hwan's coup d'état (1979) and the attainment of highest annual economic growth rates next to ones in Park Chung-hee's administration; 5•18 Gwangju Democratic Revolution (1980) |
| 1988 | Seoul Olympics |
| 1993 | Reestablishing the reign of the civil government |
| 1995 | Beginning of the local autonomous government |
| 1997 | The Asian financial crisis and aid from the International Monetary Fund |
| 2002 | The Korea-Japan World Cup |
| 2007 | The attainment of GNI per capita over US$ 20,000 (population: about 4.8 million) |

Notes: For the 10-year NCP, an open circle denotes the emphasis on either efficiency or equity

reallocation after the goal attainment of such a strategic policy. From the perspective of the market, it is still explicitly a critical government intervention, so that there should be a scientific evidence that the strategic agglomeration economies in the primate growth centers have engendered more national product than the case without such strategic investment and policy leading to the

concentration of agglomeration economies. Even if Korea's economic growth was much higher than the world average, the growth itself could not have been simply rationalized in terms of the Pareto efficiency, which implies present national product surpasses the past one after resource reallocation. When including the opportunity cost of the resource reallocation in the Cold War, people should have been considered to have sufficient rationality to calculate such a cost if the free market logic applied, or at least the government should have sufficient "economic and military" evidences to make people understand at least ex post for such strategic investment that had been rationalized for economic and military perspectives.

Interregional disparities have been rarely abridged in South Korea although national development planning (e.g., NCP and EDP), which considered equity at least ostensibly, was implemented. In particular the disparities between two primate growth-pole regions (e.g., Seoul and Busan) and others or the disparities in the southeast (Gyeongnam and Gyeongbuk) and southwest (Jeongnam and Jeonbuk) continued to be problematic since the Park Chung-hee military regime (1963–1979) implemented growth-pole and unbalanced growth strategies in the early 1970s. The two other leaders of the next military regimes (1981–1987 and 1988–1992) were also from the southeast, and more than 40% of the elites serving in public positions were from the southeast. Although the policy orientation of the NCP was interregional equity as well as efficiency (Table 2), the development outcomes were concentrated in two primate growth-pole regions, and especially in the SMA. Table 2 below summarizes the policy orientation of the NCP by period.

Table 3 summarizes the policy orientation of the EDPs from 1962 to 1996. The 5-year national economic development planning was terminated at 1996 because South Korea achieved a high level of growth and its development plans became more diversified and geared toward the needs of segmented industrial or business sectors in the knowledge economy. The institutions such as the EPB and the Korea Development Institute (KDI) continued to make, propose, and evaluate the Korean economic development policies with the economic ministries. (Economic ministries' name has been changed when the administration changed.)

Tables 4, 5, 6, and 7 summarize major development projects in the 1960s, 1970s, 1980s, and 1990s, respectively. It is consistent with the literature's evaluation that the development projects were focused on laying the groundwork for two primate (growth-pole) regions at the initial state of development (especially in the 1960s) although efforts to balance regional development have been gradually increased (Park 2009; Choi et al. 2007). Considering the fact that the major development

projects in the 1960s created the backbone for further development, it was natural that the strategic blueprint of regional development in South Korea was made by southeast regional elites in government. Their share of high-rank officials in the central government was more than 40% from 1982 to 1997. During the Park military regime (1963–1979), the percent share of southeast elites was lower than the period above since elites who were born in North Korean regions shared 18.3% in high-rank officials. It was also natural that these elites were concerned with their home regions first "in response to" the need of regions.

## Reviewing Recent Approaches to BRD from the Viewpoint of Political Economy

Perroux (1950) theorized the well-defined concepts of two abstract spaces, "economic space" and "political space," emphasizing their interplay in determining the economic interaction and

**Regional Economic Development Policies of Korean Central Governments, Table 6** Major development projects in the 1980s

activity in practice. Abstract space is the hypothetical space of abstract relations which define an object and economic (or political) space is a kind of abstract space that is defined by economic (or political) relations where economic (or political) factors exist. This concept within the original growth-pole theory in the tradition of political economy will be useful to better understand the development of the growth-pole regions or growth centers in modern Korea especially when we understand such economic and political relations as economic networks and social networks through which economic and political resources can be channeled, planned, and (homogeneously) aggregated in the "field of forces" (Perroux 1950).

Table 8 compares the different orientations of two recent governments toward balancing regional development. The Park Geun-hye (the daughter of Park Chung-hee) administration, whose presidency (February 2013–December 2017) was interrupted by the impeachment in March 2017 and succeeded by the Moon Jae-in administration in May 2017 after the snap election, has overall sustained the regional development plans in the Lee administration, except that the efficiency-emphasized terminology of "Economic Regions" (ER) was substituted with "Happy Living Zones," relatively emphasizing their education, culture, and welfare enhancement that were pursued without detailed action plans in still the same zones or belts.

The Rho administration (2003–2007), where the present president Moon Jae-in played the influential role in policy making and implementation as House Chief of Staff, tried to implement

**Regional Economic Development Policies of Korean Central Governments, Table 8** Recent governments' approaches to balancing regional development

| Rho administration (2003–2007) | Lee administration (2008–(2012)) |
|---|---|
| - Ideological and **innovative**<br>- **Regional innovation systems (RIS)**<br>- Equity emphasized in the long run<br>- To diffuse **innovation** among regions<br>• Innovation-oriented development<br>• To foster local regions' self-sufficiency<br>• To pursue the SMA's qualitative change<br>• To develop networked national spatial structure<br>• The win-win strategy between the SMA and other local regions | - Practical and **strategic**<br>- **Economic regions (ER)**<br>- Efficiency emphasized (equity-considered)<br>- To foster **competitiveness** (in **glocalization**)<br>• Competitiveness-oriented development<br>• To maximize growth potential in the ERs<br>• To specialize regional growth engines<br>• To facilitate decentralization and local regions' self-sufficiency in the ERs<br>• Win-win strategies through cooperation and integration between the SMA and others |

Notes: The ER is a spatially reformulated economic zone to cope with "globalization" and "localization" at the same time. Five zones and two special zones, namely, "5 + 2 ERs," were designated. Five zones are (1) The SMA (northwest), (2) Chungchung (mid-nation), (3) Honam (southwest), (4) Daegu and Gyeongbuk (n. southeast), and (5) Busan, Ulsan, and Gyeongnam (s. southeast) zones. Two special zones are Jeju and Gangwon zones

nationwide BRD, which aimed to balance the growth between the SMA and other local regions, by constructing regional innovation systems (RIS) in local regions. The Lee administration (2008–) continued to partly implement balanced regional development policies following the Rho administration, but the overall project scale and plans were reduced, and relevant policies were considered not to be very consistent (Table 8). The Lee administration showed a rather different view to the former Rho administration's approach to regional development. By introducing national and regional innovation systems (and heavier tax plans), the Rho administration tried to remedy interregional and personal disparities, which could increase socioeconomic instability. In contrast, the Lee administration has focused on increasing the efficiency of the market economy, but the global economic recession and socioeconomic instability associated with the inconsistency of economic policy and income polarization continued to frustrate its efforts.

Considering the position of Seoul (SMA) as one of the largest metropolitan areas (population: over 25,000,000) in the world economy, in the short run, the Lee administration did not have to try balancing any legacies of the past disequilibrium development made over the long run. Accordingly, its development project or economic zone designation was made on the zero base without considering such balance and policy priorities were set from the viewpoint of efficient allocation of resources for economic development. In the Lee administration, the official committees and regional policy title of "balanced national development" as the nationwide BRD changed just to "BRD." Together with these changes, in policy making, the personnel from the SMA also comprised the largest proportion of the policy agent for the first time in modern Korea. As shown in Figure 2, high-rank elites in the central government are still much from the SMA and the southeast.

In particular, the share of SMA elites increased most from 19.4% to 33% (Fig. 2). Such a trend is also natural because many local elites – regardless of the southeast or southwest – spent their prime age in the SMA (especially in Seoul) and foster their children in the 1960s. Many newly selected elites were elites born in the 1950s and spent their adolescent years in the SMA in the 1960s.

Recently, regional conflicts associated with disparities have evolved into the antipathy between the SMA and others (Hong 2005), as the SMA experience a positive cumulative causation (at least in terms of its quantitative growth and sustained population). The problem recognition made many previous studies (Kim 1989; Kim et al. 1991; Suh 1993; Hong 2005; Kim 2006; Choi et al. 2007) deal with regional disparities or imbalance. Among these studies, only Kim (2006) and Choi et al. (2007) pointed to the role of

**Regional Economic Development Policies of Korean Central Governments, Fig. 2** Regional high-rank elites (Y: %) in governments. Notes: Literally, Gyeongnam + Gyeongbuk = southeast province (영남); Jeonbuk + Jeonnam = southwest province (호남). Recently SMA (수도권) elites have sharply increased. The remaining percent of power elites reflects the shares of some elderly elites born in North Korea, Japan, or China, which are not included in this study. For selection criteria, refer to Appendix A. (Source: Author's compilations based on Chosun Ilbo (2009), Lee et al. (2006), and JoongAng Ilbo (2005))

elites or their social networks in regional development. Kim (2006) developed inequality indices of elites residing in a specific region by complementarily using the GINI inequality index and location quotients for the period 1994–2005. However, Kim (2006) discussed regional imbalance without a detailed method to compare the patterns of elite distribution and economic distribution. Together with the shift-share analysis of regional employment change between 1997 and 2005, Choi et al. (2007) conducted a network analysis of population change between South Korean regions for the period between 2000 and 2005. Their shift-share analysis and network analysis results supported that regional disparities have increased, but their network analysis was about interregional migration (population concentration), not regional economic outcomes or concentrations.

This study has reviewed and discussed whether the concentration of economic activity and projects – which reinforce economic relations in economic space – occurred in primate growth-pole regions and whether a polarized pattern of economic concentrations was sustained since the Park Chung-hee regime. The previous shift-share analysis (Choi et al. 2007; Park 2009) results also support the observation of a substantial and persistent concentration of industrial employment in primate growth-pole regions, Seoul and its metropolitan region (Gyeonggi and Incheon) and the Busan-Southeast growth-pole region. The gap between primate growth-pole regions (especially Gyeonggi and Incheon as Seoul's hinterland) and other lagging regions began to increase again 1 year later after the 1997 IMF crisis. Moreover, many industries' regional share effects in primate growth-pole regions did not greatly decrease even between 1997 and 1998.

In order to illustrate the need for a different set of policies or plans if new or more preferred patterns of economic activity are to emerge, this study has also reviewed the efforts made by the national (Rho) government to develop the nation's gradually diffusing economic activity and their consequences. The review and evaluations of all the former governments since 1962 may lead to the conclusion that their regional development policies were not very successful in "trickling down" economic outcomes away from the

growth-pole regions. It is evident that the primate growth-pole regions as national magnets of labor and capital (not to mention as regional magnets entitled growth centers, namely, Seoul for the SMA) have been sustained despite policy efforts to decentralize economic activity (Kim et al. 2003; Choi et al. 2007; Park 2009). The importance of examining social networks and their influence on the distribution of economic activities was highlighted by the review of two recent administrations' approaches to balancing regional development from the viewpoint of political economy, especially considering the interplay between "economic space" and "political space" (Perroux 1950).

In terms of regional development, these phenomena also provide the rationale for investigating whether "macroconsequence" (significant unintended consequences for a large group: Schelling 1978), which can be caused by "micromotive" (individuals' intentional human action), occurred in South Korea's economic space and political space. Previous studies (Hwang 1996; Cho 1975) also discussed the role of (elites') social networks in the policy process of economic development. These efforts, however, did not address the intersection of economic networks and social networks or the intersection of economic space and political space, lacking detailed discussion on the economic development policy process and the role of elites.

Despite the literature's limited attention to the intersection of economic networks and social networks, the role of elites and their social networks in formulating and implementing regional development policies is apparent because they themselves are decision-makers of those policies and strategies. Elite studies (Mills 1956; Domhoff 1990) and growth coalition or urban regime theory also support the rationale for researching such an intersection where the unification of (local) economic and political elite groups occurred, because their coalitions can impact a concentration of (local) economic activity. Thus, in light of the examination of "economic" growth poles, and a review of regional development policies and projects so far, a methodology for subsequent studies to incorporate social networks (analysis) and econometrics would help theoretically and scientifically understand those relationships between economic and social networks, so that the conclusions and policy recommendations supported by a more scientific data analysis can be provided.

## Conclusion

The present Moon administration may need to consider the above less highlighted "macroconsequence of micromotive," whose agents tend to rather naturally be inclined to familiar people, e.g., from hometown, alumni, or family relations, among 50 million people who have lived interactively for decades in almost the highest national population density in the world. Although development projects had tended to be relatively more concentrated in certain "strategic," special regions and influenced by social networks in the past policy making and implementation, the present and next administration should consider how to reflect inevitably or inherently political economic (or more broadly, socioeconomic) relations in policy making and implementation processes. Out of the conventional practice of policy making dominated by the personnel selected by spoils or patronage systems, the channels where, with their own ingenious and real-life ideas made from everyday or long-lived "local" experiences, people can participate "fairly" in the policy making for regional development may also need to be prepared systemically. This will be one of the possible routes for people to make endogenously balance and develop their regional economies. In the past, development was top-down, but this bottom-up approach to developing local regions endogenously can effectively work through a system like a digitally signed online suggestion of development projects by any interested and cooperative people since ordinary adults or any group of legal persons have their own digital signature already. The transparency of policy idea and project suggestion reception might need to be opened, and, in the benefit-cost analysis, there should be a way for such interested participants to hear about its basic

principles and methods (by assistance of experts' kind and easier explanation if needed) and participate in it.

Of course, representative democracy and local autonomy have developed in the civilian governments since the mid-1990s in Korea. However, lots of politicians or political public servants tend to act selfishly and counted votes for the sake of their reelection, as explained by the public choice theory, which calls for the above more direct democratic system assisted by the digital government channels through sharing and protecting individual ideas and detailed suggestions under individual or cooperative digital signatures. This kind of system would help establish more desirable channels through which people interact to form economic space and political space across their own interests and their physical regions.

For developing countries in the other parts of the world, similar phenomena can happen and could have already occurred. Toward the future, hence, people should look back on whether economic growth is too emphasized in order to compensate any insufficient political legitimacy. However, at the same time, it should be noted that such retrospective view of past top-down regional development is just to derive lessons for the way toward bottom-up and endogenous regional development from now on.

The central government need to help local people find and inform or share their indigenous resources to develop their regions through diversified bottom-up strategies, which may also help the growth of national economies when such strategies can work in accordance with the central government's resource allocation plans and intended projects. Education and sharing of regional histories and cultures may also help make synergies between regions. Much of such sharing was made without government consideration, but any government, even regardless of developed and developing countries' assistance for it, will also be important to better understand our region, their region, and national region more effectively in a homogeneous field of forces and to expand it outside the national boundary in this age of glocalization.

# Regional Executives, Russia

Ivan Leksin
School of Public Administration, Lomonosov Moscow State University, Moscow, Russian Federation

## Synonyms

Executive bodies of constituent units of the Russian Federation; Executives of constituent units (constituent entities) of the Russian Federation; Regional governments and administrations

## Definition

Each of the 85 regions (constituent units) of the Russian Federation forms its executive system, which includes the chief executive, the higher executive body, and subordinate institutions.

The chief executive is officially titled governor in the most regions (krays, oblasts, cities of federal significance, autonomous oblast, and autonomous okrugs), except the city of Moscow headed by a mayor. The republics' chief officials until recently were, as a rule, styled presidents, on the analogy of the federal president. Currently they are mostly designated as heads of the republics, as the active federal legislation bans the usage of the words, composing the title of the head of the Russian state, in the titles of the regional leaders. The Republic of Tatarstan is the only constituent unit of Russia that retains the presidential title for its chief executive, despite the mentioned ban.

The higher executive body of the constituent unit of the Russian Federation is formed by the chief executive and is usually titled government (in official Russian language, this term refers to an executive body that exercises general jurisdiction). As a rule, regional governments are collegial bodies. In a few republics such bodies are officially called cabinets of ministers, and, finally, in about one fifth of the regions, administrations are formed.

Subordinate to these bodies are numerous institutions of different types that are named ministries, departments, boards, committees, commissions, inspections, inspectorates, agencies, services, etc. Some of these institutions are comprised of a single central office, and the others include several offices dispersed over the territory of the region.

## Introduction: Autonomy Versus Hierarchy

Being a federal country, Russia is supposed to have a two-tier governmental structure. The federation and the regions are constitutionally declared to have separate governments. Both the federation and its constituent units form their own legislatures, executives, and courts. However, Russia is not a regular federation (see ▶ Constitutional Federalism and Public Administration, Russia) with politically and administratively self-standing orders of government, but a state of

an ambiguous kind in which institutional decentralization sides with functional centralization and where federal and regional executives constitute quite a sophisticated and twisted network.

The constituent units' executives have a considerable list of powers, according to the Federal Law No. 184-FZ dd. 6 October 1999, "On the General Principles of Organization of the Legislative (Representative) and Executive Bodies of Constituent Entities of the Russian Federation" (thereinafter the federal law on the general principles). No formal subordination between federal and regional executives is provided for. However, the latter are exposed to indirect and informal influence of the federal government:

- Most constituent units of the Russian Federation are financially dependent on the federal transfers.
- A regional leader can be removed from office by the federal president in case of dereliction of duty, corruption, etc.
- Most regional leaders belong to the dominant political party and have to maintain party discipline.
- The federal council of ministers (officially titled the Government of the Russian Federation) enacts administrative decisions that are legally binding for both federal and regional ministries and other executive bodies.
- Both federal and regional ministries and other executive bodies are responsible for public administration in various spheres (health care, education, social service, etc.), which makes the regional executives subordinate to the standards set by the federal ministries.
- Regional governments regularly report directly to the presidential administration on various matters (economic growth, social welfare services, etc.).
- In every constituent entity of the Russian Federation, dozens of agencies of federal ministries and other bodies exist that either operate in parallel with their regional counterparts or monitor activities of the latter and influence them.

## Constitutional and Legislative Framework

The current Constitution of the Russian Federation does not contain detailed provisions devoted to regional executives. It stipulates only:

- For the observation of the separation of powers on both federal and regional levels of government (Art. 10 of the Constitution)
- For the regions' discretion in formation of their governments (Art. 11 and Art. 77, para. 1 of the Constitution)
- For the conformity of the said formation with the "general principles" to be set by a federal law (Art. 72, para. 1, and Art. 77, para. 1 of the Constitution)
- For the "unity" of the system of federal and regional executives, referring to exercising federal powers (Art. 77, para. 2 of the Constitution)

These scarce provisions had never been changed. However, since the adoption of the Constitution of the Russian Federation in December 1993, formation procedures of the regional executives and their construction and powers had altered dramatically following the growth of the federal legislator's political weight. Currently there are two federal laws that contain quite detailed provisions on the mentioned issues leaving few matters at the regional discretion. These are the mentioned Federal Law on the general principles and the Federal Law No. 67-FZ dd. 12 June 2002, "On the Basic Guarantees of the Russian Citizens' Electoral Rights and the Right to Participate in Referenda."

In conformity with the federal laws, the constituent units of the Russian Federation enact their own laws and bylaws. Provisions regarding institutional structure of the regional executives, their formation, and division of powers between them are usually dispersed between the constitution (in republics) or the statute (in other regions), ordinary laws, chief executive's decrees, and regulations of the region's government or administration (Kryazhkov 2002).

Regardless of this dispersion, the issues related to the regional executives had been gradually assimilated by the federal legislator during the last two decades, thus leaving less space for the regional regulation.

## Composition and Structure

Up until the abovementioned Federal Law on the general principles had come into force, the constituent units of the Russian Federation enjoyed much freedom in designing their executive systems, as well as in determining position of the executive bodies toward the other regional institutions. Sometimes it led to dominance of the legislature over the executive (see ▶ Constitutional Law and Public Administration, Russia), but, usually, to actual monopolization of the regional authority by the latter.

Diversity of the regional political systems had not vanished, but it decreased dramatically. At present, this diversity refers only to the composition of bodies within branches of government and, in some cases, to selection between few formation modes offered by the federal legislator (Leksin 2016). As far as the construction of the regional executive is concerned, the following patterns are typical at present.

In most constituent units of the Russian Federation, higher executive bodies are councils of ministers or of similar officials that take decisions collectively. Such councils generally include up to two or three dozen officials, generally political ones. As mentioned above, these bodies are usually titled "governments," by analogy with the federal one. In few constituent units of Russia, their higher executive bodies are called administrations. Most of these function under personal leadership of the regional governor, head of the republic, etc. Unlike the governments, administrations are usually staffed by hundreds of officials, the latter being civil servants predominately. Regardless of the type of the higher executive body, it is being considered as a subordinate one to the chief executive of the region (head of the republic, governor, etc.).

As the executive body titled "government" is just a collection of a few officials, dozens of specialized bodies headed by these officials (as well as by the ones not included in the government) inevitably exist under the government. These bodies are styled at the region's discretion (see above). In other constituent units of the Russian Federation, the institutions that perform functions similar to the ones subordinate to the "governments" can either be styled as departments of the "administrations" or exist as separate legal entities. However that may be, in practice, a deal of specialized executive bodies operate in every constituent entity of the Russian Federation.

Besides, in every constituent entity of the Russian Federation, nongoverning bodies exist within the system of the regional executive. These bodies provide support for the chief executive and the "government" and are called apparatuses, as a rule (there can be separate apparatuses or a single apparatus for both).

## Allocation of Functions

According to the Federal Law on the general principles, the functions should be distributed within the regional executive in the following way. The chief executive of the constituent unit of the Russian Federation represents the latter in relations with other governments, signs regional acts and agreements, issues acts sui juris, and signs and promulgates regional laws. This official (either personally or conjointly with the regional legislature) forms the higher executive body and takes a decision on its resignation. He or she also coordinates activities of the regional executive bodies and ensures interaction between the latter and the federal and local governments.

The higher executive body in its turn is primarily responsible for:

- Implementing measures aimed at realization, safeguarding, and protecting the rights and freedoms of man and citizen, at protecting property and public order, at countering terrorism and extremism, and at crime control

- Drafting the budget of the constituent unit of the Russian Federation, as well as the programs of regional economic development, ensuring budget performance and reporting on it to the regional legislature
- Managing and disposing of the regional property
- Forming subordinate executive bodies

The latter (ministries, departments, boards, committees, etc.) perform regulatory, supervisory, and other administrative functions and provide services to the citizen and juridical entities within the fields of their specialization.

## Chief Executives: Status Development

Initially, federal and regional electoral legislations are developed separately, and the federal parliament did not infringe upon constituent entities' rights to regulate regional governments' formation, as electoral law was not placed by the federal constitution directly under federal, regional, or joint jurisdiction.

However, by December 1993, only a quarter of the 89 then-current constituent entities of the Russian Federation elected their chief executives by popular vote. Most of these 20-some constituent entities had a constitutional status of republics (these being the original constituent entities of the Russian Soviet Federative Socialist Republic).

The other Russian regions (krays, oblasts, cities of federal significance, autonomous oblast, and autonomous okrugs) gained political autonomy by signing the Federative Treaty on 31 March 1992 and were called equal to the republics by the Constitution of 1993, but most of them had not adopted electoral laws until the mid-1990s. Therefore, most regions at the earliest stage of their existence as constituent entities of Russia were being headed by chief executives (governors) either appointed by the President of the Russian Federation or nominated by the latter for appointment by the legislatures (soviets) of the respective regions.

In December 1995 the status of the higher regional officials changed dramatically. The Federal Law No. 192-FZ dd. 5 December 1995 "On the Procedure for the Formation of the Council of the Federation of the Federal Assembly of the Russian Federation" provided that the regional chief executives became ex officio the members of the Council of the Federation (the upper chamber of the federal parliament). Besides, the said Federal Law ordered to accomplish elections of the chief executives of constituent entities of the Russian Federation by December 1996. This new design was a result of an informal concord between President Yeltsin, who expected the ex officio senators to become more persuadable as compared with the popularly elected ones, and the State Duma (the lower chamber) of the Federal Assembly, which apprehended the risk of filling the upper chamber with presidential assignees and thus wished to put an end to appointment of governors by the federal president.

By having achieved this new status, regional governors and presidents received not only legislative powers but also immense opportunities to influence federal policy. Under the provisions of the Art. 98 of the Constitution of the Russian Federation, they got parliamentary immunity through the term of their service as members of the federal parliament.

The next stage in the development of the regional chief executives' status had begun with enactment of the abovementioned Federal Law on the general principles. This law turned out to be one of the most controversial ones in the modern Russian history. Having been provided by the articles 72 and 77 of the Constitution of the Russian Federation and seeming to be quite inoffensive by its title, it eventually became a powerful weapon of recentralization. At the origin its provisions did not violate regional autonomy much. Nevertheless, its passage through the parliamentary procedures was doubtful, as it became the first noticeable attempt to set federal restrictions for the regional officials. Particularly, it disallowed chief executives of constituent entities of the Russian Federation to stay in office for more than two consecutive terms and provided for their removal from office upon the vote of nonconfidence passed by the regional legislative.

Ultimately, this disputable law received approval, and its latent force revealed itself before long. On 29 July 2000, the first amendment (No. 106-FZ) to this law was sanctioned, and within the next 16 years 140 amendments followed. The mentioned amendment dd. 29 July 2000 was a significant victory of the centralists. It authorized the President of the Russian Federation to dismiss chief executives of constituent entities of the Russian Federation under certain circumstances. As a prerequisite to the said dismissal, a presidential warning was determined. The President of the Russian Federation could make such a warning on two occasions. The first occasion was a 2-month dereliction of the regional higher official to the court decision, establishing a conflict between federal law and a decree of the regional governor or president. The second occasion was a 2-month dereliction of this official to the Decree of the President of the Russian Federation suspending a regional bylaw (the latter having been issued either by the higher official himself or by the cabinet or administration of the constituent entity of the Russian Federation). According to the Law, dismissal of the regional chief executive became possible once the latter ignored the presidential warning for a month since it had been issued.

On 5 August 2000, a new Federal Law "On the Procedure for the Formation of the Council of the Federation of the Federal Assembly of the Russian Federation" was enacted, that put an end to membership of the regional higher officials in the Council of the Federation and therefore to their immunity from prosecution. Despite the strong opposition of many senators, the bill was finally approved by the upper house.

The Federal Law on the general principles continued being subjected to modifications as well. On 11 December 2004, the most disputable amendment to the latter was sanctioned. Enactment of this amendment was prompted by the terrorist attack on a school in the constituent Republic of North Ossetia-Alania. This occasion raises popular indignation and was regarded as a proof of inoperability, inertness, corruption, and lack of responsibility of the regional governments. Given the high level of public confidence in the federal president, putting the higher officials of the regions under federal control had been considered as a due remedy.

By provisions of the mentioned Federal Law, popular elections of the chief executives of constituent entities of the Russian Federation were replaced with an ambiguous procedure of "vesting of a citizen of the Russian Federation with the authority of a chief executive of a constituent entity of the Russian Federation," This "vesting" was a hybrid of presidential appointment and parliamentary election: the President of the Russian Federation nominated a candidate, and the regional legislature was to decide upon it.

Participation of the federal official in regional governments formation caused a discussion in academic circles, but conformity of the new provisions with the Constitution of the Russian Federation did not become a subject of inquiry at the Constitutional Court of the Russian Federation, although participation of a regional legislative body in formation of the executive of a constituent entity of the Russian Federation was litigated in the federal Constitutional Court in 2005 in view of possible violation of the constitutional principle of the separation of powers, with no success, however (for further information, see Leksin 2012).

Besides, the mentioned amendment dd. 11 December 2004 enhanced the power of the President of the Russian Federation to dismiss regional chief executives. The President of Russia was entitled to remove governors and presidents of constituent entities of the Russian Federation from their offices in case they lost his confidence or executed their duties improperly. For such reasons to dismiss a regional governor or president, no warnings or court decisions were provided as prerequisites. Besides, the vote of nonconfidence passed by the regional legislative was turned into the ground for discretional removal of the regional chief executive from his or her office by the President of the Russian Federation.

The actual political context allowed experts to assert that "vesting of a citizen of the Russian Federation with the authority of a chief executive of a constituent entity of the Russian Federation"

came practically to appointment by the President of the Russian Federation. On this ground many scholars argued that the said Federal Law deprived the regions of the remains of their autonomy, thus having reverted the Russian Federation to a unitary state (Avakyan 2007).

Additionally, 5 years later, the President of the Russian Federation received a right to appoint an acting chief executive of a constituent entity of the Russian Federation at his own discretion, with no approval by the regional legislature. The amendment No. 319-FZ dd. 17 December 2009 to the said Federal Law regarded poor health or other circumstances temporarily impeding the regional chief executive to exercise his duties as due reasons for appointment of an acting regional leader. The Law substantiated this new instrument of federal intrusion into regional affairs by the purposes of protecting the rights and legitimate interests of citizens of the Russian Federation. According to the amendment, the President of the Russian Federation was entitled to appoint the acting chief executive for the period while the cited circumstances persisted.

The described legal framework existed with minor changes till 2012 when popular elections of the regional leaders were reestablished following the rise of the public complaints against the construction of the political system.

The amending Federal Law No. 244-FZ dd. 2 May 2012 to the Federal Law on the general principles stipulates that the chief executive of a constituent entity of the Russian Federation shall be elected by the citizens of the Russian Federation residing in the given constituent entity. The elected chief executive shall serve a term specified in the regional constitution (in case the constituent entity enjoys a status of a republic) or in the regional statute (in other cases). This term cannot exceed 5 years (the same restriction had an effect upon presidential nominees), and no one can stay in office of the chief executive of a certain region for more than two consecutive terms.

This office can be occupied by a citizen of the Russian Federation, who has neither a citizenship of a foreign state nor the right to permanently reside in a foreign state. A candidate must be at least 30 years old. Under the provisions of the Federal Law, candidates shall be nominated by political parties that are entitled to nominate either their members or nonparty persons.

The Federal Law on the general principles does not provide for self-nomination for the chief executive of a constituent entity of the Russian Federation, but it allows the constituent entities of the Russian Federation to set such provisions in regional laws. However, self-nomination does not release a candidate from the partisan influence. The nomination of a candidate either by a political party or by himself requires support by a certain number (to be established by a regional law) of municipal deputies and/or of higher officials of municipalities within a region. A candidate has to enlist such support in at least three fourths of municipal districts and urban circuits of the constituent entity he intends to head. Many of these municipal deputies and executives are party members, and this naturally means that a fairly independent nominee for the regional chief executive has fewer chances to gather the required support for his candidacy.

All self-nominees have, apart from obtaining the support of municipal deputies and higher officials of municipalities, to collect a certain number (to be established by a regional law) of voters' signatures. Partisan nominees are exempted from this obligation.

The President of the Russian Federation reserves the right to hold consultations with the political parties nominating for the chief executive of a constituent entity of the Russian Federation (as well as with the self-nominated candidates). No punishment is provided by law for evasion from such consultations, but still they can be regarded as an instrument of federal influence on political context in the constituent entities of the Russian Federation. At the same time, it is quite doubtful that any party or a self-nominee would miss the opportunity to benefit from such a media event like a meeting with the federal president during their election campaign.

Besides, the President of the Russian Federation retains several more effective powers

providing for keeping chief executives of constituent units of the Russian Federation under control.

Firstly, the federal president still has the right to dismiss regional leaders under the procedure set by the mentioned amendment dd. 29 July 2000 to the Federal Law on the general principles.

Secondly, the said Federal Law still provides for removal of a regional leader from office due to his having lost the confidence of the President of the Russian Federation or due to improper execution of his duties. The only difference is that now the Law specifies the grounds for loss of presidential confidence. Until the amendment dd. 2 May 2012 was enacted, these grounds were a matter of presidential discretion. The said amendment names only detection of the facts of corruption and failure to settle a conflict of interests as due grounds.

Thirdly, the said amendment dd. 17 December 2009 to the Federal Law on the general principles, allowing the President of the Russian Federation to appoint an acting chief executive of a constituent entity of the Russian Federation, remains in force.

Moreover, the amendment dd. 2 May 2012 established four new legal instruments destined to compensate for the risk that popularly elected regional officials will contract out of the federal influence.

First, the amendment provided for a new ground for removal of a regional leader from his office. The President of the Russian Federation is now entitled to dismiss a chief executive of the constituent entity of the Russian Federation in case of his monthly failure to fulfill the decision of the Constitutional Court of the Russian Federation, regarding a decree issued by this regional leader.

Second, in order to assume the office, the elected candidate shall take an oath of fealty not only to the constitution (statute) of the certain constituent entity of the Russian Federation but also to the Constitution of the Russian Federation.

Third, the said amendment provided for a recall of the elected higher official of a constituent unit of the Russian Federation by the voters (the detailed procedure to be established by a regional law). Such recall shall be possible on the ground of breaching of the federal or regional legislation by the regional chief executive or his failure to fulfill his duties repeatedly without a sound reason (such breaching or failure to be established by the court). Voting for the recall of the chief executive of a constituent entity of the Russian Federation shall be called by the regional legislature. To recall the regional leader, a majority of registered electors should vote for it. Following the said recall, an acting chief executive of the region should be appointed by the President of the Russian Federation.

Fourthly, according to the Law, no person removed from the office of the chief executive of any constituent entity of the Russian Federation by the President of the Russian Federation cannot be nominated for this office at regional elections in any constituent entity of the Russian Federation within 2 years after the removal.

Since the described reform of 2012, dozens of amendments were made to the Federal Law on the general principles. Several of them are quite notable. The Federal Law No. 30-FZ dd. 2 April 2013 had suggested an alternative to the regional chief executive's popular election. According to this scheme, it can be provided by the constitution (or the statute) of the constituent unit of the Russian Federation that every political party represented in the regional legislature could submit up to three nominees for this office to the President of the Russian Federation. The latter shall then select three candidates among the said nominees and introduce them to the regional legislature. The latter in its turn shall elect the regional chief executive by secret ballot. Up to date, six republics and one city of federal significance prefer this scheme.

By the Federal Law No. 6-FZ dd. 3 February 2015, a similar but a more complex procedure had been provided for the indirect election of governors of the autonomous okrugs being parts of oblasts (on the issue of the phenomenon of a constituent unit of the Russian Federation being part of the other constituent unit, see ▶ Constitutional Federalism and Public Administration, Russia). The difference is that the regional

departments of political parties represented in the okrug's legislature submit the nominees for this office to the respective oblast governor, who preliminarily selects at least five nominees to be submitted to the President of the Russian Federation. All the three autonomous okrugs that are currently parts of the oblasts had decided to use this procedure. Thus at present in 75 regions, their chief executives are elected directly and, in ten, by the legislatures of the respective constituent units.

The last important novation to the Federal Law on the general principles was introduced by the amending Federal Law No. 298-FZ dd. 3 July 2016. This amendment had enhanced the controlling functions of the general government over the regional governments and officials.

## Answerability and Accountability

The regional executives are involved in a complex system of answerability. As mentioned above, the chief executive of every constituent entity of the Russian Federation is politically and legally responsible to the President of the Russian Federation, to the regional legislature, and to the voters.

Besides, as an administrator, every regional leader is since 2007 accountable to the federal government. Under the Federal Law on the general principles, he is obligated to submit reports on the regional advances to the President of the Russian Federation. The current list of indicators used to assess regional development had been approved by the Decree of the President of the Russian Federation No. 1199 dd. 21 August 2012, and the procedure of this assessment is set in the Decision of the Government of the Russian Federation No. 1142 dd. 3 November 2012.

The higher executive body (the "government" or the "administration") of the region is in its turn answerable to the chief executive of the latter, while the members of this body that had been appointed with the consent of the regional legislature (or with parliamentary participation of other kind) can be removed from their offices upon the vote of nonconfidence passed by this legislature.

The activities of the regional executives are being monitored by the various federal executive bodies according to their functional specialization and assessed by the Government of the Russian Federation. Moreover, since 2016, regional governments, including executive bodies, are subject to regular inspections conducted by the public prosecutors (which are federal officials) and by the supervisory executive bodies belonging to the federal level of government.

## Conclusion: Between Federal and Local Levels of Government

The current state of executive bodies of constituent units of the Russian Federation is a product of multiple and multidirectional factors. The Constitution of the Russian Federation proclaims autonomy of the regions in the issues regarding formation of their executives. However, the federal legislator proceeds from a quite broad interpretation of its right to set the principles of organization of executive bodies of constituent entities of the Russian Federation. Being supported by the Constitutional Court of the Russian Federation (see ► "Constitutional Law and Public Administration, Russia"), the federation had established detailed rules for formation of regional executives, as well as for their composition and functions.

Thus, being a detached order of government, the regional governments operate in close interrelationship with the general government and with the municipal ones. Among the regional bodies the executives are the ones that are linked with the other levels of government most tightly. They are to a considerable extent dependent on the federal financing, while the regional chief executives are in their turn answerable to the President of the Russian Federation and thus politically dependent on him. Besides, the regional executive is not the only set of executive bodies within the certain constituent unit of the Russian Federation. Regional executives have to work side by side with numerous agencies of federal ministries and other executive bodies and as a rule are outnumbered by territorial departments of federal executive bodies. Moreover, in many regions, the staff of such departments exceeds the total number

of civil servants of the certain constituent unit of the Russian Federation (see ▶ "Constitutional Federalism and Public Administration, Russia").

Apart from the formal rules and adjudications, informal political and administrative practices develop, leading to increased involvement of the governments of constituent entities of the Russian Federation into the common nationwide system of decision-making and implementation and to great interdependence of the federal and regional executives. As a result, today the latter perform an explicitly dual role, functioning both as executors of the regional laws and as the agents of the federal government, providing support for the federal policies concerning economical activity, sustainable development, financing, land management, disaster management, social maintenance, health care, education, cultural development, etc. Being such agents, the regional executives are accountable and, in many cases, turn to be actually subordinate to the federal ones.

A similar scheme is reproduced in relations between the regional and local governments.

## Synonyms

Budget deficit; Budget expenses; National debt; Regional and federal taxes; Regional management; Reserve fund; Subsidy

## Definition

Regional finances determine the development of Russia.

## Introduction

Condition and development of regional finances is the most important factor, defining the system of public administration in Russia at the regional level, its effectiveness. Practically all the managerial decisions, being made by the bodies of state power of the subject of the Russian Federation, demand financial provision. Full and timely financing of consumed powers of local authorities defines the level of socioeconomic development, quality, and level of life of Russian citizens in this region.

## Regional Finance in Russia

The compound sections of the system of regional finances are

– The budget of the subject of the Russian Federation (regional budget)
– The credit and the national debt of the subject of the Russian Federation

R

- The budget of the territorial state non-budget fund (the territorial fund of obligatory medical insurance)
- Finances of unitary enterprises and state institutes of the subject of the Russian Federation (official, autonomous, and budget institutes)

The volume of regional finances in Russia constitutes about 12% of the gross domestic product of Russia (approximately 160 billion American dollars at the end of 2015), and share in the consolidated budget of the Russian Federation is about 36%.

Regional finances are built on the basis of the principles of the budget system, established in Article 28 of the budget code of the Russian Federation, namely:

- Unity of the budget system of the Russian Federation
- Delimitation of the income, expenses, and sources of financing of the budget deficit among the budgets of the budget system of the Russian Federation
- Independence of budgets
- Equality of the budget rights of the subjects of the Russian Federation and municipal formations
- Fullness of reflection of the income, expenses, and sources of financing of the budget deficit
- Balance of the budget
- Effectiveness and efficiency of budgetary funds usage
- Common (total) defrayment of expenses of budgets
- Transparency (openness)
- Reliability of the budget
- Addressness and target character of budgetary funds
- Jurisdiction of budget expenses
- Unity of treasurer's office

Governmental authorities of the subject of the Russian Federation provide the balance of the regional budget and fulfilling the requirements, established by the federal laws and the Russian President and Russian Government's regulatory legal acts, of regulating budget legal relationships, implementation of the budget process, dimensions of the budgets deficit, the size and structure of the national debt of the subject of the Russian Federation, budget implementation, and execution of the debt instruments of the subject of the Russian Federation.

Budget formation, approval, implementation of the subject of the Russian Federation and controlling its execution are realized by governmental authorities of the subject of the Russian Federation independently carrying out all the requirements, established by the budget code of the Russian Federation and federal law dated 6 October 1999 № 184-FL "About the general principals of organizing legislative (representative) and executive bodies of state power of the subjects of the Russian Federation" and also adopted, according to them, regional laws.

The regional draft budget, the law about the regional budget, the annual report about implementation of the regional budget, and also information about the number of the state civil servants of the subject of the Russian Federation and the employees of the governmental institutes of the subject of the Russian Federation with referring to actual costs for their keeping are to be officially published.

Public hearings are conducted according to the regional draft budget and the draft of annual report about implementation of the regional budget.

Expenses of the regional budget are carried out in the forms, stipulated by the budget code of the Russian Federation. The bodies of the state power of the subject of the Russian Federation keep the registries of expense commitments of the region in accordance with the requirements of the budget code of the Russian Federation and, in order, established by the legal regional acts.

Governmental authorities of the subject of the Russian Federation define the amount and conditions of salary of their employees, the employees of state institutes of the subject of the Russian Federation, and they also determine the regional financial standards and other norms of the regional budget expenses for financial ensuring of their fixed powers.

Besides, the subject of the Russian Federation defines independently the conditions and the order of provision with interbudget transfers from the budget of the subject of the Russian Federation to the local budgets.

Since 2014 regional budgets in Russia have been made and approved for a period of 3 years. The regional budget has the form of the regional law.

The draft regional budget must be based on the budget projection. This is a document, which contains the prediction of the main budget characteristics, activities of the financial provision of the regional state programs, and the main approaches to the formation of the budget politics for a long-term period.

The budget projection of the region for a long-term period is worked out every 6 years for 12 years or more on the basis of the forecast of the socioeconomic development of the region for a corresponding period.

The financial body of the subject of the Russian Federation carries out the draft regional budgeting.

Consideration and approving of the draft regional budget are exercised by the legislative (representative) body of the public administration of the subject of the Russian Federation. Administration of the regional budget is implemented by the financial body of the subject of the Russian Federation together with the Federal Board of Treasury. As a total amount of the financial year, the report about the administration of the regional budget is made, considered, and approved in the form of the regional law.

Partial independence of the subjects of the Russian Federation supposes the opportunity to pursue their own regional financial policy with a glance of peculiarities of socioeconomic development of the concrete territory.

Regional financial policy includes the following areas:

1. The budget policy of the region
2. The policy of managing of the regional budget deficit and debt
3. The investment policy of the region
4. The policy of the financial control of the region
5. The policy of interbudget relations of the region
6. The policy of state purchases and contracts of the region
7. The regional taxation policy

Being carried out Russian reforms in the sphere of public administration establish new requirements for the governmental authorities of the subject of the Russian Federation.

Financing of the socioeconomic development of the subject of the Russian Federation must regularly go in the following main directions:

1. Timely and full execution of the current liabilities to nonprofit organizations and institutes with the aim of ensuring their activity
2. Maintenance of budget supporting of the enterprises in different branches of economics with the purpose of stimulation of the regional economic growth
3. Meeting social regional commitments in order to support the appropriate level of life in the subject of the Russian Federation

Execution of the Russian President's Decree dated 7 May 2012 № 597 "About the measures of realizing the state social policy" concerning the raising of employees' wages from the budget sphere (teachers, doctors, social workers) has a great importance in the modern regional budget policy.

Revenue of the regional budgets is determined by the budget code of the Russian Federation (RF).

Regions collect the revenue *in corpore* from the following regional taxes:

1. Organization property levy
2. Gambling business tax
3. Transport tax

As for regional taxes, regions have certain rights of tax administration and can establish the tax rate, give additional tax benefits, and set the terms of payment.

Apart from the regional taxes, the federal taxes are included completely or partially into the regional budgets:

1. The profit tax of the organizations
2. The individual's income tax
3. The spirit excise tax and products containing spirit excise tax
4. The car petrol excise tax, diesel fuel excise tax, and motor fuel excise tax
5. The alcohol excise tax
6. The beer excise tax
7. The state due
8. The tax collection after the usage of the objects of water recourses and animal world
9. The tax according to the simplified system of taxation

Concerning the federal taxes, the rights of tax administration for the regions are restricted.

Nontax budget revenue of the subjects of the Russian Federation contains:

- Revenue from the usage and selling of the belongings, being in the state property of the subjects of the Russian Federation
- Revenue from paid services, being facilitated by the regional state institutes
- Part of the revenue of the regional state enterprises

A considerable share in the overall revenue of the regional budgets is occupied by the financial help from the federal budget: dotations, subsidies, and subventions.

Dotations are intended for equalization of the budget guarantee and general balance of the regional budgets. Subsidies are given with the aim of joint financing of the particularly important powers of the regional authorities. Subventions are sent to the financing of delegated federal responsibilities in order to implement them on the regional level.

Expenses of the regional budgets provide the financing of the powers of authority of the subjects of the Russian Federation and costs, connected with the running of the regional state property. Expenses are formed on the basis of the list of expenditure commitments.

The foundation of forming the expenditure of the regional budgets is presented in Article 26.3 of the federal law dated from 6 October 1999 № 184-FL "About the general principles of organizing the legislative (representative) executive bodies of state power of the subjects of the Russian Federation."

Nowadays the bodies of the state power of the subject of the Russian Federation are responsible for quite extensive circle of the questions, connected with the ensuring the conditions of the citizens' life, support of economic development, realization of the social, and infrastructure projects on the territory of the region of the public administration. The amount of their own powers of the subjects of the RF has grown from 55 in 2005 to 105 in 2015. The amount of "delegated federal" responsibilities also has increased from 11 in 2005 to 117 in 2015.

The main finance-cost for the Russian regions are:

- Financing of getting publicly available and free-of-charge publicly preschool, general elementary, general basic, and general secondary education on the regional territory
- Financing the salary of the workers of the budget sphere on the level of the average salary in economics in this region
- Building and repairing the roads of regional importance (regional road fund)
- Building and repairing the objects of the social infrastructure (schools, kindergartens, hospitals, social institutes)
- Social support and social servicing of the elderly citizens and disabled people, citizens in the difficult life situation, orphan children, large families, and low-income citizens
- Supplying the local budgets with the financial help

The expenses of the regional budgets can also be referred to as:

- Keeping the regional theaters, museums, and libraries
- Environmental protection
- Support to farming and small and middle business
- Construction, agrarian, housing, veterinarian, water, and ecological inspectorate
- Supervising heating, gas, and water supply in the region
- Provision of population employment
- Prevention from emergency situations
- And others

Special non-budget territorial fund of the obligatory medical insurance finances renders medical assistance to the citizens in accordance with the regional program of obligatory medical insurance.

Expenses of the regional budgets in the sphere of health care provide rendering high-technology medical help, specialized emergency, and palliative medical help, carrying out the medical examinations and medical surveys.

Since 2013 in Russia, the program-target approach in the system of the public administration and local self-government has been introduced. Russian regions are moving to the so-called program budget, when the great share of expenses is formed within the framework of realization of the regional state programs.

The effectiveness of the regional budget expenses is estimated as implementing some given program characteristics.

Russian regions have an opportunity to use the budget deficit and attract borrowed funds for its financing. The maximum extent of the budget deficit of the regional budget composes 15% from the sum of the tax and nontax revenue of the regional budget.

The sources of financing of the budget deficit are:

- The budget credit of the federal budget.
- The credits of the commercial banks.
- The issue of the regional state bonds.
- The sale of shares belonged to the regional authorities as the shareholders.

Balancing of the regional budget is exercised at the stage of the budget planning in the following directions:

- Defining the budget deficit dimension and the sources of its financing
- Reallocation of the expenses by means of restricting the ones and increasing the others in accordance with the priorities of the regional budget policy
- Finding out some additional financial reserves of the region
- Attracting additional financial assistance of the federal budget
- Finding out the means of saving and rational usage of the budgetary funds

National debt of the subject of the Russian Federation – the whole set of all the debt instruments of the region. Its maximum size is established to a degree of 100% sum of the tax and nontax revenue of the regional budget.

If the national debt of the region overdraws the level of 50%, then this situation is estimated as a risky level and is liable to additional attention on the part of the bodies of the executive power of the subjects of the Russian Federation and Board of Treasury of Russia.

Debt instruments of the subjects of the Russian Federation may be short term (less than 1 year), medium term (from 1 to 5 years), and long term (from 5 to 30 years included).

Attracting the borrowed funds is carried out according to the program of national loans of the subject of the RF, which is a supplement to the regional budget.

The volume of expenditures for maintenance of the national debt of the subject of the Russian Federation must not exceed 15% of the volume of budget expenditures for execution of the region's powers.

Formation of the special reserve fund of the Russian Federation can be stipulated by the regional law. This reserve fund is intended for the conservation of expenses of the regional budget under drop in the budget revenue because of deterioration of the economic situation in the region.

Regional authorities exert great influence on the organizing and carrying out the local self-government in the region. Municipal policy is determined by joint decisions of the regional and municipal administrative bodies. That is why regional authorities use the consolidated budget of the subject of the RF, connecting the regional budget and the budgets of the municipal formations, as a managerial tool.

Many activities for estimating the effectiveness of work of the executive bodies of the subjects of the Russian Federation are calculated on the basis of the consolidated budget data of the subject of the Russian Federation.

The main unsettled questions of development of the regional finances in Russia are in the sphere of interbudget relationships. The problem of horizontal and vertical misbalances is very sharp in the budget system of Russia. Objective reasons of differentiation of Russian regions are revealed historically in the conditions of allocating of the taxable basis and also in political, economic-geographical, and nature-climatic factors.

According to the criterion of having regional budget dotations for the level equalization of the budget provision, the regions are divided into two groups:

- Donors – regions, which have the budget provision higher than the mean value that is why they do not get dotations
- Recipients – regions, which possess the budget provision lower than the mean value that is why they are given dotations

The aim of the dotation distribution among the regions is the realization of the conditions of the citizens' getting social and medical assistance, education, and other public and municipal services independently of the place of living, and these conditions are guaranteed by the Constitution of the Russian Federation.

In spite of significant positive changes of the finance-budget legislation, financial independence of the subjects of the RF stays relative so far. A greater part of Russian regions are related to the subsidized ones; in 2016 there are 71 from 85 regions.

The least provided regions are Republic of Tuva, Ingush Republic, Republic of Altay, Chechen Republic, Republic of Dagestan, Kamchatskiy Kray, Republic of the Crimea, Karachayevo-Cherkesskaya Republic, Chukchi Autonomous Okrug, and Republic of Kalmykia.

The most provided regions are Moscow, Tyumenskaya Oblast', Yamal-Nenets Autonomous Okrug, Saint Petersburg, Khanty-Mansi Autonomous Okrug, Sakhalinskaya Oblast', Leningradskaya Oblast', Moskovskaya Oblast', Tatarstan Republic, and Samarskaya Oblast'.

Financial support to the subjects of the Russian Federation is also maintained in the way of subsidies for the development of prior lines of the public policy, for example, agriculture, education, health care, mass sport, and infrastructure. Subsidies allow meeting the nationwide challenges on the regional level and are given to those subjects of the Russian Federation, which are ready to invest their budget funds in the development of their own economic potential.

Federal government realizes the state program of the Russian Federation "Development of the federative relations and creation conditions for effective and responsible financial regional and municipal management." The aim of this program is assistance to the steady regional budget implementation and improvement of quality of the financial regional management. The program must solve the following problems:

- The growth of financial independence
- Stimulation of regions to development of their own budget base
- A cut in budget deficit and national debt of the regional budgets
- Strengthening of the financial discipline and responsibility for effectiveness of budget expenditure of the regional budgets
- Ensuring transparency and openness of the regional budgets
- Conduct of rating of the regions according to the quality level of managing the regional finances

In order to increase the openness, regions must prepare and allocate "the budget for citizens" for

the general access in the Internet. This is a budget in a simple and clear form for usual citizens, which assist in raising the trust to the regional power.

## Conclusion

In conclusion, it is necessary to mention that regional finances in Russia define the quality and level of citizens' life, as the largest part of social commitment of the state relate to expense powers of the regions, which are implemented by them independently for account of regional budgetary funds. In connection with it, federal bodies of state power are highly interested in the effectiveness of regional management in the finance-budget sphere. Such interest is explained by the direct relation of efficiency of all the system of public administration from conditions created by the regional authorities. It is the regional development that defines the development of Russia as a whole.

## Synonyms

Regional authorities; Regional policy

## Definition

Organizing and regulating influence of public authorities on the activity of the population of the region, in order to streamline and reproduce, based on their power force.

## Introduction

*Region* is a defined area with distinct qualifying features to differ from other areas, comprising integrated and interrelated natural and social components. The Russian Federation (RF) interprets a concept of a region in a narrower, more "legalistic" fashion, as referenced in the *Key Provisions of the Regional Policies in the Russian Federation* in 1996, where it is treated as "…a part of the Russian Federation territory with common natural, socioeconomic, ethnic, cultural and other conditions." The concept was simplified in 2016: "a region is a part of the Russian Federation territory within the boundaries of a Russian Federation *constituent*" (On Approval of Public Policy of Regional Development in the Russian Federation until 2025, approved by the RF President's Decree #13 of January 16, 2017.). The region may coincide with the boundaries of a Russian Federation constituent or unite several constituents. When a region is a subject of law, it is understood solely as a Russian Federation constituent (Key Provisions of the Regional Policy in the Russian Federation, approved by the RF President's Decree #803 of June 3, 1996).

Every region has an area and a geographic position. The scale and geography make every region unique. This uniqueness is a function of physical geography and natural conditions, location of the region, its economy, social and political status, the pattern of its development, population, and many other factors.

### Zoning of the Territory of Russia

There are eight federal okrugs (clusters of regions) in Russia that may be considered *macroregions*. The key regions in the Russian map are the Russian Federation constituents, 85 of those as of 2014.

*Microregion* is a part of a region. It is normally an area (subregional administrative unit) within a Russian Federation constituent. For example, Rostov Oblast (a Russian Federation constituent territory) includes six subregions (economic districts) within the Oblast: Northern, Western (Donbass), South-Western (Azov area), Southern, Eastern, and South-Eastern.

Specific types of regions are referred to as *districts* (*raions*). The regional economy and economic geography operate with such concepts as economic districts, administrative districts, and intra-urban districts.

Comprehensive regional socioeconomic analysis forms the basis for regional development governance. The "regional governance" may be viewed as a combination of theory and practice of managing the socioeconomic processes in the region. The regional academia develops methods and mechanisms for the most effective and efficient achievement of goals and objectives in the regional development.

The main policy goal of the regional governance is the improvement of well-being of the people as part of *sustainable development*. The science behind the Russian regional governance is still at the shaping stage caused by the historic transition from the planned market economy at the end of the twentieth century.

The regional governance pursues the following objectives in the market economy:

- To review, forecast, and program a comprehensive regional development
- To develop conditions for strengthening the economic framework of the region
- To develop and implement the investment, research, and technological policy in the region
- To develop market infrastructure
- To support environmental safety

The regional governance formally deals directly with enterprises and entities owned by the federal constituents primarily. The regional governance makes a direct impact on these entities and an indirect impact on other entities in its territory.

Planning has been used for practical purposes since 1920s, and that time predetermined its sector-based approach rather than territorial approach, making it different from the Western countries' experiences. Focus on regional planning is a response to an obvious inefficiency of a sector-based planning approach to the national development governance.

Traditional administrative definition results in the recognition of some diversity: there are regions with cities playing a key role. Examples in the Russian Federation include Moscow, a city region, a stand-alone constituent of the Russian Federation. Such regions are atypical. Ultimately, Moscow is the only region out of 85 whose share of credit institutions and foreign investments exceeds 50%. Therefore, a good balance and equity promotion fiscal policy shall take into account in this diversity, and it is not a trivial task. Moreover, such a city would often dominate in all other sectors. The share of Moscow as a region in the gross regional product (GRP) and population of the country is almost 25% and 8%, respectively. This makes this region very inconvenient for the analysis. Dynamic comparison of different regions requires a functional understanding of the reasons and trends in the regional growth.

Authorities' performance are judged upon by the following indicators: regional income levels, population numbers, life expectancy, mortality rate, prevention of social orphanage, and unemployment rate. One of the very important criteria is the public opinion, the level of user satisfaction with the local officials' activities (Ministry of Regional Development of the Russian Federation. Department for Development, Comprehensive Assessment of the Activities of the Constituents of the Russian Federation and the Local Authorities. On Evaluation of Performance of the Executive Authorities of Constituents of the Russian Federation Based on the Outcomes of 2012. M., December 2013).

Decree #1199 of the President of the Russian Federation of August 21, 2012 *On Evaluation of Efficiency of Activities of the Executive Authorities of the RF Constituents* and Resolution #1142 of the Government of the Russian Federation of

November 3, 2012 (as revised by Resolution #957 of the RF Government of October 25, 2013) established a methodology for assessment of performance indicators for the activities pursued by the executive authorities and the rankings of the Russian Federation constituents based on the indicator data.

Rankings are based on the following indicators (Ministry of Regional Development of the Russian Federation. Department for Development, Comprehensive Assessment of the Activities of the Constituents of the Russian Federation and the Local Authorities. On Evaluation of Performance of the Executive Authorities of Constituents of the Russian Federation Based on the Outcomes of 2012. M., December 2013):

- Investments in the fixed assets (excluding budget allocations)
- Level of tax and nontax revenues of the consolidated budget of a constituent of the Russian Federation
- Small businesses' products (services) turnover
- Actual household disposable income
- Area of new housing to the total area of all housing stock
- Average annual unemployment rate
- Expected life expectancy at birth
- Graduates of public (municipal) general education institutions who failed at the Unified State Examinations to the total number of graduates
- Mortality rate (excluding mortality caused by external factors)
- Share of children deprived of parental care including those transferred under the care of unrelated people (foster care, adoption, custody (guardianship), family care homes, and foster families), and placed in the public (municipal) institutions of all types
- Public evaluation of performance of the executive authorities of constituents of the Russian Federation

Table 1 below shows the resulting rankings based on performance of executive authorities of some constituents of the Russian Federation.

The assessment of regional governance quality for 3 years resulted in the identification of 20 lead regions in 2016: Voronezh Oblast, Chechen Republic, Republic of Tatarstan, Lipetsk Oblast, Saint Petersburg, Sakhalin Oblast, Tyumen

**Regional Governance, Table 1** Performance evaluation rankings of the executive authorities of ten leading constituents of the Russian Federation

| Ranking | Region | Ratings | Grant allocated in 2013 (,000 Rub)[a] |
|---|---|---|---|
| 1 | Republic of Tatarstan | 64,408 | 325 925,3 |
| 2 | Belgorod Oblast | 62,864 | 318 112,1 |
| 3 | Voronezh Oblast | 60,872 | 308 032,0 |
| 4 | Krasnodar Krai | 53,908 | 272 791,9 |
| 5 | Kaluga Oblast | 52,184 | 264 067,9 |
| 6 | Tyumen Oblast | 52,036 | 263 318,9 |
| 7 | Chechen Republic | 52,000 | 263 136,8 |
| 8 | Yamalo-Nenets Autonomous Okrug | 51,536 | 260 788,8 |
| 9 | Kursk Oblast | 51,264 | 259 412,4 |
| 10 | Nenets Autonomous Okrug | 51,096 | 258 562,2 |

Source: Ministry of Regional Development of the Russian Federation. Department for Development, Comprehensive Assessment of the Activities of the Constituents of the Russian Federation and the Local Authorities. On Evaluation of Performance of the Executive Authorities of Constituents of the Russian Federation Based on the Outcomes of 2012. M., December 2013

[a]The RF public program Regional Policy and Federative Relations. Approved by Instruction #435-r of the RF Government on March 26, 2013, it provides for consolidation of grants and donations to promote the tax capacity building (targeted support for well-balanced regional budgets). The program was funded with the allocation of 5,278,300 million Roubles. In 2013, the grant amounts vary from 240 to 330 million Roubles

Oblast, Tambov Oblast, Nenets Autonomous District, Moscow Oblast, Republic of Ingushetia, Republic of Mordovia, Chukotka Autonomous District, Tula Oblast, Kursk Oblast, Republic of Sakha (Yakutia), Rostov Oblast, Yamalo-Nenets Autonomous District, Khanty-Mansi Yamalo-Nenets Autonomous District-Yugra, and Belgorod Oblast.

Governors' performance rankings (Governors performance ratings for 2014.) are developed on the basis of the data from the Public Opinion Fund, Federal Service of Public Statistics of the Russian Federation, National Monitoring Service, and social status indicators of the Russian regions and assessment of the federal and regional experts. Top officials from Yamalo-Nenets Autonomous District, Kaluga Oblast, Republic of Tatarstan, Belgorod Oblast, City of Moscow, Kemerovo Oblast, and others got into the first category of officials "with a very high ranking" (above 75 score), according to the third release of rankings (2014 version).

This rating methodology incorporates five modules. The first (core) module is based on the results of the Public Opinion Fund, Georating, and evaluation of the head of the relevant constituent of the Russian Federation, taking into account a regional situation in the RF constituents.

The second module is about the household cash revenues and expenditures ratio in the region under review.

The third module is about the position of a relevant region in the rating of social status of the Russian regions.

The fourth module concerns assessment of the constituent's economy by its population.

The fifth module is the ratio of positive and negative information about activities of the regional head in the media.

The National Research University Higher School of Economics issued the second release of Innovative Development Rankings of the RF constituents in 2014 (the first release of rankings was published in 2012).

The rankings take into account an extensive list of indicators (36 in total) broken down into four thematic blocks (with 13 subblocks):

- Socioeconomic environment of innovative activities
- Research and technical capacity
- Innovative activities
- Quality of innovation promotion policy

The resulting rankings of the Russian Regional Innovative Index (RRII) include four groups of regions (Rankings of the Russian Federation constituents by the Regional Innovative Index values.) (see Table 2).

Concept Policy on Social and Economic Development of the Regions of the Russian Federation (Ministry of Regional Development of the Russian Federation, January 22, 2007 (typology developed on the basis of Conceptual Strategy of the Socioeconomic Development of the Regions of the Russian Federation) – http://www.minregion.ru.) proposed a new typology of the RF regions aimed at governance strengthening (2007). The typology took into account various degrees of regional involvement in the globalization, urbanization, and neo-industrialization processes. In view of long-term prospects, the RF Ministry of Economic Development has focused on specific features of every regional type, as

**Regional Governance, Table 2** Rankings of the Russian Federation constituents by the Regional Innovative Index values

| Region | RRII group | RRII ranking | RRII value |
|---|---|---|---|
| Moscow City | I | 1 | 0,5850 |
| Republic of Tatarstan | I | 2 | 0,5606 |
| Saint Petersburg City | I | 3 | 0,5382 |
| Nizhny Novgorod Oblast | I | 4 | 0,5006 |
| Kaluga Oblast | I | 5 | 0,4934 |
| Chuvash Republic | I | 6 | 0,4926 |
| Sverdlovskaya Oblast | I | 7 | 0,47547 |
| Tomsk Oblast | I | 8 | 0,47545 |
| Moscow Oblast | I | 9 | 0,4751 |
| Ulyanovsk Oblast | I | 10 | 0,4661 |
| Perm Krai | I | 11 | 0,4594 |
| Novosibirsk Oblast | I | 12 | 0,4584 |

identified through a comprehensive review of social and economic indicators and experts' assessments. The types vary from regions – locomotives of growth (global cities and cities of federal importance) to backbone regions (whose economy is driven by natural resources and old manufacturing facilities) to depressed regions (background and crisis-hit) (N. Yermakova and A. Kaloeva. Typologies of Regions for the Purposes of Regional Policy: Training manual. – SPb.: SPbGUEF Publishers, 2011).

There are many papers discussing definition and research of "depressed regions" and related typologies (M. Lyashevskaya, L. Smirnyagin, and G. Bylov; L. Ivanchenko, S. Khursevich et al.); some researchers emphasize ambiguity and ambivalence of the term itself (S. Khursevich).

The budget structure is always in line with the public governance system, resulting in a three-tiered budget.

Every budget tier is independent, meaning that it has its own revenues and spending mandates without any responsibility for the budgets of other tiers.

Consolidated budgets are an analytical tool to be developed for the analytical purposes only.

The formulation of budgets is in line with the legislation approved by the RF constituents for the next year or two of their planning process.

The main goal of budgeting is the establishment of the environment for balanced development of the fiscal system as a whole. Budgeting seeks to promote dynamic development of the society and economy and to meet the social commitments of the government before the citizens. This statement is true of any budget level, not just the federal one.

*Both the RF constituent's budget* (or regional budget) and a budget of a *territorial state extra-budgetary fund* are expected to meet the spending commitments of the RF constituent. The region's budget and a combination of municipal budgets within the region form a consolidated budget of the RF constituent.

*Budgets of municipalities* within a region are not included in the regional budget.

Consolidated budgets are used for statistics and for the analysis of the regional budget system.

Regional budgets are expected to meet the spending obligations of two types:

- Resources allocated for meeting the spending mandates of the RF constituents emerging from authorities of the regional bodies within the competencies of the RF constituents under Article 73 of the RF constitution in the implementation of the tasks owned by the RF constituents;
- Authorities associated with the tasks jointly owned by the federal and regional powers to meet the commitments of the RF constituents funded through the subventions from the federal budget.

In accordance with Article 72 of the RF constitution, they include:

1. Ensure the compliance of constitutions, laws, articles of association, and other regulations of RF constituents (krais, oblasts, cities of federal significance, autonomous regions) with the RF constitution and federal laws.
2. Protect the rights and freedoms of an individual and citizen; protect the rights of ethnic minorities; ensure compliance with law, public order, and public security; and implement the border zones regime.
3. Issues related to ownership and the use and management of land, subsoil, water, and other natural resources.
4. Delineation of state property rights.
5. The use of natural resources, environmental protection, and safety; specially protected natural areas; and protection of historic and cultural legacy.
6. General issues of education, research, culture, fitness, and sports.
7. Coordination of health issues; protection of family, motherhood, fatherhood, and childhood; and social protection, including social welfare.
8. Implementation of measures to control accidents, natural disasters, epidemics, and elimination of their consequences.
9. Establishment of general taxation principles in the Russian Federation.

10. Administrative, procedural, labor, family, housing, land, water, forestry, subsoil, and environmental legislation.
11. Judicial, law enforcement, lawyer, and notary staff.
12. Protection of native habitats and traditional way of life of small ethnic communities.
13. Establishment of general organizational principles for state authorities and local governments.
14. Coordination of international and external trade relations of the RF constituents and implementation of international agreements of the Russian Federation.

The Article provisions apply equally to the republics, krais, oblasts, cities of federal importance, autonomous oblast, and autonomous districts.

The Constitution defines a framework of obligations with further details specified in Federal Law #184 *On General Principles of Organization of Legislative* (*Representative*) *and Executive Bodies of State Power of the Constituents of the Russian Federation*.

## Regional Sources of Revenues and Expenditures

*Budget revenues* are money transferred to the budget except for the money to finance budget deficit.

Regional budgets' own revenues, as well as those of budgets at other levels are divided into tax, nontax, and gratuitous transfers (Article 47 of the Budget Code). Figure 1 below provides a more detailed structure of the regional budgets' revenues.

Tax revenues include two groups of taxes: regional taxes and federal ones.

Regional taxes are as follows:

1. Corporate property tax
2. Tax on gambling business
3. Vehicle owners' tax

Federal taxes and fees, including the ones paid under special tax regimes:

1. Tax on profit of organizations at the rate set forth for crediting the above tax to the budget of a constituent of the Russian Federation

**Regional Governance, Fig. 1** Types of revenues of the regional budgets

2. Tax on profit of organizations under the production of sharing agreements signed before the effectiveness of the Federal Law *On Production Sharing Agreements*, when they do not foresee special tax rates for crediting the above tax to the federal budget and the budget of a constituent of the Russian Federation
3. Personal income tax
4. Personal income tax to be paid by foreign citizens as a fixed advance payment when they work in the territory of the Russian Federation on a patent (prepaid license) basis
5. Excise on ethyl alcohol produced from edible raw material
6. Excise on alcohol-containing products
7. Excise on gasoline
8. Excise on various alcohol-based products at the rates associated with relevant products
9. Tax on extraction of commonly occurring mineral resources
10. Tax on extraction of mineral resources (except for the hydrocarbons, natural diamonds, and commonly occurring mineral resources)
11. Tax on extraction of mineral resources in the form of natural diamonds
12. Regular payments for the extraction of mineral resources (royalty) under the production of sharing agreements in the form of hydrocarbon raw materials (except for combustible natural gas)
13. Fee for using water biological resources (except for the internal water bodies)
14. Fee for using water biological resources (applies to the internal water bodies)
15. Fee for using wildlife resources
16. Tax collected in relation to the use of a simplified taxation system
17. Minimal tax collected in relation to the use of a simplified taxation system
18. Various types of official duties (subject for crediting at the location of official registration, or execution of legal acts, or issue of documents)

The revenue base may differ in the cities of federal importance, like Moscow and Saint Petersburg, or in regions (krais and oblasts) which include autonomous districts.

Regional governance bodies may:

- Introduce regional taxes
- Establish tax rates
- Establish additional standards for the contribution of personal income tax to the local budgets, at the rate of at least 15% of the tax revenues of the constituent's consolidated budget
- Provide tax breaks on the regional taxes

Special tax regimes may be associated with:

- Flat tax sharing rate for all settlements
- Flat tax sharing rate for all municipalities
- Flat tax sharing rate for all urban districts

The above rates and standards shall remain valid throughout the entire period of the budget effectiveness (1 or 3 years), as established by an RF constituent for its municipalities. The personal income tax may serve as an example of a regulating role of a regional budget.

RF constituents may raise nontax revenues for their budgets through:

1. Revenues from the operation of state assets owned by the RF constituents, except for the assets of budget and autonomous entities of the RF constituents and the assets of state unitary enterprises of RF constituents, including public establishments
2. Revenues from sale of assets (excluding shares and other forms of capital participation), in state ownership of RF constituents, except for movable assets of budget and autonomous entities of the RF constituents and the assets of state unitary enterprises of RF constituents, including public establishments
3. Revenues from fee-based services provided by pubic establishments of the RF constituents
4. Partial revenues of unitary enterprises established by the RF constituents, after

payment of all taxes and other mandatory fees to the budget at the levels under the procedure described in the laws of RF constituents
5. Fees for a negative impact on the environment
6. Fees for use of forests
7. Declaration fees
8. Revenues from sale of land parcels
9. Revenues from sale of immovable properties simultaneously with the land parcels occupied by such properties
10. Fees for the use of water resources owned by the RF constituents
11. Once-only payments for subsoil use if specific events occur as agreed upon in the licenses (bonus payments), for the parts of subsoil resources containing diamond deposits

Revenues to the budgets of RF constituents – cities of federal significance (Moscow and Saint Petersburg) – differ from other constituents due to the functions they deliver.

Gratuitous transfers:

1. Transfers (donations) from other budgets of the RF budget system
2. Subsidies from other budgets of the RF budget system (inter-budget subsidies)
3. Subventions from the RF federal budget
4. Inter-budget transfers from other budgets of the RF budget system
5. Gratuitous transfers from individuals and legal entities, international organizations, and foreign governments, including voluntary donations

*Budget expenditures* are money paid from the budget except for the resources to cover the budget deficit.

Expenditure obligations of the RF constituent result from the legislation and other regulations of the constituent and signature of contracts (agreements) by the public institutions of the RF constituent on behalf of the Russian Federation.

Regulation of subvention-associated federal budget spending by regions is indirect. No direct quantitative restrictions are imposed; nevertheless, if an RF constituent exceeds standards used for the calculation of relevant subventions, then it would have to mobilize its own revenues and deficit-funding sources to finance extra expenditures needed to execute the RF constituent's expenditure obligations in full.

The same approach works in the establishment of a regional budget deficit threshold. The RF Budget Code does not allow an RF constituent's budget deficit go above 15% of its approved annual budget revenues without consideration of approved amount of gratuitous transfers.

## Regional Inequality and Globalization

Alberto Posso
International Development and Trade Research Group, Royal Melbourne Institute of Technology, Melbourne, VIC, Australia

Does globalization, specifically trade, cause or reduce inequality in the developing world? In world governed by backlashes against globalization, this is a pressing question. Most economists argue that globalization is conducive to higher growth rates. However, it has become clear in recent times that not everyone benefits from trade liberalization. This debate has perhaps gained prominence in the international media following Brexit in the United Kingdom and the election of Donald Trump in the United States. However, this issue has been widely debated in developing nations for almost two decades. For example, since the late 1990s, Latin American politics has seen a decisive shift toward inward-oriented political leaders. Furthermore, in developing South East Asia, the traditional champion of globalization, there has been a growing rise in antitrade sentiments among some political groups,

particularly following the rise in income inequality in fast-growing economies, such as Vietnam and China. Therefore, understanding if globalization is associated with more or less inequality in the developing world will be important to help us determine the longevity of trade-oriented policies in the global south. This is, in turn, important given the large amount of empirical evidence from the economics literature that shows that globalisation, mainly international trade, is associated with higher rates of GDP per capita and GDP growth (Rodrik 2008).

The notion that trade or globalization can address development problems has been pushed forward by international development organizations, such as the World Bank and the International Monetary Fund for a number of years now. The proponents of the Washington Consensus (Williamson 1990) maintain that outward orientation is the most adequate approach to address pressing problems of development – poverty, unemployment, and inequality – in poorer nations.

Theoretically, this postulate is justified with the use of the application of the Heckscher-Ohlin-Stolper-Samuelson theorem to the experience of developing countries. The model suggests that developing nations have a relative abundance of unskilled workers, while the opposite is true in developed nations. The relative abundance of a labor-type, in turn, determines comparative advantage. That is, countries with many unskilled workers will be good at making products that require more unskilled than skilled labor. Therefore, in the aftermath of trade liberalization, developing nations will specialize in unskilled-labor intensive production.

In these nations, demand for unskilled workers will increase relative to demand for skilled labor. As a result, unskilled wages will rise, relative to their skilled counterpart. Given that unskilled wages are expected to be below skilled workers (because of a positive premium on education), trade liberalization in developing nations is likely to result in a decline in inequality. Importantly, the opposite forces are driving a wedge between skilled and unskilled wages in developed countries, which have a comparative advantage in skilled-labor intensive production. Overall, the theory dictates that globalization will decrease inequality in poor countries and increase inequality in rich ones. *This is the standard prediction of the Heckscher-Ohlin-Stolper-Samuelson Theorem*.

Within the developing world, the experiences of East Asian nations conform to this paradigm (Manning and Posso 2010). Economies such as South Korea, Taiwan, Singapore, Hong Kong, and Malaysia underwent significant improvements in wage inequality following trade liberalization policies.

Import-substitution-industrialization, a policy prescription borne out of the United Nation's Economic Commission for Latin America and the Caribbean, advised developing countries to cut themselves off to trade in order to manufacture high-value products generally imported from rich nations. Protectionism, however, resulted in a number of well-documented economic problems. First, closed economies were more likely to foment rent-seeking behavior by government officials, which decreases economic efficiency, added to the welfare loss of import restrictions, and fueled income inequality (Krueger 1978). Second, overvalued exchange rates and tariff restrictions discouraged exports and thus hurt employment prospects in developing countries (Little et al. 1970; Balassa and Associates 1971; Balassa 1998). Given that exports from developing nations are, by and large, unskilled labor intensive, protectionism became associated with lower employment opportunities of the unskilled, and rising inequality. Third, government intervention through subsidies to support domestic production resulted in insufficient incentives for innovation and widening budget deficits (Bruton 1998). Fiscal pressures limited the ability of states to invest in policies aiming at reducing inequities, such as education, health, and infrastructure. Overall, economies embracing protectionist policies, therefore, were found to be experiencing rising inequality.

In the late 1950s and early 1960s, Taiwan and Korea became aware of the constraints of maintaining small closed economies. Policymakers, therefore, started to gear their economies towards export-oriented growth, in order to expand demand for domestically produced goods, which were predominantly unskilled-labor intensive (Posso 2016). The experiences of these two economies, coupled with the already successful experiences of Hong Kong and Singapore, were seen as evidence that export-oriented growth was significantly more conducive to equitable growth than any other policy, including import substitution (Posso 2016). These economies experienced very high growth and declining inequality, pulling millions of people out of poverty in one generation. In fact, it is their success sparked a series of analytical reviews that both admired and tried to explain the "East Asian Miracle," perhaps heroically many of these reviews also started refereeing to these nations as the "East Asian Tigers" (World Bank 1993). Overall, the World Bank's review confirmed that the experiences of export-oriented developing economies adhere to the Heckscher-Ohlin-Stolper-Samuelson theorem – globalization resulted in high growth and lower inequality.

A number of authors built on this work by showing that these policies are only conducive to equitable growth when they are coupled with other initiatives. In particular, the supporting role of macroeconomic stability through conservative fiscal and monetary policies became widely acknowledged as a pillar of the reform agenda (Posso 2016). The broad consensus that emerged emphasized the importance of stabilization in the early stages of the process, with fiscal restraint and currency devaluation taking the leading role. As the macroeconomic environment became stabilized, the emphasis was to shift to structural adjustment, encompassing various microeconomic and institutional reforms (including trade reform) to remove inefficiencies and ensure adequate growth rates (Rodrik 1990). Indeed, some analysis argue that other nations were unable to replicate East Asian successes because macroeconomic reforms were not in place (Posso 2016).

Edwards (1993, 1995), for example, discusses the Chilean experience to underline the importance of complementary macroeconomic policies for the successful adoption of export-oriented growth. Chile was the first nation in Latin America to emulate the East Asian policy initiative and embark upon a process of export-oriented industrialization (Posso 2016). Following the military coup of 1973, the government of Chile began to liberalize domestic commodity markets and the financial market. By 1979 all items, but automobiles, had a nominal import tariff rate of 10%. As in East Asia, these changes resulted in an increase in total trade over GDP and real wages. However, unlike East Asia, the Chilean experiment occurred at a time of macroeconomic instability. In particular, Chile at the time suffered from hyperinflation and a large fiscal deficit (Corbo 2000).

Hyperinflation pressured the government to make the exchange rate the main anti-inflationary anchor, which resulted in a significant real appreciation. The latter, in turn, caused a major balance of payments crisis in 1982. In the period, the economy ran out of foreign reserves, it implemented a major devaluation, and various firms and banks went bankrupt (Posso 2016). Facing this budgetary crisis, the government backtracked on reform and raised the uniform tariff rate from 10% to 35%, leading to a fall of trade over GDP by 10% points between 1981 and 1982.

Other studies from around the world confirm that export-oriented success requires a good macroeconomic environment. In a World Bank study on liberalization episodes in nineteen countries, Michaely et al. (1991) conclude that "the fate of liberalisation policies appears to be clearly related to the conduct of macroeconomic policies" (p. 276). They highlight that expansionary fiscal policies were strongly associated with the abortion of outward-oriented policies, especially during the earlier stages of liberalization. Similarly, Rodrik (1995) argues that tariff and nontariff barriers to trade determine the openness of an economy, while the success of trade reform is determined by macroeconomic factors.

Therefore, for globalization to lower inequality, economies must also adopt macroeconomic

stabilization policies. There is a significant amount of empirical evidence showing that macroeconomic imprudence derailed much of the trade reform process, which in turn resulted in a significant backflip in a growing subsection of countries. It is in these nations, that the economic outcomes predicted by the Heckscher-Ohlin-Stolper-Samuelson model have not materialized.

Economic theory can explain this relationship. The net effect of expansionary fiscal policy coupled with trade liberalization will be a real exchange rate appreciation (Hatzipanayotou and Michael 1997). If the real exchange rate appreciates, export goods will become less competitive in the international economy. Therefore, a real exchange rate appreciation will decrease demand for unskilled labor within the export-oriented industry, thus lowering wages and employment in this sector. As alluded to above, this leads rising inequality in developing nations, which are moving away from the sector in which they have a comparative advantage in export markets.

This effect is magnified if fiscal expansion attract relatively more skilled labor, which is likely. Indeed, large bureaucracies can discriminate against unskilled labor in favor of more educated workers, which can reinforce inequality problems. Overall, these forces mitigate the Heckscher-Ohlin-Stolper-Samuelson effects within export-oriented industries in developing nations.

The complex nature of these relationships has perhaps muted the debate on the nexus between trade liberalization, fiscal expansion, and inequality in developing countries. Indeed, the process described above is often ignored in the media. Instead, fiscal prudence is often associated with austerity programs, which can curtail expenditure on social goods, such as education and health. However, economists, by and large, agree that expenditures on health and education are key to equitable economic growth (Ranis et al. 2000). Therefore, if equitable-growth driven by trade liberalization requires fiscal prudence, and if health and education reinforce equity within economies, the question ought to be not whether governments should spend more or less, but rather what sources of expenditure need to be curtailed in order to ensure the success and sustainability of liberalization policies.

Much of the theoretical and empirical literature in economics shows that trade liberalization, coupled with macroeconomic prudence, has the ability to lower wage inequality in the developing world. Ensuring the sustainability of these policies is paramount to the development process. Governments must continue to liberalize trade, while cutting expenditure on areas with lower social value.

# Regional Social Budgets, Russia

Elena Gorina
Institute for Social Policy, National Research University Higher School of Economics, Moscow, Russia

## Synonyms

Social spending; Social expenditure; Regional finance; Public spending; Regional social policy; Social public services

## Definition

Social budget is considered as public expenditure on education, health, culture, and social protection.

Regional budget (in Russia) is a subnational government consolidated budget consisting of constituent entity's budget and local (municipal) budgets. Budgets of constituent entities of the Russian Federation and local budgets are parts of the general government budget also composed of the federal budget and federal extrabudgetary funds (the pension fund, the social security fund, and the health insurance fund together with its regional divisions).

As a federal state, Russia has legislation separating competencies and powers within the hierarchy of public authorities of different levels. In the early and mid-2000s, Russia adopted federal framework laws which, firstly, streamlined the distribution of powers, obligations, and funds among the federal center and the authorities of the more than 80 constituent entities (regions) of the Russian Federation (RF) and secondly, defined local matters falling within the competence of municipal authorities (they are not part of the state power). The legislators introduced the concept of subsidiarity in the form of the "best level" principle meaning that responsibility for the provision of a public service rests with the authorities at the lowest level of the authority's hierarchy capable of duly performing this duty. The legislators also set the mechanism of assuming obligations whereby only those authorities that directly set budget obligations can and must fund them using revenues at their disposal.

Generally, subnational government spending, including social one, is the sum of expenditures to fund the region's obligations, expenditures (via fund transfers) to fund obligations delegated from the federal level, and expenditures on local public goods at the municipal level.

## The Composition of Regional Social Spending

In the existing system of distribution of powers, both regional and local authorities are responsible for a wide range of social services and programs. This is in keeping with the practices of many developed nations, especially federal states.

The federal laws 184/1999 and 131/2003 as amended assign to subnational governments a set of expenditure responsibilities in the social sector. These are:

- Providing early childhood care, preschool, primary, secondary, and afterschool education
- Providing vocational education and training
- Organizing recreation for children in summer camps
- Projects in the field of youth
- Running orphanages, providing adoption and fostering

- Providing welfare services to senior citizens and persons with disabilities
- Paying allowances to families with children, low-income households (for example, for housing and utilities)
- Maintaining regional and municipal public libraries, museums, and theatres
- Protecting and maintaining objects of cultural and historical heritage
- Organizing emergency and primary medical care, providing health care in specialized hospitals
- Providing medical insurance for the unemployed, children, and senior citizens

The items of regional social spending include the following:

- Routine maintenance of institutions (kindergartens, schools, nursing homes, libraries, and so on) to ensure their smooth functioning and, accordingly, to guarantee access for the public to services they provide, to such an extent and according to such standards as set forth in laws and regulations
- Payment of salaries to employees
- Rehabilitation of buildings and infrastructure, construction of new buildings and infrastructure
- Payment of welfare benefits and subsidies to different categories of people
- Organization of social initiatives, cultural, and sports events
- Fund transfers to local budgets for current expenses and social projects (in case regional authorities delegate some of their powers to local authorities)

So, the competencies of regional and local authorities in Russia cover a variety of essential issues related to the formation and development of human capital.

## The Role of Regional Budgets in Public Social Spending in Russia

Nearly one-third of overall public social expenditures (including transfers to fund federal obligations) are channeled via regional budgets.

Regional budgets are responsible for the bulk of financing in education and culture (Fig. 1).

**Regional Social Budgets, Russia, Fig. 1** Subnational governments account for about 11–82% of general government budget social expenditures (at the cost of regional revenues only, excluding special purpose federal transfers)

Over the last 5 years, the center of gravity has shifted even further: the share of subnational funds in education grew from 76% to 81%, and in culture, from 74% to 82%. This shift was in large measure promoted by the federal authorities' decision to significantly increase public employees' salaries (more about this later). Local budgets, too, play an important role in the funding of these spheres: thus, in many regions, cultural and educational institutions are in the responsibility of municipal and not regional authorities.

The regional health care funding has a fairly complicated structure. All medical services guaranteed to the population under the "free" public health care program are financed from the mandatory health insurance funds (the single-source financing scheme). The regional budgets in their turn are responsible for providing health care in specialized hospitals (for tuberculosis, cancer, psychiatric conditions, and so on). They also finance those health care projects that are either unrelated to the medical service provision per se (for instance, blood donation or food safety and disease control and prevention) or related to the development of health care sector (upgrading, building and equipping medical facilities, introduction of innovative methods in medicine, human resources, etc.).

With the introduction of the single-source scheme, public funds account for only about one-half of Russia's health care expenditures, and most of these funds are regional too. Regions spend on health thrice as much as the federal center, whose contribution to the funding of this sector is declining in absolute terms.

The system of social protection, which includes a pay-as-you-go pension system, is financed mostly from the state insurance funds (the pension fund and the social security fund) and the federal budget. The gross spending of these funds and the federal budget (which includes pensions, benefits for the disabled and veterans, maternal and parental leave allowances, sick and temporarily disability and unemployment allowances, etc.) has been growing faster than the regional expenditures on welfare benefits. For this reason, by 2017, the regional budgets' contribution went down to 11%, although it is precisely regional authorities who are responsible for all welfare assistance to low-income households, social care for elderly and the disabled, as well as for many kinds of assistance for families with children and senior citizens.

## Social Burden of Regional Budgets

In Russia, public social spending accounts for about 20% of the GDP. Comparing only the sum of those budget items that are considered in the statistics of the Organisation for Economic Co-operation and Development (OECD) (that is minus expenditures on culture and all levels of education save early childhood education and care), this share is even lower – 16.9% of the GDP. In the OECD member states, the share of social spending in GDP (about 21%) was reached the historical maximum in 2016.

Social expenditures account for 57–59% of the regions' overall expenditures. Education accounts for the largest segment (25% on the average), health and social protection account for 13–15%, and culture, for less than 4%.

But these average values do not reflect variations among the regions. Thus, every third region spends on education more than 30% of its budget, and about one-third of the regions spend more than 15% of their budgets on health. There are also large variations in social protection expenditures: in 6 constituent entities, their share is less than 10% and in 16 – more than 18% (Fig. 2).

In general, the regions with a lower than average share of social expenditures are either regions with the highest revenues (Moscow and oil producing regions) or the Far North regions, with their higher-than-average spending on the maintenance of public utilities. And most of the economically weak regions, in contrast, carry the greatest burden of social spending. On the one hand, they do not have enough funds for other budget items, and on the other, they usually have a higher-than-average share of dependent population groups, such as elderly and children, which increases demand for social services and assistance.

**Regional Social Budgets, Russia, Fig. 2** Russia's regions differ considerably on the share of social spending in total regional budget expenditures, 2017

## Some Problems of Regional Social Spending in Russia

In order to better understand the Russian specifics of public social spending at regional level, several thorny issues need to be addressed.

Firstly, the characteristics of regional social spending are affected by the way how fiscal capacity and expenditure obligations are distributed among the different levels of public authorities. One of the problems is related to the fact that in the Russian system of budgetary federalism, the last 10–15 years have witnessed a growing discrepancy between the centralization of fiscal powers and the decentralization of public spending.

Some decisions made by the federal authorities at that period significantly affected the volume of social obligations borne by the regions. For instance, the reform of intergovernmental finance in the mid-2000s delegated to regional authorities significant social spending obligations without a matching increase in fiscal capacity. One of the critical decisions was adopted in 2012: President in his decrees set the goal to considerably increase salaries for doctors, teachers, social workers, scholars, and other public employees in the course of 2–6 years. Almost the entire financial burden of fulfilling "the salary decrees" has been borne by the subnational government since between 85% and 99% of public employees work in organizations owned by the regions or municipalities. However, contrary to the provisions of Russia's Budget Code, the new budget obligations were not accompanied with new sources of revenue for their financing. The federal transfers compensated the regions only for a small part of the expenses necessary to fulfill the decrees. Considering that the period under discussion saw the increase in budget constraints, many regions have been compelled to channel some of the funds previously earmarked for other budget items into the new priority items and to borrow actively (World Bank 2016).

Seriously affected by these developments, in 2012–2017, the dynamics of regional social spending became saltatory. So, having ensured a salary hike for teachers within 2 years, later the regions have been holding in check the growth of educational expenditures and many regions even reduced them in nominal terms. The same happened to cultural expenditures. The peak of the policy of cuts fell on 2015–2016, followed by a gradual return to the normalcy.

The situation with social protection and health care looks better. As for expenditures on cash and in-kind benefits, regional authorities on most occasions have been treading more softly: the

issue is both socially sensitive and important from the electoral perspective. Yet, some regions were reducing social protection expenditures, mostly by force of circumstances, because of large budget deficits and debt loads. In 2017, the number of regions facing these challenges grew. But it does not appear as if this tendency is going to stay. Considering that halving the poverty rate is a proclaimed national goal of the social policy until 2024, it is very likely that regional authorities will have to correct their restrictive policies in the area of social assistance and seek additional funds for the development of targeted programs to support low-income groups.

Another important issue is a territorial aspect of social justice. It is of great relevance in Russia as a country with a high degree of socioeconomic heterogeneity. Although two-thirds of Russia's regions are more or less similar to each other in terms of economic development and fiscal sustainability, regions in the remaining one-third differ greatly with respect to their GDP, fiscal capacity, population's incomes, etc. (World Bank 2017).

The federal center's equalization policy reduces social disparities among the regions: the center redistributes among them a large portion of the revenues (about 2% of GDP), and in the most economically weak regions, federal transfers account for 70–80% of subnational revenues. However, significant disparities among regions in terms of social spending persist, and this provokes inequality in terms of availability and quality of social services.

A good case in point is variations among the regions with regard to the levels of per capita public spending on secondary school students. The gap between the average values of this indicator in the top 10 and the bottom 10 regions is as high as 2.5. This attests to the fact that children from economically disadvantaged regions have far poorer chances to receive high-quality secondary education.

In terms of decision-making freedom accorded to regional authorities, social protection is perhaps the best among all social spheres. This circumstance gives rise diversity of approaches to the social assistance provision (kinds and amounts of benefits, conditions of their provision), and, as a consequence, variations not only in the percentages of public spending but also in the results of social programs (for instance, with regard to poverty).

The issue of effectiveness of social spending deserves consideration as well. Presently, in Russia, evaluation of effectiveness of public expenditures is an element of result-based management: it is carried out as a part of the evaluation of public programs performance, including at regional level. Ongoing monitoring is the competency of the same authorities that are responsible for planning and carrying out these programs, so the evaluation of effectiveness often amounts to nothing more than a mere formality.

It is usually only academic researchers (e.g., Akhremenko 2013; Nazarov and Pošarac 2017) who evaluate social expenditures efficiency and effectiveness comparing resources, outputs, and outcomes. Certain areas of regional social spending were subject to such evaluation. Thus, DEA-based comparative evaluation of effectiveness of social protection spending (Tumaniants and Sesina 2017) showed that the social policies of Russia's regions are mostly extensive, and regions differ strongly from one another in terms of effectiveness. The lowest effectiveness ratings (in terms of "input-output") in the sphere of social assistance were given to the least economically developed and the most economically developed regions. The former do not have enough public funds available and can finance only a minimum of obligations which have but a small effect on the poverty rates. The latter, meanwhile, perhaps do not have enough incentives to increase the cost-to-benefit ratio of public expenditures. The most efficient social protection expenditures were found in regions with the average level of socioeconomic development: they have both the motivation and the capacity for ensuring a more optimal system of social assistance.

# Regression Analysis

Farid Makhlouf
Finance, Pau Business School, Pau, France

## Synonyms

Cross-sectional data regression; Linear regression; Multiple regression; Panel data regression; Simple regression; Time series regression

## Definition

Regression analysis refers to methods, techniques, and processes for studying the relationship between a dependent variable and the explanatory variables.

## Introduction: What Is Regression Analysis?

Financial, managerial, marketing, and economic decisions are usually established based on the relationship between two or more variables. Regression analysis can be used to show how these variables relate to each other. Regression analysis can also be used to improve understanding the phenomenon, test theories in social sciences, and investigate hypotheses. Regression analysis is an essential research tool in social sciences. It can be classified into two fields: micro-econometric and macro-econometric. Micro-econometric is applied to individual data, whereas macro-econometric is applied to aggregate data. The variable being predicted or studied has many synonyms: the dependent, explained, endogenous, regress and, predict and, outcome, response, and controlled variable. It is often denoted by ($y$). The variables used to explain the dependent variable are called the repressors, independent, explanatory, predictors, regressors, covariates, and stimulus variables. They are often denoted by ($X$).

The function that describes how the dependent variable is related to a number of possible explanatory variables and an error term is referred to as the regression model. Two main models widely used in regression analysis are simple and multiple linear regression models. The simple regression analysis takes into account only two variables (dependent and independent). In other words the dependent variable is explained by only one variable and other unobservable factors which are represented by error term. However, the multiple regression analysis considers more than one independent variable.

When the dependent variable assumes two discrete values, the ordinary multiple regression is no longer valid; logistic regression is more appropriate. Logistic regression requires a dependent variable and (k) independent variables. Regardless of the nature of the dependent variable, the regression model can be written as follows:

$$y = f(X_1, \ldots, X_k, \varepsilon) \quad (1)$$

where

$y$: dependent variable. $y$ represents the response variable.

$X_1, \ldots, X_k$: are $k$ independent variables with $k \in \mathbb{N}*$. Independent variables assumed to be non-stochastic and independent of each other. These variables are supposed to explain y. The relationship between dependent

R

variables and covariates can be motivated and driven from theory or hypothesis.

$\mathcal{E}$: The error term $\mathcal{E}$ is assumed to be independent and identically distributed. The error term is also assumed to be random having normal distribution with a mean equal to zero and constant variance ($\sigma^2$).

$f$: is the function defining and expressing the relationship between explanatory variables and the dependent variable. In other words, $f$ explains how the independent variables are related to the dependent variable. It can be parametric or nonparametric, linear or nonlinear.

Regression analysis also uses data to test and study the nature of relationships between variables. The main objectives of regression analysis intend to:

1. Test theories in economics and management which provide information and evidence on the process that determines the evolution of phenomena; regression analysis provides empirical verification and/or validation.
2. Evaluate the effectiveness of public actions and social programs.
3. Forecast and predict the evolution of economic and financial variables such as public spending, financial indices, exchange and interest rates, inflation, etc.
4. Assess selected company policies.

In regression analysis the researcher or the modeler should take into account:

1. The function to be used that connects the explanatory variables to the dependent variable (which is usually linear) such as

$$y = \beta_1 + \beta_1 \times X_1 + \beta_2 X_2 + \ldots \beta_k \times X_k + \mathcal{E} \quad (2)$$

2. The method used in estimation of the parameters associated with the model
3. Statistical tests for the quality of the coefficients and residuals
4. Indicators of the quality of the model

The rest of this chapter is organized as follows:

Section "Building Model" describes econometric models and steps required to build those models.

Section "Data Structure and Regression Analysis" treats the relationship between data structure and regression analysis.

Section "Hypotheses in Regression Analysis" discusses hypotheses in regression analysis.

Section "Estimation in Regression Analysis" discusses estimation and interpretation of results in regression analysis by taking two examples, the first in simple regression and the second in multiple regression.

Section "Conclusion" concludes this chapter.

## Building Model

### Definition

The model can be defined as partial presentation of the reality. In econometrics this representation of the reality can often be carried out simply, by equations. The main objective of the model to understand the behavior of variables and to make informed predictions. To construct a model in econometrics, the following steps are required: theoretical reference, formalization of relationships between variables, measurement of variables, and estimations. As stated in the introduction, regression analysis aims to estimate the nature of the relationship between economic and social variables, etc. The first step is particularly important to specify the model to be estimated. The model can be derived from a theory or a hypothesis concerning the existence of a relationship between two or more variables. Supposing a government asks for an assessment of the impact of an education policy on student performance, in other words the effectiveness of education policies; in this case the appropriate model can be written as follows:

$$y = f(X_1, X_2, X_3, ..X_k) \quad (3)$$

$y$ the student performance can be measured by the final result at the end of year and $X_1, X_2, X_3, \ldots X_k$ are the potential determinants of performance such as public spending in education, income and education level of parents, teacher quality, geographical location, etc. It is true that other unobservable variables can also influence student success such as academic ability, illness, or any other unpredicted events (represented in the regression equation as $\varepsilon$). Assuming that the relation is linear in parameters, the model can be written as follows:

$$y = \alpha_0 + \alpha_1 X_1 + \alpha_2 X_2 + \ldots + \alpha_k X_k + \varepsilon \quad (4)$$

In Model 4 there are $k$ explanatory variables of student performance and ε contains unobservable variables. The parameters ($\alpha_0$, $\alpha_1$, $\alpha_2$, …, $\alpha_k$) are unknown, identified as the regression coefficients. $\varepsilon$ is the error term and can also represent the unobservable random variable. The main question in the regression analysis is how to estimate the parameters ($\alpha_0$, $\alpha_1$, $\alpha_2$, …, $\alpha_k$). To answer this some assumptions must be stated (see section "Hypotheses in Regression Analysis").

The error term arises because the relationship between y and the explanatory variables is a simplification of reality. In regression analysis it is essential to distinguish between the error term and the residual. The residual is the estimation of the error term noted $\widehat{\varepsilon}$ (see section "Estimation in Regression Analysis").

The main idea proposed in the regression analysis is to minimize the sum squared error ($\varepsilon^2$). The parameters ($\widehat{\alpha}_0, \widehat{\alpha}_1, \widehat{\alpha}_2 \ldots, \widehat{\alpha}_k$) are estimators of the parameters of Model 4. The estimated model can be written as follows:

$$\widehat{y} = \widehat{\alpha}_0 + \widehat{\alpha}_1 X_1 + \widehat{\alpha}_1 X_2 + \ldots + \widehat{\alpha}_1 X_k \quad (5)$$

The difference between the observed and the estimated performance is the residuals noted $\widehat{\varepsilon}$. The most known and used technique is OLS.

## Steps to Building Model

1. Theoretical references and investigations: in this first step, the theory or hypotheses are established.
2. Regression model (specification): the mathematical model of the theory is stated and the relationship between variables is established.
3. Measurement of variables (data collection): the specific data collected will be used in the regression analysis and are referred to as the data set.
4. Estimation (estimated regression equation): once data has been collected, the equation parameters can be estimated.
5. Results analysis: is the model statistically correct?

   Yes: if the fitted model is good (approximation to the reality), the final step can begin. This is the interpretation of the model and its applications.

   No: new specifications or new data as required.

## Notations in Regression Analysis

Regression model: $y = \alpha_0 + \alpha_1 X_1 + \ldots + \alpha_k X_k + \varepsilon$.

Regression equation: $E(y \backslash X_1, \ldots, X_k) = \alpha_0 + \alpha_1 X_1 + \ldots + \alpha_k X_k$ with $E(y)$ is the expected value of y given the explanatory variables.

Estimated regression equation: $y = \widehat{\alpha}_0 + \widehat{\alpha}_1 x_1 + \ldots + \widehat{\alpha}_k x_k$.

$\varepsilon$ errors: can be caused and amplified by misspecification, poor measurements of variables, or omission of pertinent variables.

$\widehat{\varepsilon}$: residual.

## Linear Function vs Nonlinear Function

In the theoretical model, the nature of the relationship may or may not be linear. In the regression model, transformation of variables can often be performed in order to use a linear framework. In most cases the logarithmic transformation of independent and dependent variables is used in a regression model to linearize the relationship between dependent variable and explanatory variables, for example, estimating the Cobb-Douglas production function: $y = f(A, K, l) = AK^{\alpha}L^{\beta}$ where A is the technology and $K$ and $L$ are production factors, namely, capital and labor, respectively. The regression model can be written as $\log(y) = \log(A) + \alpha \log(K) + \beta \log(L) + \varepsilon$. The parameters $\alpha$ *and* $\beta$ are considered as elasticity of the production

with respect to capital and labor, respectively. Table 1 gives logarithmic transformation and interpretations of the regression parameters.

### Single-Equation Model Versus Multi-equation Model

In the single-equation model, the dependent variable is explained by one function. However, in the multi-equation model, at least two functions must be applied at the same time despite the number of variables, for example, in the case of two endogenous variables ($y$ and $x$):

$$\begin{cases} y = f(x,\ Z) \\ x = g(y,\ Z) \end{cases}$$

where $f$ and $g$ are functions and $Z$ is the exogenous variable.

### Interaction Between Variables

In regression analysis the join effect of two variables on the dependent variable can be studied. For example, the effect of $X$ an $Z$ on $y$ can be modeled as the following:

$$y = \alpha_0 + \alpha_1 X + \alpha_2 X + \alpha_3 (XZ) + \varepsilon.$$

$\alpha_3$ can account for the potential effect of $X$ and $Z$ acting together on $y$.

### How Many Explanatory Variables Should Be Used in Regression Analysis?

Without any theoretical reference, the regression analysis can investigate the relationship between variables. To test whether the addition or deletion of a new variable to a model is pertinent or not in regression analysis, a $F$ test is used (for more details, see Greene 2000). This test is based on the variation of the error resulting from adding or deleting variables. The test will validate the addition or deletion of variables. In the regression analysis, there are techniques that enable the selection of explanatory variables such as forward regression and stepwise regression.

### Data Structure and Regression Analysis

The main objective of this section is to summarize the link between data structure and regression analysis. The regression that is appropriate depends on whether the data for the dependent variable are categorical or quantitative (for more details, see Anderson et al. 2014). Figure 1 summarizes the nature of dependent variables.

The nature of the dependent variable (qualitative or quantitative) will condition the technique to be used in the regression analysis. In other words, it is important to know the structure of the data to be used in the regression in order to propose the appropriate technique. There

**Regression Analysis, Table 1** Variable transformations

| Model ($\log(1) = 0$; $\log(X^A) = A \times \log(X)$; $\log(X \times Z) = \log(X) + \log(Z)$; $\log(X \div Z) = \log(X) - \log(Z)$; $\log(e) = 1$; $e = 2.718282$) | y = f(X) | | Interpretation |
|---|---|---|---|
| Log–log | Log (y) | Log (X) | Percentage change in $Y$ *affected* by percentage change in $X$ (Elasticity $= \frac{\frac{\Delta y}{y}}{\frac{\Delta x}{x}}$) |
| Log–linear | Log (y) | X | Percentage change in $Y$ when $X$ increases by one unit |
| Linear–log | y | Log (X) | Change in $Y$ as $X$ increases by % |
| Linear | y | X | Change in $Y$ when $X$ increases by one unit |

**Regression Analysis, Fig. 1** Dependent variable

are three types of data: time series data, cross-sectional data, and panel data (longitudinal data).

### Time Series Data

Data collected over a time interval are known as time series data such as stock price, sales, inflation, etc. Data are generally noted with a time index ($X_t$) where "t" is time; it can be years, semesters, months, days, hours, etc. In this case regression analysis refers to time series regression. The model with "k" explanatory variables can be written as follows:

$$y_t = f\left(X_t^1, \ldots, X_t^k, \varepsilon_t\right) \tag{6}$$

where
t: time.
$y_t$: dependent variable taking values over a specific time period
$X_t^1, \ldots, X_t^k$: explanatory variables
$\varepsilon_t$: errors

Regression analysis can explain and predict the behavior of the dependent variable over time. Regression analysis is commonly applied for modeling and forecasting of economic, financial indicators. In some cases, when the dependent variable is explained only by its past, the appropriate model is autoregressive as follows:

$$y_t = \alpha_0 + \alpha_1 y_{t-1} + \alpha_2 y_{t-2} + \ldots + \alpha_2 y_{t-h} + \varepsilon_t \tag{7}$$

with $h \in \mathbb{N}*$ and $h < t$. The number of observations is equal to $T$.

### Cross-Sectional Data

Cross-sectional data are collected from a sample of individuals such as firms, household, states, countries, etc. at the same moment in time. Cross-sectional data are usually noted as ($X_i$) $i = 1, 2, \ldots, N$ with $N$ equal to sample size. In this case, regression analysis refers to cross-sectional data regressions. The model can be written as follows:

$$y_i = f\left(X_i^1, \ldots, X_i^k, \varepsilon_i\right) \tag{8}$$

where
i = {1, 2, . . ., N}: individuals
$y_i$: dependent variable that takes its values over individuals
$X_i^1, \ldots, X_i^k$,: explanatory variables
$\varepsilon_i$: errors
The number of observations is equal to $N$.

### Panel Data

Data which have both time series and cross-sectional features are called panel data. For example, ten company surveys were carried out from 2010 to 2017. The advantage of panel data is that they take into account the individual and the temporal effect. This also makes it possible to consider the heterogeneity of individuals.

Two main models can be studied under panel data: random effects model and fixed effect model. Two types of panel data exist: balanced panel, in which case each individual has the same number of observations, or unbalanced panel in which case the number of observations varies between individuals. Panel data are presented with two indices as follows: $X_{it}$. The number of observations= N × T. The model with k explanatory variables can be written as follows:

$$y_{it} = f\left(x_{it}^1, \ldots, x_{it}^k, \varepsilon_{it}\right) \tag{9}$$

where
$i$: individuals
$t$: time
$k$: the number of explanatory variables
$y_{it}$: dependent variable that takes its values over individuals and time
$x_{it}^1, \ldots, x_{it}^k$: explanatory variables
$\varepsilon_{it}$: errors that can be split into two component errors, from time and individuals

## Hypotheses in Regression Analysis

In regression analysis some assumptions are required in order to better fit the dependent variable. Suppose the following model in Eq. 10 needs to be estimated:

$$y_i = f\left(X_i^1, \ldots, X_i^k, \varepsilon_i\right) \tag{10}$$

The model presented in Eq. 10 means that k explanatory variables can explain or determine $y$, either by hypothesis or by theory. To find how these explanatory variables influence y, the following assumptions are essential:

1. The relationship between dependent variable and explanatory variables is linear. This assumption enables Model (10) to be written as follows:

$$y_i = \alpha_0 + \alpha_1 X_i^1 + \ldots + \alpha_k X_i^k + \varepsilon \tag{11}$$

2. Explanatory variables are not stochastic (random).
3. $E(\varepsilon \setminus x_1, \ldots, x_k) = 0$: Explanatory variables are exogenous; in other terms the expected value of errors given explanatory variables is equal to zero.
4. Homoscedasticity: $variance(\varepsilon = \sigma^2)$ the variance of errors is constant.
5. $E(\varepsilon) = 0$: The expected value of the error term is equal to zero.
6. $covariance\left(\varepsilon, \overset{\cdot}{\varepsilon}\right) = 0 \; for \; all \; \varepsilon \neq \overset{\cdot}{\varepsilon}$ . Errors are independent.
7. Normality: $\varepsilon \sim \mathcal{N}(0, \sigma^2 \mathrm{I})$. Errors are normally distributed. Figure 2 gives the normal distribution.

The least-squares parameters vary according to the sample taken. Thus parameter equation $(\widehat{\alpha}_0, \ldots, \widehat{\alpha}_k)$ can be considered as a random variable. Through assumptions Eqs. 1–7, the parameters $(\widehat{\alpha}_0, \ldots, \widehat{\alpha}_k)$ are BLUE (best linear unbiased estimators) which means that:

**Regression Analysis, Fig. 2** Normal curve

**Best**: the estimators are efficient because they have a minimal variance compared with other unbiased estimators.

**Linear**: the estimator is linear since the estimators can be written as a weighted mean of the dependent variable.

**Unbiased**: means that expectation of the estimated parameters is equal to the true parameter. For example, in average $\widehat{\alpha}_0 = \alpha_0$; in other terms $E\left(\widehat{\Theta}\right) = \Theta$ with $\widehat{\Theta} = \{\widehat{\alpha}_0, \ldots, \widehat{\alpha}_k\}$and $\Theta = \{\alpha_0, \ldots, \alpha_k\}$.

## Estimation in Regression Analysis

An estimator is a method that allows the estimation of unknown parameters. The estimation is a numerical value provided by an estimator. There are several estimation techniques used in regression analysis, namely, ordinary least square (OLS), generalized method of moments (GMM), maximum likelihood (ML), quasi-maximum likelihood (QML), nonparametric (NP), etc. This subsection describes two main estimations in analysis regression, i.e., simple regression and multiple regression using the OLS estimation. The linear regression with OLS estimation is the most and widely used technique in regression analysis.

### Simple Regression

In simple regression one explanatory variable is used to explain and/or predict the dependent variable projected by a straight line. Taking an example of two variables ($X$ and $y$) $X = \{1; 2; 3; 4; 5\}$ and $y = \{4; 3; 7; 8; 11\}$, the set of observations $(X, y)$ is called the sample. The relationship between $X$ and $y$ is assumed to be linear so the model can be written as follows:

$$y = \alpha_0 + \alpha_1 X + \varepsilon. \tag{12}$$

The variable $\varepsilon$ can reflect the unobservable factors that influence $y$. Figure 3 shows the scatter plot between the dependent variable $y$ which is explained by one explanatory variable $X$. The estimated regression can be expressed:

$$\widehat{y} = \widehat{\alpha}_0 + \widehat{\alpha}_1 x. \tag{13}$$

The main idea is to explain the variation of $y$ by $X$. Geometrically, Eq. 13 is a line; see Fig. 3. Applying the OLS technique provides the best line and the least-squares estimators $(\widehat{\alpha}_0, \widehat{\alpha}_1)$ which minimize the sum of the squared residuals. This idea can be translated mathematically by this criterion:

$$\text{Minimize} \sum (y - \widehat{y})^2. \tag{14}$$

$\widehat{y}$ is called the predicted or fitted value and $y$ is called the observed value. Condition 14 can be written as follows by replacing $\widehat{y}$

$$\text{Minimize} \sum (y - \widehat{\alpha}_0 + \widehat{\alpha}_1 x)^2 \tag{15}$$

The aim is to find $\widehat{\alpha}_0, \widehat{\alpha}_1$ which minimize the expression (15). Several software packages (R, STATA, SAS, Eviews, SPSS, Gmulti, Gretl, Excel, etc.) can directly calculate the parameters that satisfy the expression (15). Analytically (for more details, see Wooldridge 2009) $\widehat{\alpha}_0, \widehat{\alpha}_1$ can be calculated by using these formulae: $\widehat{\alpha}_1 = \frac{\text{cov}(X, y)}{\text{var}(x)}$ ; $\widehat{\alpha}_0 = \text{mean}(y) - \widehat{\alpha}_1 \times \text{mean}(x)$ . The result of the equation above is given in Fig. 3 and Table 2.

Table 2 shows the relationship between the observed dependent variable and the fitted or predicted dependent variable. Table 2 clearly shows that the observed value is equal to fitted value plus the residual value.

**Regression Analysis, Fig. 3** y: Dependent variable; x: Explanatory variable

## Multiple Regression

Multiple regression analysis involves more than one explanatory variable in addition to the constant term or intercept. Now, suppose that the dependent variable $y$ studied in simple regression is influenced not only by $X$ but also by a new variable $Z = \{2; 4; 3; 6; 5\}$. In this case the model investigating the impact of $X$ and $Z$ on $y$ requires a multiple regression framework. The model can be written as the following:

$$y = \alpha_0 + \alpha_1 X + \alpha_2 Z + \varepsilon. \tag{16}$$

In the multiple regression, $k$ variables can be added under the following condition: the number of explanatory variables must be less than the number of observations. In Eq. 16, $\alpha_0$ is the intercept, and $\alpha_1$, $\alpha_2$ are the partial effects for each variable, $X$ and $Z$, respectively. Under the same assumptions as for the simple regression using the same criterion (minimizing squared errors) $\alpha_0$, $\alpha_1$, $\alpha_2$ can be estimated by using OLS technique. The estimated model can be written as the following:

$$Y = \widehat{\alpha}_0 + \widehat{\alpha}_1 X + \widehat{\alpha}_2 Z \tag{17}$$

by using the matrix form, the Eq. 17 can be written as the following:

$$y = M\widehat{\theta} \tag{18}$$

where $M = \begin{bmatrix} CXZ \\ 112 \\ 1\ 2\ 4 \\ 1\ \ 3\ \ 3 \\ 1\ \ 4\ \ 6 \\ 1\ \ 5\ \ 5 \end{bmatrix}$ is a matrix of explanatory variables. $C$ is a constant included in the first column, and $\widehat{\theta} = \begin{bmatrix} \widehat{\alpha}_0 \\ \widehat{\alpha}_1 \\ \widehat{\alpha}_2 \end{bmatrix}$ are the parameters of the Eq. 18. The equation parameters can be obtained by the following formula (for demonstration, see Wooldridge):

**Regression Analysis, Table 2** Fitted value and observed value

| X explanatory variable | Y (observed value ) dependent variable | $\widehat{y} = \widehat{\alpha}_0 + \widehat{\alpha}_1 x$ Fitted value (estimated value) | $\widehat{u} = y - \widehat{y}$ Residual |
|---|---|---|---|
| 1 | 4 | $2.8 = \mathbf{0.9} + \mathbf{1.9} \times 1$ | $1.2 = 4–2.8$ |
| 2 | 3 | $4.7 = \mathbf{0.9} + \mathbf{1.9} \times 2$ | $-1.7 = 3–4.7$ |
| 3 | 7 | $6.6 = \mathbf{0.9} + \mathbf{1.9} \times 3$ | $0.4 = 7–6.6$ |
| 4 | 8 | $8.5 = \mathbf{0.9} + \mathbf{1.9} \times 4$ | $-0.5 = 8–8.5$ |
| 5 | 11 | $10.4 = \mathbf{0.9} + \mathbf{1.9} \times 5$ | $0.6 = 11–10.4$ |
| Mean($X$) = 3 | Mean($y$) = 6.6 | | mean($\widehat{u}$) = 0 |
| Variance($X$) = 2 | Covaraince(X, y) = 3.8 | | |
| $\widehat{\alpha}_1 = \frac{\text{cov}(X,\ y)}{\text{var}(x)}; \widehat{\alpha}_0 = \text{mean}(y) - \widehat{\alpha}_1 \times \text{mean}(x)$ | | | |

**Regression Analysis, Table 3** Regression output (results obtained by using data in Table 4 are given in appendix and function "lm" in **R** software. Code is given in appendix)

```
Coefficients:
            Estimate Std. Error t value Pr(>|t|)
(Intercept)   2.3222     1.4292   1.625    0.246
X             2.6111     0.5597   4.665    0.043 *
Z            -0.8889     0.5597  -1.588    0.253
---
Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1

Residual standard error: 1.062 on 2 degrees of freedom
Multiple R-squared:  0.9453,    Adjusted R-squared:  0.8905
F-statistic: 17.27 on 2 and 2 DF,  p-value: 0.05475
```

First column: the parameters (constant or intercept and the values of $\widehat{\alpha}_1$ and the $\widehat{\alpha}_2$)
Second column: the standard errors for each parameter
Third column: the value of T test
Fourth column: the p-value (probability value) which indicates if the variable is significant or not. The p-value provides information for the relevant decision to be taken relative to the test of hypothesis: $\begin{cases} H_0 : \text{X is not significant and equal to zero} \\ H_a : \text{X is different from zero} \end{cases}$

$$\widehat{\theta} = (X^t X)^{-1} X^t y. \tag{19}$$

The results of the model (Eq. 17) are given in Table 3.

## Regression Diagnostic

In general if the P-value associated to a given explanatory variable is lower than 5%, the explanatory variable significantly impacts the dependent variable. The value of 5% is chosen by the searcher; it can be more or less. Sometimes the p-value can be 10%. Certain statistical software accord stars (*) if the result is significant which provide additional support (see Table 3 signif. codes).

**Regression Analysis, Table 4** Data used in regression

| x | z | y |
|---|---|---|
| 1 | 2 | 4 |
| 2 | 4 | 3 |
| 3 | 3 | 7 |
| 4 | 6 | 8 |
| 5 | 5 | 11 |

To understand the p-value better, the following interpretations will clarify the procedure:

The $p$-value associated to variable (X) is equal to 4.3%, i.e., less than 5%. In this case the variable (X) has a positive and significant impact on the dependent variable (y). However, the p-value associated with variable (z) is equal to 25.3%. In this case the variable does not explain the dependent variable (y). In other words it has no significant impact on y.

### Goodness of Fit in Regression Analysis

In regression analysis residuals measure the difference between fitted values and the observed values of dependent variable $(y - \hat{y})$. A good quality of adjustment in regression analysis means that a large proportion of the variance of the dependent variable is explained by the model or by the explanatory variables. Otherwise, the proportion of the dependent variable that is not explained must be small. In other words the residuals variance should be close to zero.

In the linear regression, the main indicator used is the R-squared $R^2$ or the adjusted R-squared $(\overline{R}^2)$. The R-squared is equal to regression sum of squares divided by total sum of squares (for more details, see Wooldridge 2009). The $R^2$ can be calculated as follows: variance $(\hat{y})/\text{variance}(y)$. The R-squared ranges in value between 0 and 1. When R-squared closes to 0, it means that the quality of the regression is bad; in other terms the model used cannot explain the variation of the dependent variable. Conversely, R-squared closes to 1 may reflect a good quality of adjustment of the model. In Table 3 the adjusted R-squared is equal to 89%, which means the roughly 90% of the variations on y is explained by the model used.

### Issues in Regression Analysis

In regression analysis, the researcher must pay attention to certain problems that can occur and compromise the quality of the regression leading to inappropriate conclusions. In other words, a violation of one or more of assumptions presented in section "Hypotheses in Regression Analysis" leads to the false conclusion. Problems that can lead to false conclusions are the following:

Misspecification due to an omission of one or more relevant explanatory variables in the regression model.

Nonlinear relations: If the real relationship is not linear, the results of the regression can be far from the reality.

Outliers: The presence of outliers in data used in regression changes significantly the regression coefficients.

Multicollinearity: Two or more explanatory variable are highly correlated.

The variance of residual is not constant.

Residual values are autocorrelated.

Residues do not follow normal curve.

## Conclusion

The main objective of this chapter is to provide a general framework of the regression analysis using simple definitions and examples. It summarizes the essential of the regression analysis which highlights how to build a model and how the parameters of the regression are obtained and how the results are interpreted. This chapter is based on a very simple example to better explain regression analysis and provides a general framework for specifying, estimating, and understanding econometric model.

Regression analysis is used to test theories, estimate the causal relationships between variables, predict complex phenomena, and investigate hypotheses.

Most of the data used in the data analysis is the time series (usually financial variables) of cross-sectional data for surveys and panel data. The main technique presented in this chapter is the OLS which is widely used in social sciences.

## Appendix

# Regulation on Political Parties

Genesis Quintana
Florida Atlantic University, Boca Raton, FL, USA

## Introduction: The Regulatory Agency

Political parties in Ecuador, South America, are regulated by Ecuador's National Electoral Council (Consejo Nacional Electoral, CNE). The CNE is an independent entity that requires for aspiring political organizations to meet a number of prerequisites in order to qualify as recognized political groups or movements. The CNE's main purpose is to guarantee the exercise of political rights expressed though suffrage. Moreover, its goals are driven by standard of ethics to overview, direct, and guide the organization. In which, the CNE's website explains that its frameworks were created to promote respect, create impartiality, honesty, loyalty, and transparency to the electoral process. Therefore, it is vital to consider the role of the CNE, the regulatory entity that oversees the political parties in Ecuador.

## Regulation Expectations

Regulations are administered decrees. The CNE is an independent entity that guarantees the impartiality and execution of a party formation and electoral process. As of now, the board of directors and its staff do not measure through standardize methods the success of the entity. This lack of standardized testing to measure the performance of the success of the entity that regulates the political parties in Ecuador might hinder the growth and performance of the country's electoral process.

Adding regulation standards to measure the performance standardization works well for the private-public agencies. Regulatory standards should be added to entities that regulate political parties in Ecuador as well. Although, it could be counter argued that a standardization test does not measure improvements of success. Standardized testing the performance of an entity can demonstrate general parameters to demonstrating the entity's current functioning. The pressure to performing well can drive entities to increase its performance. Yet, in order for an entity to have the opportunity to showcase healthy progress, regulatory entities in charge of overseeing political parties should have a realistic framework of goals in place. The *Rule of Nobody* (2014) by Philip K. Howard states, "No act of government is morally valid unless it can be justified as being in the common interest" (p. 89). The purpose of government and political parties is to serve their citizens. The distrust in government increases when its citizens are participant of such service. Nonetheless, the political parties regulated in Ecuador lack professional responsibilities, values, communication, and solving problem skills. Therefore, they should keep a decree of regulations and measure the performance of the regulatory entities. For it is important for entities that regulate political parties to improve their performance and keeping its citizen involve and aware of each milestone they reach. As, this could eliminate the fear of electoral fraud by providing citizens transparency of not only the regulations used, but also its results.

When an entity that regulates political parties refuses to be transparent because of protocols Philip k. Howard (2014) describes this sort of action as, "A plague of legal bullies has descended

like locusts upon the land, using law to advance selfish goals" (p. 81). To a certain decree laws should not dictate the paradigms of a regulatory entity. Instead, if the laws prevent the entity from helping then the entity needs to change its law for more practical solutions.

Political parties' interests should never prevail over the needs of preserving the transparency of its regulatory entities. A regulatory entity should aim to improve its performance while simultaneously avoid setting up unrealistic goals. In which, policies should be reviewed to avoid ethical dilemmas. The cause to this problem can also be influenced by poor leadership skills. For if the board of directors have poor ethics, then it is most likely that the behavior will get carried out through the organization. In which, a change does not have to begin from the outside. Change can begin from the inside by challenging the Board of Director's values and making them accountable for any infraction created by their staff. Change can be originated from the inside out by also educating staff members of conflict and problem-solving skills.

## Regulation Problems

The CNE's regulatory framework to oversee political parties suffers from structural problems that hinder the entity to strive as such. Political parties in Ecuador must have the freedom and equal opportunity to participate. Yet, the CNE's lack of regulatory structures that guide and oversee political parties in Ecuador has created problems. The CNE has collaborated in the past with the National Democratic Institute (NDI) to establish openness and accountability in government. However, how much work has the NDI accomplished or if a progress has been reached with the CNE is currently unknown. In which it has led citizens to speculate the reasons for such meetings and suspicious of the NDI intentions to work with the CNE.

Moreover, the CNE regulates political parties in Ecuador by also executing sanctions to political parties for not following their entity's regulations. In order to decrease complains and lawsuits between political parties, the CNE should construct programs to establish ethical instructions that reflect the policies set forth. These instructions should include how to maintain confidentiality, equal treatment, disclosing apparent or actual conflicts of interest, and objective reinforcement. The representative which will be responsible for negotiating, reviewing, selecting contractors, etc., will partake in zero-tolerance gift and gratuity policies by not accepting anything. It is important to include whistleblower protection, compliance monitoring, and reporting requirements to make agency ethical standards more effective.

In addition, Whistleblower protection program should be set forth in the organization. In which, rewards may be given to staff who observe ethical behavior deficiencies. Reporting requirements help effectiveness of an agency's ethical standards such as the reporting of other forms of revenue other than normal agency compensation (Curry, 158). These programs could drastically impact the management of the political parties and increase its compliance monitoring against activities that inappropriately enrich officials and employees for any actions that are carried selfishly.

## Solutions to Regulatory Problems

It is evident that many countries struggle with many sorts of corruption among political parties, but it seems that enhancing professionalism can prevent risks in regulatory entities. In order to have a healthy organization, project managers need to know how to communicate with the public and conquer the ropes to digital communication techniques for planning, scheduling, and controlling political parties in Ecuador. New technology developments have allowed project managers develop more effective communication systems form part in their organization success. The history of project management forms of communications and leadership have radically changed since the 1950s. Burke and Barron (2014) explain that "without an effective system the information overload will lead to chaos" (p. 5). Therefore, it is crucial for entities that regulate political parties

to keep up with the new technologies that form part of the era so that they can continuously inform citizens of how each complain, litigation, and sanction is currently been handled. As, project managers leading regulatory entities that oversee political parties need to get educated, analyze, use, and develop the best communication tools that may fit them, their organization, and their stakeholders.

Regulations for political parties in Ecuador do not tend to plan for risk. How they achieve their objectives is peculiar as there are some risk identification methods that do help prevent failures but seem to be very primitive. In order to avoid regulatory disappointments, it is important for managers and administrators to know advanced key elements that can help identify the risks in their delivery. Regulatory entities setback and failures can be overcome in which case, Cooper and Broadleaf Capital (2005) suggest managers to develop Risk identification techniques that "May include: brainstorming; checklists; questionnaires circulated to a range of personnel; examination of previous similar projects; and specialist techniques" (p. 32). Risk identification tools can help entities regulate not only their agency, but also the success of the political parties in Ecuador. As, each political party would know what to expect from the agency and at the same time hold the leaders of the entity accountable for its functionality.

## Manager's Expectations for Regulatory Agencies

It is crucial that the regulatory agencies are under the direction of competent leaders. Leadership roles are constantly affected by fraud and lack of integrity among managers around the world. Frauds or attempts to fraud should not be ignored. It is a fact that project managers have different management styles, but regardless of this expectations and differences, project managers should use their organization's communication tools and generate their own organization's fraud risk matrix to promote regulations of political parties' integrity and transparencies standards.

Furthermore, Political parties' managers need to be aware that managing is different from leading. As, unlike managing, leadership is not given but earned. All disagreements should not be treated as bad, The Harvard Business Review (1992) remarks that "I am constantly surprised at the frequency with which chief executives fell threatened by open challenges to their ideas, as though the source of their authority, rather than their specific ideas, was at issue" (p. 83). Problems and ideas that rise from regulating political parties in Ecuador should not all be looked down or frown upon. Chief Executives or Board of Directors should not be threatened by open challenges to their ideas because differences can actually turn a negative situation into positive outcomes. Political regulatory entities need to be able to tolerate different and contradictory ideas from their staff.

Instead, managers should execute their project with strategic perspectives that are open to listen to other ideas. Project managers should not worry or get intimidates by their coworkers' ideas because they do not impact their leadership roles. Müller and Turner (2007) state that "Project managers need to focus on the task to achieve the targets for the project, and leave strategic thinking to other project roles, such as the sponsor" (p. 31). In Ecuador, the different management styles for project organization vary. Managers are held accountable for their roles; however, operative boards do not hinder managers from using their own leading styles. Instead, managers are encouraged to use advantage of their leadership uniqueness in order to deliver their projects. In Ecuador political parties do not follow a strict set of regulations. Most of the regulations are set to encourage competition between political parties.

However, entities that work with political parties have been encouraged to operate within transparency standards. It is crucial that managers understand the difference between managing an organization as a structure and managing people. Managers are held accountable and responsible for their organization's success. Therefore, the managers' expectations to lead a regulatory entity should be viewed as a role that is ever changing.

## Initiatives for Improving Work Environment

Regulatory entities that overseeing political parties become more active during electoral season. In an effort to promote a healthier workplace, regulatory entities should encourage their employees to participate in practical ways to improve individual's lifestyle and health. Regulatory entities and employees become public figures and are under more scrutiny. These employees should be taken care of so that their physical and mental health does not weaver. Regulatory entities that oversee political parties could implement rewards, benefits, free healthy snacks, and monthly lunch sessions where they have a chance to teach. Moreover, deficiencies of the program include a lack of resources and capacity to increase the number of participants in wellness initiative programs. A wellness initiative program can help improve the work environment of such entities whom operate under major stress.

A Wellness Program could enhance the compensation and benefits that employees receive providing a competitive benefits package that increases employee's satisfactions, and increments retention, and productivity. A value-based Wellness Program can highly motivate employees to increase performance productivity, thus improving organizational efficiency. Incentives are an important piece of wellness programs, as they drive participations and behavior change (Mackenzie and Shinogle 2012, p. 862). In an effort to improve the efficiency of performance, regulatory entities could use incentives, both monetary and nonmonetary incentives to motivate their employees. For instance, monetary-based incentives include gift cards awarded to employees winning a fitness challenges that could ranging from 25 to 45 dollars. In addition, implementing memberships for similar programs such as weight-loss at-work could offer employees a great incentive to participate.

Some other suggestions for Wellness Initiatives are providing healthy snacks every Thursdays, in which healthy snacks are delivered to participants once a month. For instance, apples, pears, carrots, and bananas can become available for all employees who participate in such Wellness Program. Dress down initiatives can be beneficial as well. As, the first of every month employees who dress down can participate in a physical activity during their lunch hour. Initiatives such as to memberships to programs similar to Weight Watchers at-work could be offered to the first 30 employees that enroll.

Some more cost-effective initiatives could be provided as well. As, regulatory entities near the electoral season could strive for 5 wellness challenges in which for 5 days in each month they engage in healthy eating habits and exercising. A Tobacco cessation program with several resources available to employees who join the program could help improve the work environment as well. Lunch and learn events could be initiated to provide participants with valuable information about health concerns and how to properly address them. In which, proper dental care, breast cancer awareness, and tobacco cessation program, just to mention a few could be topics discussed. These sort of initiatives and events could be held once a month.

Moreover, it could give employees the opportunity to assess their health with professionals that can advise them properly. Lastly, a healthy lunch could be provided to employees while attending conference meetings or the staff could participate in a 5 K run/walk marathon events for a chance to win prizes and cash rewards. These suggestions might not be considered prevalent in Ecuador but should be considered because "preventive medicine is safer and cheaper to practice than curative medicine" (Nykaly-Ekpemina 1989, p. 5). As, when an entity invests and provides its employees more health awareness, this promotes healthier employees and an improved workable community.

## Analysis and Conclusion

The CNE is the regulatory entity that oversees political parties in Ecuador. In addition, the CNE plays a vital role in regulating the involvement and impact of the electoral college. The citizens of

Ecuador have a stake in the program's success as this entity regulates its citizen's voting rights and oversees the transparency of the country's electoral process. A lack of regulatory structures that guide and supervise the political parties in Ecuador can led citizens to speculate the accuracy and transparency of the CNE's success as a regulatory entity.

In order to improve the CNE credibility and its reputation, a Whistleblower protection program should be set forth in the organization. In which, rewards may be given to staff who observe ethical behavior deficiencies. These programs could drastically impact the management of the political parties and increase its compliance monitoring against activities that inappropriately enrich officials and employees for any actions that are carried selfishly.

Moreover, in order to decrease complains and lawsuits between political parties, the CNE should construct programs to establish instructions that could help political parties attend arbitration before filing for a lawsuit. These instructions should include how to maintain confidentiality, equal treatment, disclosing apparent or actual conflicts of interest, and objective reinforcement. The goal of apolitical party regulatory entity should be to avoid as much conflict between the entity and the parties and among parties as well.

Therefore, the CNE should have a representative which will be responsible for negotiating, reviewing, selecting compliance standards, etc., that will partake in zero-tolerance gift and gratuity policies by not accepting anything. The CNE should establish whistleblower protection and should guarantee its staff and Ecuadorean citizens the compliance monitoring and reporting requirements to make the entity ethical standards more effective.

Lastly, a political regulatory entity that operates under large amount of scrutiny such as the CNE should invest in the well-being and health of their workers. Therefore, a Wellness Program could enhance the compensation and benefits that employees receive providing a competitive benefits package that increases employee's satisfactions, and increments retention, and productivity. For, a value-based Wellness Program can highly motivate employees to increase performance productivity, thus improving organizational efficiency. These employees should be taken care of so that their physical and mental health does not weaver. Regulatory entities that oversee political parties could implement rewards, benefits, free healthy snacks, and monthly lunch sessions where they have a chance to teach. These set of suggestions should be considered because when an entity invests and provides its employees more health awareness, this promotes healthier employees and an improved workable community.

# Regulatory Enforcement in Japan

Masatsugu Ito
Graduate School of Law and Politics, Tokyo Metropolitan University, Tokyo, Japan

## Synonyms

Discretion of local government; Law enforcement and ordinance; National style of regulation; Regulation by private entities; Administrative guidance; Regulatory enforcement

## Definition

Features of Japan's regulatory enforcement clarified based on roles of local governments and private entities, and style of regulatory means.

## Introduction

Regulatory enforcement carried out by administrative agencies and local governments covers various areas such as road traffic, environment, product safety, consumer protection, and so on. Regulatory enforcement, along with public service provision, constitutes the main elements of the administrative and policy implementation process. Therefore, there is no doubt that it is important for public administration research.

However, public administration studies in Japan have not paid enough attention to regulatory enforcement activities, and thus the amount of accumulated empirical regulatory enforcement studies is not adequate. In Japan, empirical studies on law enforcement processes are accumulated in the areas of Public Law and Sociology of Law, mainly in the field of environmental regulation. Given the results of legal research on such regulatory enforcement processes, the features of Japanese regulatory enforcement activities are discussed in the following.

## Major Role of Local Governments

The first characteristic of regulatory enforcement activities in Japan is that local governments, such as prefectures and municipalities, play a major role. In Anglo-American countries, the national or federal government enforces regulations through the field offices of the national ministry and/or executive agency. However, Japan is affected by the continental law, and since the Meiji era, regulations on national affairs have been delegated to the head of the local government as an agency of minister. This is called the Agency-Delegated Function System. As a result of the decentralization reform promoted since the latter half of the 1990s, the Agency-Delegated Function System was abolished, but it is once again widely practiced by local governments to enforce regulations in accordance with the standards stipulated by national laws.

For example, the Food Sanitation Law aims to regulate food safety from the viewpoint of national public health, but it is officials of the public health centers in prefectures and cities specified by the cabinet order who actually enforce food sanitation regulations. The Minister of Health, Labor and Welfare and the Prime Minister under the jurisdiction of the Food Sanitation Law have formulated guidelines for the guidance and monitoring of food hygiene. According to these guidelines, prefectures and cities are obliged to prepare guidance monitoring plans according to local circumstances. Based on this plan, food sanitation inspectors located in health centers in prefectures and cities conduct on-site inspections of restaurants and food plants. However, enforcement of food hygiene regulations is left to the staff of local governments.

In addition, the Water Pollution Control Act imposes regulations on water drainage actions and penetration of the underground by factories and facilities specified by the cabinet order to prevent the pollution of public water areas (rivers, seas, lakes, etc.). The wastewater standard is stipulated by the order of the Ministry of the Environment, and it imposes penalties, temporary suspension orders, and improvement orders against violation,

but the actual regulation is made by the prefectural governors and city mayors, as specified by the cabinet order. Prefectures and cities can establish stricter criteria than the national regulatory standards by ordinance. Also, according to the ordinance, it is possible to increase the target items of regulation and types of target sites. Prefectures and cities conduct on-site inspections to confirm the violation of such laws, cabinet or ministry orders, and ordinances, and issue various orders if there is a violation, but at the specific time of regulatory enforcement. The method and mode are left to the discretion of the prefecture and city.

In some cases, local government regulations precede national legislation. In order to preserve the favorable environment and landscape of the area, local governments in various regions have established landscape regulations since the end of the 1960s and have carried out voluntary landscape regulations. However, these regulations are not enforceable because they are not based on national laws and orders. Therefore, the Landscape Law was enacted in 2004: local governments specified ordinance that received the delegation of the law, created a landscape plan as a landscape administrative organization, and provided regulations by notification and recommendation to the buildings in the planned area. Along with this, it was now possible to issue a change order concerning the form, color, design, etc. of a building when necessary. The Landscape Law acts as a type of framework law for allowing landscape regulation by local government initiatives rather than for directly controlling the landscape.

Thus, in Japan, local governments have great authority and discretion regarding regulatory enforcement. The regulations directly enforced by the national government through the field offices of ministries are restricted to some regulations such as the following: labor standard supervision and labor health and safety regulations carried out by the Labor Standards Inspection Office of the Ministry of Health, Labor and Welfare; imposition and collection of national tax by the tax office of the National Tax Agency; and financial inspection conducted by the Regional Finance Bureau of the Ministry of Finance.

On the other hand, local governments are not developing their own regulatory enforcement activities in a completely isolated environment. As the regulatory standards stipulated by law are often abstract, local administrative officials can make various interpretations. For this reason, regulators in local governments communicate with officials in other local governments with similar population sizes and industrial structures and conduct regulatory enforcement activities while referring to examples and experiences of other local governments. Thus, regulatory enforcement activities are being carried out in Japan through such cross-referencing and interoffice interaction between local governments (Hirata 2016).

## Regulatory Enforcement by Private Entities

The second characteristic of Japanese regulatory enforcement activities is that the quasigovernmental organization and private sector play a major role. The Law on Total Number of Officials in a Government Organization enacted in 1969 was reduced to limit the total number of national civil servants. As a result, the increase in government organizations and personnel has been suppressed, and the Japanese public sector is relatively small among countries in the Organisation for Economic Co-operation and Development. To complement the activities of this small government, a number of quasigovernmental organizations called special corporations and public interest corporations belonging to the private sector were established. Among these, the corporation that received the designation, certification, and registration of the minister based on the laws and orders implements the specific affairs prescribed by such laws and orders; it also plays a part in regulatory enforcement activities on behalf of the government.

For example, the Light Motor Vehicle Inspection Organization, established under the revision of the Road Transport Law in 1972, has been made the designated corporation (special private corporation) for activities such as inspection of

light motor vehicles and confirmation of payment of light motor vehicle tax. In addition, the Consumer Product Safety Association established based on the Consumer Products Safety Act in 1973 plays the role of giving safe goods or SG marks to certify product safety.

Furthermore, in the field of building confirmation, private regulatory enforcement activities are being opened. Building confirmation is the act of judging whether the plan of a building conforms to the laws before construction starts. In the past, only the architectural manager installed in the local government was able to conduct building confirmation, but after the revision of the Building Standard Law in 1999, the designated inspection confirmation agency can also confirm the building. This is part of the regulatory reform carried out to expedite building confirmation and enhance administrative responses to violating buildings.

The designated inspection confirmation agency is a private corporation designated by the Minister of Land, Infrastructure, Transport and Tourism and the prefectural governor. As of December 2017, there are 27 corporations operating throughout Japan under the designation of the Minister of Land, Infrastructure, Transport and Tourism, 38 corporations operating in multiple prefectures under the designation of each Regional Developing Bureau, and 67 corporations operating within each prefecture receiving the designation of the prefectural governor.

Regulatory enforcement by private entities also extends to the field of monitoring traffic violations. To strengthen the crackdown on illegal parking, the operation of checking for abandoned vehicles was opened to private corporations by the revision of the Road Traffic Law in 2006. A corporation, such as a security company, registered as an abandoned vehicle checking agency by the police chief to the prefectural public safety commission can be entrusted with the business of checking an abandoned vehicle. A parking guard who works for an abandoned vehicle checking agency does not have authority on criminal control but confirms the abandoned vehicle, installs the confirmation mark, and reports the situation of the abandoned vehicle to the police chief.

Thus, in Japan, standard certification and confirmation inspection are widely performed by private corporations.

## "Informal Measure-Oriented" Style of Regulation

The third characteristic of Japanese regulatory enforcement activities is that it tends to use informal measures when regulators enforce regulations (Kitamura 2000).

Researchers of the regulatory process reveal that there are differences in the regulatory styles of each country (Vogel 1986). According to a study comparing the occupational safety and health regulations of Japan and the United States in the case of the automobile industry, for example, the Occupational Safety and Health Administration in the United State adopts "a much more punitive approach, relying far more heavily on the threat of detection and the imposition of penalties to coerce compliance," whereas Japan's Labor Standards Inspection Office tends to rely "much more on the willingness of employers to follow regulations voluntarily and to correct hazards once they are pointed out" (Wokutch 1992, 93).

A typical example of informal regulatory measures is administrative guidance. An administrative agency in Japan has heavily used the measure of guidance by asking private entities to conduct actions to achieve the objectives of regulation before, or instead of, official disposition, occasionally through oral guidance. Although such administrative guidance is not enforceable, it is likely that business activities will be hindered if their relationship with administrative agencies deteriorates, and so, in most cases, private entities voluntarily obey the administrative guidance.

Such administrative guidance has resulted in criticism that it gives rise to uncertain obedience relationships between government agencies and private entities, which could lead to entry regulations that hamper the entry of start-up companies. Even in the Japan-U.S. Structural Impediments Initiative, which began in 1989, the uncertainty of administrative guidance in public regulation in Japan was discussed. As a result, the

Administrative Procedure Law was enacted in 1993, and rules concerning administrative guidance were improved.

Administrative guidance means "guidance, recommendations, advice, or other acts by which an administrative organ may seek, within the scope of its duties or affairs under its jurisdiction, certain action or inaction on the part of specified persons in order to realize administrative aims, where such acts are not dispositions" (The Administrative Procedure Act, Article 2 (6)). The Administrative Procedure Law stipulates that the decision to comply with administrative guidance or not is voluntary by the opponent, and that disadvantageous treatment is forbidden if the opponent chooses not to comply with administrative guidance. Also, the law stipulates that a person who has the responsibility for administrative guidance must specify it content, and that a document must be delivered if requested by the other party.

In this way, administrative guidance was legalized, ensuring fairness and transparency of administrative procedures in regulatory enforcement. However, despite implementation of the Administrative Procedure Law, informal regulatory measures including guidance, recommendations, and advice tend to be heavily used at the sites of regulatory enforcement in Japan.

For example, looking at the enforcement status of the Water Pollution Control Law in FY 2015, only five improvement orders were made by the prefectures and cities to the facilities, while administrative guidance totaled 8243 cases. On the other hand, the facilities to which penalties were applied were limited to three cases that violated the wastewater standards (The Ministry of the Environment, Water and Atmospheric Environment Bureau, Water Environment Division, *Survey on Enforcement of the Water Pollution Control Act in FY 2015*, January, 2017). Likewise, according to the survey of the enforcement situation of the Air Pollution Control Law, prefectures and municipal officials conducted administrative guidance at 7221 facilities in FY 2016. On the other hand, the number of facilities administratively disposed by prefectures and municipalities in FY 2016 was eight, and the number of accusations of violations of emission standards and amendment ordinance was zero (The Ministry of the Environment, Water and Atmospheric Environment Bureau, Atmospheric Environment Division, *Survey on Enforcement of Air Pollution Control Law in FY 2016*, March 2017).

Why is such an informal measure-oriented style dominant in Japan? The reasons for this include various factors such as the impact of the Japanese legal and judicial systems and scarcity of administrative resources of regulatory agencies. However, researchers do not have a consensus on which factors contributed the most. Particularly noteworthy is that, in Japan, regulatory authorities have limited administrative resources, so that regulatory enforcement must be carried out efficiently and effectively. Therefore, the regulatory agency in Japan does not strictly dispose of regulated entities immediately, but takes a consultative and educational attitude to them. Regulatory agencies in Japan aim to achieve regulatory objectives through communication with regulated entities.

## Issues and Changes of Regulatory Enforcement in Japan

So far, three characteristics of Japanese regulatory enforcement have been clarified. However, these characteristics have various problems, and some changes have been seen since the 2000s.

First, with the progress of the decentralization reform, the local government's discretion in the formulation of regulatory standards and regulatory enforcement measures has expanded, and private enterprises have asked for unification of different regulatory standards for each region. Since 2014, decentralization reforms are under way to delegate to the local governments and review national regulations based on the proposals of local governments. On the other hand, in regulatory reforms undertaken at the same time, private enterprises are strongly criticizing because administrative procedures concerning business licenses and employee labor management differ among local governments. Thus, unification of administrative procedures and

regulatory enforcement between local governments is needed. Between the decentralization reform and regulatory reform, an appropriate way to conduct regulatory enforcement by local governments is pursued.

Second, regarding regulatory enforcement by private entities, compliance and capacity of regulatory entities are still issues. In the field of architectural confirmation, a structural statement fraud case occurred in 2005. In this case, it became clear that the regulatory agency and designated inspection confirmation agency did not find out that the structural calculation document was tampered with by the first-class architect. Although the regulatory agency did not see the camouflage, at that time, criticism was raised as to whether private opening of building confirmation was appropriate. Even now, regulatory enforcement by private entities is being carried out in various fields, but identifying ways to confirm the competence, fairness, and transparency of private regulatory entities is still an issue to be considered.

Third, although regulatory styles by informal-oriented means are still dominant, in some areas, more legalistic approaches are being used. During the financial crisis at the end of the 1990s, the Financial Services Agency conducted financial inspections that ensured strict asset assessment of financial institutions. The Ministry of Health, Labor and Welfare carries the stance of strict enforcement of the Labor Standards Law, as suicide from overwork has become a social problem since the 2010s. Thus, the Labor Standards Inspection Office is actively disposing and criminally prosecuting violating companies.

## Conclusion

In this chapter, Japanese regulatory enforcement is analyzed based on its three characteristics: large role of local government, regulatory enforcement by private subjects, and informal measure-oriented style of regulation. Japan's regulatory enforcement, featuring these characteristics, can be evaluated as an efficient and flexible mechanism that promotes voluntary obedience of regulated entities. On the other hand, harmful effects of creating regulations between regulatory agencies and regulated entities are also pointed out. Regulatory enforcement in Japan has been changing since the 2000s. Because of these changes, revealing the characteristics of Japanese regulatory enforcement based on international comparison is a challenge for public administration research in Japan.

## Synonyms

Regulation

*Regulatory policy* is formulated by governments to impose controls and restrictions on certain specific activities or behavior. Regulation is not only about rules of governing but also a concept in

governance. In the discussion of the rise of "regulatory states" and "regulatory governance" in recent decades, the role of governments has shifted significantly from its positive functions in society to the growing use of regulation and monitoring to direct the state. Both state and non-state actors have been engaged in the control of social and economic practices. Concerns about regulation can sometimes be contradictory. On the one hand, regulation has been regarded as barriers to and constraints on a competitive market and business environment. On the other hand, there is a genuine need to regulate risks in a "risk society" and situations of market failure. Therefore, the issues of how the concept of regulation evolves and how it transforms the roles and functions of the state in recent decades are important for discussion.

Why is there regulation? What is good regulation and how do regulators enforce it? How has regulation evolved around the world and what is the outcome? Does China fit into the framework of a typical regulatory state? This chapter attempts to answer these questions to allow readers to understand the essence of regulation and how the academic debate has evolved.

## Regulatory Rationales

When explaining the emergence, evolution, and decline of regulation, most theories can be seen as variants of interest theory (Baldwin and Cave 1999; Lodge and Wegrich 2012). The following introduces two main theories under this branch.

### Public Interest Theories

Public interest theories are based on the notion that the development of regulation is in the quest for public interests (Baldwin and Cave 1999), and thus the purpose of regulation is to achieve certain publicly desired goals that the market fails to realize. From this perspective, regulators are assumed to be impartial in that they address problems derived from market failure without considering their self-interest. Hence, the trustworthiness and disinterestedness of regulators are of paramount importance as public confidence is a necessary condition for accomplishing efficient and effective regulation as well as pursuing regulators' faith of public spiritedness (Landis 1938).

However, the public interest view has been challenged for some reasons. First, there can hardly be an agreement on what public interest means. Regulation generally leads to the emergence of conflicting interests, which public interest theories fail to take into account (Landis 1938). Another doubt rests on the presumptive impartiality and competence of regulators. While corrupt regulators may formulate regulations biased for their own personal interests (Mitnick 1980), incompetence of regulators may undermine public interest with their poor policy designs. Lastly, the public interest perspective underestimates the economic and political influences on regulations. For example, some capture theorists argue that regulation serves the interests of particular parties or sectors rather than the public as a whole (Redford 1952). In this sense, the public interest account should be considered as goals that a regulation program should ideally accomplish rather than an empirical account of regulation in the actual political setting.

### Private Interest Theories

Different from the public interest perspective, the interest group perspective regards regulation as a result of competition for power among different interest groups instead of a tool to serve universal public interests. This approach is also referred to as the interest group theory or capture theory.

Bernstein (1955) bridged the public interest and group interest theories by suggesting that the role of regulators is to carry out missions that legislators have negotiated among different stakeholders but are masked as the attempt to protect public interests. The "life-cycle theory" explains how internal and external forces account for the decline in regulations (Bernstein 1955; Huntington 1952). Four periods are identified in the cycle: *gestation*, *youth*, *maturity*, and *old age*. Regulation begins when a policy is established to protect the public from undesirable activities. In the *gestation* period, there is rising

distress in which different groups are concerned about the problems that would result from the creation of the regulatory body. It is followed by *youth*, in which the inexperienced regulatory body operates in zeal. *Maturity* follows, in which regulation becomes more mature and pays increasing attention to the needs of the industry. Lastly, at the *old age*, there is a decline of regulation when the regulatory commission gives priority to group or private interests rather than public interests.

Stigler (1971) and Peltzman (1976) differed from Bernstein (1955) in the sense that they view regulation as an inevitable product of capture by interest groups rather than a cycle of decline. They regard regulatory actions as a struggle among private interest groups who use their power to shape regulatory regimes which can maximize their utility, or in Stigler's (1971) words, "as a rule, regulation is acquired by the industry and is designed and operated primarily for its benefit" (p. 3). The underlying premise of interest group theory lies in Olson's (1965) "logic of collective action," which suggests that small interest groups have advantages over large and diffuse groups in their effectiveness in mobilization. Therefore, small groups enjoy a privilege over large groups of lobbying the state and regulators. Following this logic, regulation is "captured" by the industry, which is a small group compared to the general public, and incumbent businesses could use regulation to protect their vested interests in markets by excluding potential new entrants.

However, this perspective fails to explain all regulatory behaviors. For instance, why would the privileged factory businesses be willing to concede their advantage by agreeing to be regulated by environmental regulation that is explicitly against their interests (Williams 1976; Wilson 1984)? Are firms and regulatory commissions necessarily amoral calculators who do not bear any social responsibility, moral obligation, and consciousness? The private interest theory may not be able to explain various outcomes across different domains. Thus, it might be useful to look at the strategies regulators actually employ for a better understanding.

## Regulatory Regimes and Strategies

Despite the disputes over regulatory rationales, it is generally agreed that a comprehensive regulatory system or regime is composed of elements of standard setting and enforcement.

### Standard Setting

A well-set standard gives us clues on what goals we want to achieve, what kinds of behavior we desire, and what actions to take when the current situation deviates from the ideal one. While setting standard may seem simple, setting precise and comprehensible standards can actually be challenging. Referring to Hood (1986), there are a few preconditions for standards to be precise and effective, including being knowable and stable, being acceptable and visible, being consistent, being verifiable, and providing robustly defined categories.

Being *knowable and stable*, *or in other words*, *precision and clarity*, is the first criterion of standard setting. Precise wordings of the standard can avoid misunderstanding or ill-information and therefore fend off any unnecessary dispute. However, precise, clearly written-down rules may not be applicable in all situations. Informal understanding sometimes can be more desirable with its flexibility (McBarnet and Whelan 1991). In addition, precisely written standards may lead to problems like opportunistic behavior where the regulated parties exploit loopholes or linguistic ambiguity of the standard (Lodge and Wegrich 2012).

Second, being *acceptable and visible* means the standard has to be regarded as appropriate and as common sense. Again, this criterion may be problematic because any standard defining wrongful behavior needs to elucidate different kinds of situations where the acceptability of various involved parties may vary.

*Consistency* is the third criterion. Consistency implies that the standard should not be contradictory to other rules. Standards may become conflicting when catering for different demands and behavior, so regulators are left with considerable discretion when facing a variety of objectives.

Lastly, the standard should be open for *validation*. Standards can only be enforced when the parties know whether the rule is violated or not. Thus, the question is whether the standard should prohibit a specific behavior completely (even when there is no harm produced) or punish the behavior only when a certain level of harm is caused. For instance, we could sanction a food producer for not fulfilling the food safety regulation even though there is no actual undesirable consequence inflicted on consumers. But should we prohibit dangerous dog owning even if the dog has not created any harms?

In real-life applications, standards can broadly be categorized into rule-based or principle-based ones. Rule-based standards are specific prescriptions, while principle-based standards offer broad guidance which is relatively vague. Although rule-based standards are relatively inflexible, especially under a complex and rapidly changing regulatory environment, broad principles need rules to translate them into concrete actions. In other words, both categories of standards should supplement with each other.

## Enforcement and Compliance

Regulation aims to influence behavior; and standards are developed to clarify what practices or goals we desire or aim to achieve. Enforcement, therefore, is vital to the success of regulation as effective enforcement could direct the regulatees to avoid some undesirable behavior, and hence the regulatory goals can be accomplished. Otherwise, ineffective enforcement could jeopardize the intended results of regulation. Some core questions concerning enforcement are the following:

First, will the regulated parties that are in their self-interests voluntarily comply with rules? Some believe that compliance with standards will only be possible if the cost of noncompliance is higher than the prospective benefits of rule breaking (Stigler 1970). This perspective suggests that individual values self-interests more than other moral obligations.

Second, who should be the inspector? Even though relying on public agency can minimize the chance of business influences on regulation compared with industry self-regulation, the problem of "revolving door," where the regulator chooses an interchangeable career path between the regulatory body and the regulated industry, may appear (Makkai and Braithwaite 1992). On the contrary, some in favor of industry self-regulation argue that those within the sectors are most well informed and can lead to coziness in enforcement. In other words, self-regulation ensures effective enforcement.

Third, what kind of and how many resources are needed in the enforcement process? It is important to note that enforcement is not cost-free, so a core question to ask is to what extent noncompliance can be tolerated as it is impossible to achieve perfect compliance. In addition, resources allocated for enforcement are affected by the wider political setting and environment. Regulatory incapacity is an organization challenge facing the inspector.

As for what inspector should do for enforcing regulation, Hood (1986) suggested that regulators can respond in the following ways when facing noncompliance:

1. To persuade and advise the regulated parties so as to make them understand their reasons for compliance, which rests on the premise that noncompliance is a result of lack of information.
2. To punish the regulated parties who refuse to comply. If the regulated party chooses not to comply after their own cost-benefit calculation, regulators can encourage compliance by increasing the cost of breaking the rules.

Two major approaches are identified above: the first one is persuasion based and the second is deterrence based. The persuasion-based approach rests on the notion that it is better to prevent harm from appearing in the first place than to punish wrongdoings with harm already done (Hawkins 1984). Mediation and negotiation are seen as the primary strategies while punishment the last resort. Advocates of the persuasion-based approach argue that sanctions and punishments

will only lead to antagonistic relationships between inspectors and the regulated party (Kelman 1981). Persuasion and education, on the contrary, promote good work relationship and trust building which are beneficial to compliance. However, the drawback is that one-off inspections cannot solve ingrained problems within the organization; instead, persistent mediation is necessary for behavior modification but this could be very costly.

Differing from the persuasion-based approach, the deterrence-based approach assumes that individuals are "amoral calculators," who calculate the utility of rule breaking by weighing the costs of compliance against noncompliance (Kagan and Scholz 1984). They will only comply when it is highly probable that noncompliance is discovered and the sanction is severe. If detection is not likely, the deterrent effect will diminish. Subsequently, tough sanctions usually succeed in motivating firms to comply with the rules.

Overall, the deterrence-based approach is more suitable when the regulatees are unwilling to comply, while the persuasion-based approach is more promising when the regulatees are willing to comply but ill-informed or have shown some moral consciousness (Haines 1997). Information about and the nature of the organization, thus, affect which strategy is to be used in enforcement.

In empirical cases, regulators always apply mixed rather than single enforcement strategies. As discussed above, different conditions of regulatees may warrant the use of different enforcement strategies; therefore, Ayres and Braithwaite (1992) initiated the concept of *responsive regulation*. This approach combines both persuasion and deterrence and views the enforcement process as an "iterative interaction" between regulators and regulatees. In other words, enforcement should be responsive to the observed behavior of the regulated parties. In this approach, regulatory enforcement is a game of tit for tat: regulators will use persuasion or warning tools if the regulatees display a cooperative attitude and modify the noncompliance practices at the first place, but if the regulatees respond with noncooperative actions, regulators will escalate their actions by imposing further punishments and sanctions as deterrence.

## Self-Regulation

With respect to the question about who carries out regulatory activities, apart from state regulators as discussed above, self-regulatory organizations are another option. Self-regulation can be understood as the control a group of firms or individual experts have over their own memberships (Black 1996; Ogus 1995; Ayres and Braithwaite 1992). There are different forms of self-regulation. First, an association can self-regulate its members, and at the same time, its regulatory activity is constrained by the government. For example, the association may be limited by statutory rules, being oversight by a governmental agency or mechanism of accountability. Second, self-regulators can be fully involved in standard setting, monitoring, and enforcement. Their roles can also be restricted to only drafting the rules while enforcement is carried out by the public agency or vice versa. Third, self-regulation can be totally informal and voluntary. For example, a trade association can self-regulate their members and impose some professional, ethical, or safety standards on them, while firms are free to decide whether they should join or leave the membership.

There are a number of arguments in favor of industry self-regulation. First, self-regulatory bodies usually have a higher level of relevant expertise on the regulated industry than civil servants do. Experts within the sector are assumed to have more up-to-date information as they have close bonding with the profession compared with regulators fully independent of the business. Second, self-regulation can lead to a higher level of voluntary compliance. Since self-regulatory organizations have specific knowledge on the profession, they can set reasonable rules for the regulated (Streeck and Schmitter 1985). Third, industry self-regulation is more cost-effective than regulation by external bodies. Self-regulators have easier access to information about the status quo and recent trends of change within the industry. Fourth, the cost of enforcement is lower for self-regulators who enjoy more trust from the

regulated firms, and the regulatory cost is usually borne by those engaged in the regulation activity rather than taxpayers.

Self-regulators can still be subject to non-member controls (Baldwin and Cave 1999). For instance, they are constrained by rules that are drafted and approved by external bodies, being oversighted by external agencies or complaints and grievance-handling mechanisms. Therefore, the key factor determining whether accountability poses a menace to regulatory activities is whether it is privately or publicly controlled.

Despite these identified advantages, self-regulation is also criticized for being inefficient and insecure. Most self-regulations are voluntary in nature, so not all members within the sector are willing to make themselves subject to self-regulatory mechanisms. Thus, the public may not be protected, and empirical cases have shown that the main source of consumers' problems is unregulated firms not under self-regulatory mechanisms (Baldwin and McCrudden 1987).

Another problem of self-regulation focuses on the lack of democratic legitimacy of self-regulatory organizations. It is therefore hard to argue that public interests are served or to justify the actions of a not legitimate association. Non-members may have poor access to the regulatory process and could be excluded from goal formulation and standard setting in the first place. In addition, self-regulators are free from general legal duties to consult nonmembers before devising policies. They are also not required to justify their actions taken or decisions made. In reality, self-regulators have been accused of performing poorly in protecting public interests. For example, numerous studies have found that self-regulatory bodies tend to limit competition in order to advance their members' interests rather than those of the public (Ogus 1995).

Despite the discussed features differentiating self-regulation from state regulation, self-regulation has been incorporated into formal regulation in many cases in order to serve state purposes, such as regulating or directing economic activities in the market. In a similar vein, to secure strategic advantages in the global market, governments sometimes use regulation as a tool to compete with each other in terms of the abovementioned elements in a regulatory regime: standard setting and the enforcement system. This is where the concept of "regulatory competition" emerges.

## Regulatory Competition

Similar to typical players in a competitive market, in a globalized economy, states compete among each other in attracting investments and other favorable returns. Regulation and law making is one of the competitive domains, and this relates to the concept of "regulatory competition." The concept refers to rivalries among governments in adjustment of rules and enforcement systems to attract investors to operate in their jurisdiction or to promote a certain industry by offering a favorable business environment (Romano 1985).

Consequences of regulatory competition, however, are mixed. Empirically, regulatory competition can lead to divergent results: "race to the bottom" or "race to the top" (Vogel 1997). Regarding "race to the bottom," regulators usually apply less rigorous requirements to attract and impress producers to invest in their own jurisdiction. Less stringent standards, looser enforcement practices, and a more flexible governing environment are provided by governments as a leverage to favor the producers. As a result, governments are motivated to race to the bottom (Drezner 2001). When discussing this phenomenon, in addition to environmental regulation (Vogel 1997), empirical studies have also suggested a trend of compromise in labor rights and reduction in social welfare in developing countries engaging in regulatory competition to attract foreign investments (Rodrik 1998).

In contrast, "race to the top" suggests that in the long term regulatory competition will force regulators to establish regulatory regimes with more rigorous rules and enforcement. In particular, in the international economy, countries which want to attract more foreign investments and trade would deliberately improve national regulatory standards to stand out from markets with similar

competitiveness. This intends to show commitments and obligations to improve the production conditions in their jurisdiction with high regulatory standards. Meanwhile, to standardize their production and hence reduce the production cost, multinational corporations would also lobby governments in their production regions to adopt internationally recognized standards. For example, the term "California effect" was coined to describe the diffusing effect of transfers of environmental regulation from developed economies to less developed ones (Vogel 1995). As a result, the pull and push forces of regulatory competition have brought about stricter regulations around the world.

This kind of regulatory competition corresponds to a new development of the rise of regulatory states, which changes the nature and functions of a state. Below discusses its features with China as an example.

## The Rise of Regulatory States

The concept of "regulatory state" has become increasingly important in the discussion of public administration and regulation in recent decades. Shifting itself from a positive state to a regulatory state, its role is no longer about command and control or direct intervention in the markets, but a new type of regulatory role through the establishment of independent regulatory agencies to control social and economic activities (Ayres and Braithwaite 1992; Majone 1997; Hood et al. 2001; Braithwaite 2000; Mattli 2015).

The rise of regulatory states has two implicated shifts on public policy (Lodge and Wegrich 2012). First, the goals of public policy and administration have transformed from maximizing fairness through means such as redistribution to achieving outcomes with least resource input. This is because in a regulatory state, the tools of public policy have been the use of legal means instead of financial and organizational devices such as tax stimulus and state-owned production. Second, the roles of actors in public administration have also been modified. There is an increasing reliance on private actors to provide public services, which are overseen by new independent regulatory agencies. These agencies usually enjoy autonomy from the government and hence political force. A regulatory state also has a growing reliance on more formalized relationships among different actors within the regulated domains. As Levi-Faur (2005) summarized, "governance is no longer about the delegation of authority to elected representatives but a form of second-level indirect representative democracy – citizens elect representatives who control and supervise 'experts' who formulate and administer policies in an autonomous fashion from their regulatory bastions" (p. 13).

### The Context of China

China, as an industrializing economy, has witnessed some important transformations in the economic, social, and administrative domains over the past decades. In general, with the deepening economic reforms, the Chinese central government has transformed China from a "state-planned" to a "state-managed" economy, having more new regulations developed (Cheung 2005; Pearson 2005; Büthe and Mattli 2011).

In the government restructuring in the 1990s, the Chinese government initiated a series of reforms to strengthen the power and capacity of regulatory agencies. For instance, regulatory agencies responsible for environment, intellectual property rights, and quality standards were expanded and upgraded to vice-ministry level in terms of their administrative ranking. Moreover, a system of vertical administration directly monitored by the central or provincial government was introduced to various regulatory agencies; hence, the higher level of government was empowered to directly supervise the offices below. This ensures that all local regulatory agencies in the related areas come under direct supervision and control by the higher government. Such organizational reforms have strengthened the power of regulatory agencies, on the one hand, and ensured consistent regulatory policy implementation and enforcement at local levels, on the other hand. Yang (2002) commented that the series of government reforms since 1998 "brought China to the final stage for transforming a government

designed for central planning and bureaucratic command to a regulatory state catering to a market economy" (p. 196).

In addition, some scholars have suggested that China's commitment to international trade has driven the state to emerge as a regulatory one (Bach et al. 2006). For instance, China's entry into the World Trade Organization (WTO) has triggered regulatory reforms aiming to fulfill its requirements to promote free trade and enhance regulatory transparency. Standard harmonization – reducing discrepancies between national and international standards – is one of the key reform areas aimed to facilitate trade. To this end, China has established the Standards Administration of China (SAC) to undertake unified management, supervision, and overall coordination of standardization work. The SAC also represents China in the International Organization for Standardization (ISO) and other international and regional standardization organizations.

Despite various administrative and economic reforms, several features suggest that China has not emerged as a typical regulatory state as the Western counterparts. Instead, the control of the Chinese Communist Party over the economy has been reinforced rather than weakened after regulatory reforms (Pearson 2005; Hsueh 2011). For example, empirical studies have found that state intervention and control have been strengthened in some selected strategic industries. Compared with nonstrategic sectors like textile and food industries, the Chinese central government has created new regulatory rules to ensure state ownership and the control over strategic sectors such as telecommunications, energy, and financial services (Hsueh 2011). Institutional contexts also constrain the emergence of truly independent regulators in China (Pearson 2005). For instance, in the 2008 government restructuring reform, commissions like the National Development and Reform Commission (formerly the State Development Planning Commission) have expanded their roles in directing the economy and controlling strategic assets. It makes fundamental decisions about price control, licensing, and industry development priority. Therefore, these commissions still possess significant control over the economy and have direct influence on regulatory bodies (Pearson 2005).

In summary, instead of being a regulatory state like other well-developed democratic countries, China is inclined to become an "authoritarian regulatory state" lacking regulatory independence (Liu 2010). Empirical studies suggest that although the regulatory process in China previously occupied by administrative agencies has now been pluralized by Chinese citizens, judges, and prosecutors over the last decade, regulatory pluralism in China remains an authoritarian logic (van Rooij et al. 2016). Without the retreat of party-state control, the regulatory body still heavily relies on administrative tools to enforce regulatory policies, and too much administrative interference also jeopardizes the market and impedes the Chinese regulatory state-building (Liu 2010).

## Conclusion

Regulation is in the quest for protecting public interests that markets fail to realize. Regulatory bodies, however, may witness a decline in their regulatory functions following the life cycle of a regulatory organization. On the one hand, regulators carry out a number of functions that may not always be compatible, and sometimes even contradictory. On the other hand, they can also become captured by the regulated industries and thus serve the business interests rather than public interests. In general, regulation needs to balance different interests and values held by different actors, ranging from consumers to producers and from existing players in the market to new entrants.

Regulatory regimes and strategies are hence developed to accommodate different regulatory environments and conditions of the regulated parties. These include the setting of standards and the creation of enforcement strategies that are persuasion based or deterrence based. In deciding which strategy to be used or who serves as the regulator, one has to consider the particular situation of the regulated industry.

Self-regulation, for instance, could also serve the goals and functions of state regulation well.

In the context of globalization, consequences of regulatory competition can vary widely. "Race to the bottom" and "race to the top" are the two identified empirical phenomena in which regulatory competition results. Finally, the debate over the rise of regulatory states indicates the evolving roles of a state from direct intervention and control to regulation by independent regulatory agencies. While there is no consensus on whether China has become a typical regulatory state after decades of market and administrative reforms, some authoritarian features and logic in its regulation have remained.

# Rehabilitation and Recidivism

Samantha Bonsack
Regent University, Virginia Beach, VA, USA

## Synonyms

Amplify: Deepen, Intensify, Magnify; Conjunction: Partnership, Affiliation, Alliance; Connotation: Meaning, Significance; Detriment: Damage, Disability; Efficacy: Competence, Effectiveness; Endeavored: Aspire, Strive, Undertake; Rationale: Explanation, Hypothesis, Motivation; Recidivism: Relapse, Decline; Solidify: Cement, Strengthen

## Definition

Recidivism: to repeat or relapse in criminal behavior.
Criminogenic needs (traits): patterns, trends, and/or relationships that result in criminal behavior.
Non-criminogenic needs (traits): patterns, trends, and/or relationships that contribute to a person's attitudes, self-worth, and self-esteem.
Antebellum Era: a period in American history that occurred during the eighteenth century.
Rationalism: the idea that reason is logical and supreme in philosophy.
European Enlightenment: when reason and logic were prominent philosophical views that spread across Europe in the late seventeenth century.
Anthropologist: a person who studies human beings.
Unitarianism: a Christian theology that God is one and not three beings as others of the Christian faith believe.
Corporal punishment: physical punishment.
"What works": an expression often used by criminal justice experts and scholars in the discussion of criminal rehabilitation.
Good Lives Model (GLM): a rehabilitative model that focuses on non-criminogenic needs.
Risk-Need-Responsivity (RNR): a rehabilitative model that focuses on criminogenic needs.
High-risk offenders: offenders who have committed serious crimes such as rape and murder.
Low-risk offenders: offenders who have committed less serious crimes such as theft and minor drug offenses.
"Three strikes": a law that increases prison sentences upon three convictions of a violent and/or serious crime.

## Introduction

The USA has the highest incarceration rate among free nations (Petersilia 2011). The number of offenders in US prisons reflects a problem with recidivism that has plagued the criminal justice system for decades. Numerous scholars and reformists since the early nineteenth century have endeavored to find solutions to rehabilitate criminals with the common goal of reducing recidivism. In the 1970s, it was thought that all programs meant for treatment or rehabilitation for

prisoners were not working and that "nothing worked" to end criminal behavior. However, many forms of treatment and rehabilitation have developed with some of the treatment programs showing effectiveness in reducing criminal recidivism. The American people may have an overall negative opinion on prison rehabilitation and treatment programs, but it is essential to demonstrate how rehabilitation has reduced recidivism and how it will continue to decline with more research and studies. The purpose of this article is to review the need for rehabilitation treatment programs in the US prison system. This article hopes to act as a starting point for scholars who are beginning their studies and research in criminal rehabilitation and its effects on recidivism. The goal is to summarize a brief history of prison rehabilitation and to review the more mainstream and well-known programs and models of rehabilitation. This article advocates for treatment program models that address criminogenic traits followed by non-criminogenic traits. Finally, proposed solution that begins to address how recidivism rates can be reduced through rehabilitative treatment programs will be given. It is crucial that a model for criminal rehabilitation be applied to the entire prison system in the USA. The statistics presented by scholars and federal agencies solidify that it is time for the US Justice System to implement serious programs that will reduce criminal recidivism. It is time for prisons to not just act as punishment, but to act as institutions that reform criminals into functioning and productive members of society.

## The Great Awakening of Criminal Rehabilitation

Since the early nineteenth century, many in the field and study of criminal justice have strived to find solutions to the prison system in the USA. Dorothea Dix can be considered one of the first American social reformers who advocated for reform and rehabilitation in American prisons. Dix was an active member during the Antebellum Era of the USA when rationalism of European Enlightenment reached the shores of America (Maslin 2015). Optimism of prisoner rehabilitation was alive, and many anthropologists linked the criminal acts and behaviors of inmates to their personal lives that related to their families and social surroundings (Maslin 2015). "Most believed that rehabilitation was both possible for these criminals and beneficial for American society, and that a properly designed prison could achieve such aims" (Maslin 2015, p. 140). The Puritan idea of hard work and striving for personal excellence was popular in regard to how a criminal could become reformed. Two trends that became adapted in the prison system were the idea of solitary confinement and work by day – alone by night. These two systems of confinement were viewed as ways to reduce the likelihood of offenders reoffending (Maslin 2015). The American prison system was a hot button issue that had prominent figures such as Alexis de Tocqueville and Charles Dickens weighing in on the two trends of prison discipline.

Dorothea Dix gravitated toward the idea of solitary confinement and held the idea of Unitarianism. The principles of her prison reform view were solitary confinement, fresh air, and clean water. Dix believes that a prisoner could find a moral way of life, but in order to achieve that they must be provided with fresh air and clean water and be held in solitude so that they would not be infected with criminal behavior that was believed to be airborne and infectious (Maslin 2015). While Dix's approach to prison reform was unconventional by today's standards, her principles were based on the idea that prisoners could become morally good people of society and that corporal punishment ought to be used in severe cases (Maslin 2015). Overall she was in favor of saving souls and not punishing them. Her core beliefs of rehabilitation laid the foundation to many treatment programs that are established today.

The 1970s set the stage for some in the USA to believe that there were no rehabilitative treatment programs that resulted in reducing recidivism. In 1974, Robert Martinson conducted a survey on "What Works" in the prison system in regard to rehabilitative treatment programs reducing recidivism. In Martinson's research, he analyzed over 200 studies that ranged from education and

vocational training, individual counseling, group counseling, institutional environment, medical treatment, and the effects of rehabilitation in outside institutions (1974). Because Martinson could not conclude that specific treatment programs did work, many scholars have understood that Martinson's survey concluded that nothing worked in reducing recidivism. However, it is incorrect to interpret Martinson's study as concluding that "nothing works" but rather to realize that Martinson had concluded that, based on the research used in his survey, it was inconclusive of what rehabilitative treatment programs were effective in reducing recidivism. Martin states:

> I am bound to say that these data, involving over two hundred studies and hundreds of thousands of individuals as they do, are the best available and give very little reason to hope that we have in fact found a sure way of reducing recidivism through rehabilitation. This is not to say that we found no instances of success or partial success; it is only to say that these instances have been isolated, producing no clear pattern to indicate the efficacy of any particular method of treatment. (Martinson 1974, p. 49)

Martinson stated that there were numerous flaws in the studies he used for his survey and that because of his recognition of inconsistencies, he did *not* conclude that nothing worked. Martinson did not mean that all the treatment programs were unsuccessful but that no one model or program revealed to be a complete solution in reducing recidivism (1974). The fact that some of the treatment programs did show success in one aspect or another can lead one to think that perhaps those programs were on to something. If the variables were all accounted for and the research Martinson used in his survey was better executed, wouldn't it be accurate to state that the likelihood of those programs succeeding are just as high as the thought of them failing? Martinson did not discount the successes that were found in the research he used; therefore, hope remains that prison rehabilitation can reduce recidivism.

Some people may argue that rehabilitation does not reduce recidivism and that implementing programs in the prison system would be a waste of money. In 2011 over $50 million was poured into the US prison systems with a national average of $23,000 per inmate (Petersilia 2011). The incorporation of rehabilitation programs would add more to the national average of annual cost per inmate. However, if rehabilitation is implemented and shows to reduce recidivism, the cost per inmate is likely to decline – the less inmates per year, the less annual expenditures. It is important to consider what causes people to commit crimes. If, for example, someone has anger management problems when they are driving and cause an accident, that person may not serve time in jail or prison but they may be court mandated to attend a behavioral program that focuses on how to manage anger, find what actions or situations triggers anger, and how to avoid and manage such triggers. If it is believed that people who commit small acts of crime can be corrected by paying a fine or attending behavior therapy class or motor vehicle classes, why isn't this rationale applied to offenders who are incarcerated?

Criminal behavior is linked to the psychology of human behaviors and needs. There is a reason for every action carried out, and sometimes those actions are deviant in nature. But why commit deviant actions that result in disrupting society? Criminal behavior is psychological (criminogenic and non-criminogenic needs), and it is reasonable to believe that rehabilitation that analyzes the "why" of behavior is necessary in rehabilitating offenders into productive members of society (Andrews et al. 2011; Andrews and Dowden 2007; Fortune et al. 2012; Siegert et al. 2007). "Thus understanding *how* rehabilitation interventions or programmes work, in addition to knowing *how well* they work, should contribute to a more effective, precise and safe science or rehabilitation" (Siegert et al. 2007, p. 1604).

## Rehabilitative Models

Criminogenic needs, such as things related to social and antisocial behaviors, can trigger criminal behavior (Andrews et al. 2011). Non-criminogenic needs are areas that relate to a person's self-worth and self-esteem (Looman and Abracen 2013). It is theorized that non-criminogenic needs can also trigger criminal

behavior if not addressed. There are two prominent rehabilitation models that are known throughout the criminal justice community – the Good Lives Model (GLM) and the Risk-Need-Responsivity model (RNR). The Good Lives Model (GLM) sets its principles on a person's well-being and self-esteem and how they view their purpose in life. GLM also focuses on building positive social behaviors that lead people to live fulfilling lives with a strong sense of self-worth (Ward and Durrant 2011; Siegert et al. 2007). The Risk-Need-Responsivity (RNR) model leads with focusing on criminogenic needs but also recognizes the importance of non-criminogenic needs (Looman and Abracen 2013; Andrews et al. 2011; Andrews and Dowden 2007). Both of these models have great insight into the human psychology that causes people to commit criminal offenses.

### The Good Lives Model (GLM)

GLM was developed by Tony Ward and his colleagues and focuses on non-criminogenic needs. The GLM principles focus on needs that relate to a person's view of themselves and their social interactions. Because it is theorized that non-criminogenic needs have a direct effect on criminal behavior, the GLM looks to positively nourish those needs in order to prevent criminal behavior and live a fulfilling life (Siegert et al. 2007). The GLM is rooted in the idea that social interaction and relationships are essential and are one of the basic needs of human nature (Siegert et al. 2007). GLM has a belief that mankind is good (not in the ethical sense) (Siegert et al. 2007, p. 1609) and therefore makes it a positive model appealing to those who believe a person's self-worth and self-esteem (self-awareness) are key in reducing recidivism (Andrews et al. 2011). It focuses on the person and how that person views themselves and their place in society. If, for example, a person lacks a good family structure and a network of friends and has no prospect of a successful career due to lack of education, there may be an increased likelihood to turn to drug abuse, heavy drinking, or other deviant behaviors. Once that person has a negative self-image of themselves and an absence of self-esteem, they may continue down a path that continues to erode their self-identity and amplify the need to commit criminal behavior.

The GLM centers on the belief that all people are equal, deserve dignity, and are entitled to human rights (Fortune et al. 2012). The goal of GLM is to assist offenders in realizing their self-worth and to set goals of milestones they wish to achieve (desire for an education, family, significant other, career, etc.). Some major GLM statements that support the focus of non-criminogenic needs are (1) offenders are just like everyone else, and like everyone else they have dreams, goals, and aspirations they hope to achieve; (2) offenders are led to criminal behavior due to their lack of social acceptance; (3) no one formula of rehabilitation fits all offenders – each offender has different humanistic wants and needs; and (4) reduction of non-criminogenic needs results in the reduction of criminogenic needs (Andrews et al. 2011).

Educational programs and vocational training relate to the principles of the GLM. Lori L. Hall contends that previous research has shown that education within the prison system has resulted in reduction of recidivism. In addition to amplifying offender's confidence and self-esteem, education has benefited offenders in finding employment once they are released from prison (2015). The benefits of educational programs within the prison system are not only beneficial for released offenders but have shown they are cost-effective and benefit society because of reduced recidivism (Hall 2015). A study completed in Scotland showed that in conjunction with educational programs, the introduction of literacy and a study of the arts has had significant positive effects on offenders (Tett et al. 2012). Art-based education found that it improved offender's awareness of self, self-esteem, and confidence and allowed them to become inspired to strive for a better way of life. With an education and the receiving of a diploma, degree, or certificate, an offender will feel empowered and motivated to live a fulfilling life upon release. Educational programs improve offender's morale and self-worth, things that cultivate a positive prison environment (Harding 2014).

Prison environments have been theorized to promote criminogenic needs believed to result from how prisoners treat and interact with one another, the level of security, and the attitudes of prison staff. The interaction of offenders and security are obvious factors that have negative effects on a prison environment, but the attitudes and the level of happiness of prison staff also greatly affect the climate of prisons (Harding 2014). To think of prisons as civic communities rather than just an institution for punishment can change the perspective of how prison environments can have great impact on criminogenic needs. It is without doubt that within the prison system, offenders and prison staff have categorized prisons in regard to what is considered a good prison and what is a bad prison. The categorization of prisons as either a good one or a bad one is based on what others have experienced at those prisons. If offenders are found to be treated badly as a result of unhappy prison staff (who may have negative connotation of their work environment), that prison would earn the reputation of being a bad prison that no one would want to be detained at or work at. "The crucial point is that the prison social climate is now reliably measurable" (Harding 2014, p. 166) and should be considered when researching its effects on criminogenic needs.

The GLM has a great principled foundation focused on natural human nature needs which is why it has been adopted in clinical studies (see Siegert et al. 2007). It is imperative not to discredit the fact that non-criminogenic needs are important and crucial in the rehabilitation of offenders. However, some things do lack within GLM. The principles of GLM are relevant, but there is little evidence to show that GLM is effective (Andrews et al. 2011). When GLM is compared to a much more successful rehabilitative model, such as the Risk-Need-Responsivity (RNR) model, it does not stand a chance in comparing effectiveness in the reducing recidivism (Andrews et al. 2011, p. 737). GLM lacks long-term evaluation studies (Looman and Abracen 2013). While GLM honorably concerns itself with the well-being of the whole person, it appears to lack a focus on criminogenic needs, thus leaving an offender potentially unable to understand and know how to handle those needs should they arise. "GLM underestimates the serious possibility of criminogenic effects when the pursuit of well-being does not address an individualized understanding of the major causes of crime" (Andrews et al. 2011, p. 750). Perhaps if the GLM were to incorporate more value on criminogenic needs, like the RNR model does, it would be found to be effective in reducing recidivism.

### Risk-Need-Responsivity (RNR)

The Risk-Need-Responsivity (RNR) model is a rehabilitative model that has been a utilized in Canada, the UK, Australia, and New Zealand. RNR was initially born from research of empirical literature conducted by Donald Andrews, James Bonta, and Paul Gendreau. RNR is principled around risk management and focuses first on criminogenic needs while also addressing non-criminogenic needs. RNR is based on three principles: risk, need, and responsivity. Risk is focused on the risk level of the offender (Andrews et al. 2011). Need is in reference of criminogenic needs and identifies eight factors (the "Big Eight") (Looman and Abracen 2013). Lastly, responsivity is creating intervention specifically for each offender's learning style (Andrews et al. 2011).

RNR model focuses on high-risk offender's versus those of low risk who need minimal treatment (Campbell et al. 2015; Andrews et al. 2011). Similar to GLM in regard to social relationships and behaviors, RNR recognizes that crime can result from social relationships (friends and family) and antisocial behavior. However, where RNR differs from GLM is that the approach RNR uses is a cognitive-behavioral psychology model, whereas GLM uses a humanistic psychology model (Looman and Abracen 2013). RNR is modeled on the belief that there are behaviors (criminogenic needs) that can be used to predict recidivism. RNR looks to target those behaviors and needs, assist the offender in removing those needs, and do so by creating a plan specific to each offender based on their assessed risk and their learning ability.

One of the main criticisms of the RNR model is that it doesn't focus enough on the

non-criminogenic needs such as self-esteem, self-worth, and personal distress and emphasizes avoidant goals (Fortune et al. 2012). Other criticisms include that RNR "downplays the importance of social relationships and community involvement" (Ward and Durrant 2011). Ward and Stewart have criticized RNR for focusing too much on criminogenic needs and disregarding humanistic aspects of human nature that include friendships, loving relationships, self-esteem, and creativity (Andrews et al. 2011, p. 736). Interestingly enough, if the principles and goals of both the RNR and GLM were to be compared, it would be found that they are very similar. Further, it is evident when comparing the two models, RNR is a more complete and encompassing model because it focuses on criminogenic needs and non-criminogenic needs (see Andrews et al. 2011; Andrews and Dowden 2007; Looman and Abracen 2013). Andrews and Dowden detailed many important factors of proper implementation of a rehabilitative model by recognizing the importance of self-control (handling temptation) and how antisocial and personal relationships with loved ones can affect that self-control of resisting criminal behavior (2007). Some of the most dominant targets of the RNR focus on self-management, problem-solving, learning how to handle pro-criminal desires, and enhance "rewards and satisfactions for prosocial pursuits in the context of peers, family, school/work, and leisure/recreation" (Andrews et al. 2011, p. 743). RNR may not primarily focus on non-criminogenic needs, but they are recognized and incorporated into its model.

It is also very important to note that while the GLM lacks in significant and relevant studies to demonstrate its effectiveness, RNR has studies that have shown success. RNR has a proven record of reducing recidivism and has contributed greatly to the study and research of rehabilitation (Fortune et al. 2012; Wexler et al. 1999). RNR has also been used in mental health-related studies in regard to predicting recidivism and effectively reducing recidivism (Skeem et al. 2013; Campbell et al. 2015). RNR has been advocated by The National Institute of Corrections, the International Community Corrections Association, and "clinical psychologist who call for increased attention to the personal fulfillment of offenders" (Andrews and Dowden 2007, p. 440).

## Conclusion

The US prison system is far from solving the issue of recidivism. Since the 1970s pessimistic views of criminal rehabilitation have been prominent. In recent decades the study and research of the effects of rehabilitation on recidivism has reversed the "nothing works" attitude and has created an optimistic view that something can and does work. Reviewing the history of rehabilitation and a brief overview of the prominent rehabilitation models, recommendations can be made to work toward the goal of reducing criminal recidivism. First, of all of the rehabilitation models that are known of and have been tested, the RNR model offers the best option of a successful model at reducing recidivism. RNR has been supported and vouched for due to its success in reducing recidivism.

It is recommended that the US federal government seriously consider implementing RNR in prisons that have a majority of high-risk offenders. For prisons with lower-risk offenders, it would be beneficial to implement a program that is considered minimal and ensures that criminogenic needs are still a focus in order to reduce recidivism. An alternative proposal would be, at the very least, for the federal government to launch a national study at high-risk prisons implementing the RNR model. Studies have varied in length of measuring recidivism ranging from 1 to 3 years after offender's release. Those lengths of measurement have been found successful; however, it may be beneficial to implement a study that measures at least 8 years post offenders release in order to further test the length of time the RNR model is effective at reducing recidivism.

A second recommendation would be to expand prison work programs and ensure educational and vocational programs are available to inmates. Again, when analyzing criminogenic needs, the lack of education and work contributes to an offender's antisocial behaviors that lead to criminal behavior. To this end, the GLM's principles of

self-worth and self-esteem are relevant in regard to education and employment. The principle of achieving a fulfilling life is found in the RNR; therefore, education, vocational programs, and work programs can lead to an offender becoming motivated and confident in their ability to live a fulfilling life post release. In conjunction to ensuring these programs are available to offenders, a positive prison climate should be strived for. A positive prison environment not only benefits offenders but also benefits prison staff. The implementation of RNR, education, vocational programs, and work programs will begin to cultivate a positive prison environment.

The final recommendation would be for criminal justice legislation to remove the "hard on crime" approach. The implementation of "three strikes", minimum, and maximum sentences haven't led to significant reduction of recidivism nor has it contributed to positive prison reform. It has been found that harsher punishments, especially without rehabilitative programs, do not reduce crime. On the contrary, it can actually increase the likelihood of recidivism (Andrews and Dowden 2007; Petersilia 2011). The offense with the highest number of incarcerations in the USA is drug related. The penalties for certain drug offenses that include possession, distribution, and paraphernalia are dependent on the drug. Regardless, these penalties and punishment haven't seemed to fix the problem of the "drug war" but appear to have only amplified it. Perhaps a more appropriate way to handle substance abusers is to ensure they are enrolled in a rehabilitative treatment program based on the RNR model while serving for first, second, and third offenses. By focusing drug abusers on methods and behaviors to rid them of their criminogenic need for drug abuse, it may, more than likely, have a direct positive effect on the recidivism rate of drug offenses.

A huge detriment for implementing such programs is the cost. The prison system accounts for a good portion of the US budget; however, if offenders can be rehabilitated and therefore not recommit crime, the overall cost of the prison system will likely decrease even after the cost of implementing rehabilitation programs. A study that conducted a cost analysis of the Amity Prison Therapeutic Community (TC) treatment program in California found that the rehabilitation program potentially reduces the cost of incarceration if effective programs were implemented (see McCollister et al. 2003). Of course, the study wasn't without potential variables that may prove opposite of what the study found. However, the study can be considered a great point to start at when analyzing cost-effectiveness of rehabilitation.

In conclusion it is worth noting that the recommendations presented in this article are not without unaccounted variables or factors. Unfortunately, not every offender can be rehabilitated. Some offenders are best kept away from society in order to preserve safety, peace, and stability. However, it cannot be ignored that a great number of offenders have been abandoned and not given the opportunity to receive treatment or assistance for something such as first offense of theft or drug possession. The intent of this article was to offer recommendations and act as a freshman approach to an issue that is in desperate need of improvements and solutions. It is admirable what so many scholars and researchers have found and accomplished in the area of criminal justice. By no means is there a simple solution to this very complex problem, but perhaps there is hope on the horizon for the US criminal justice and correctional system.

In October of 2015, Senator Chuck Grassley (R) of Iowa introduced a bipartisan Sentencing Reform and Corrections Act of 2015. The bill addresses the issue of over incarceration rates plaguing the US prison system and models itself after successful rehabilitation programs out of Texas. The bill aims to reduce recidivism and reduce cost. It is very encouraging that this complex issue is being discussed in the halls of Congress and hopefully will be the beginning of successfully riding the "nothing works" attitude and actually proving that there are solutions that do work.

## Definition

| | |
|---|---|
| Rehabilitation | It is an act of formally restoring people from ill mental state to better socially acceptable and stable state. It is done to transform lives of offenders who have been convicted for crimes or undergoing trials in the law court by engaging them through educational or vocational skills and utter employment. It makes offenders responsible by becoming law-abiders and no longer law-breakers. |
| Rehabilitation Programs | It entails all efforts made especially by government to transform and better the lives of prison inmates. The purpose is |

R

to reinstate the accused/ offenders back into the society.

Prison Inmates These are persons confined in a locality having been convicted or held in custody pending their prosecution in court of law. The duration of confinement is dependent on the sentence by a judge.

## Introduction

Prisons are established to restrict those legally incarcerated or awaiting trial in various courts of law for safekeeping as well as curbing of menace in the society. However, except for those that received capital punishment through the pronouncement of execution sentence on them by competent courts of law, prisons are expected to reform as well as rehabilitate those incarcerated toward their reintegration back into the society on completion of their prison sentences (UNRISD 2018). To achieve these goals of administration, reformation, and rehabilitation, it will be expedient to train and retrain prison inmates during their period in captivity. This requires exposing them to adequate and timely education and vocational trainings as well as welfare and information programs which will eventually change their orientation and belief about making a living.

Debate of what to do with offenders has always supported changing them to law-sustainers, that is, rehabilitate and reform the offenders. Berman (2004) asserts that reasoning and rehabilitation were originated in the Republic of Canada, particularly for criminal justice settings. Reasoning and rehabilitation program derived its basis from model of social learning which assumes that law-breakers have failed to gain fundamental understanding and social skill essential to decide on life situation challenges using anti-social methods. The program therefore teaches partakers challenge-tackling methods and social methods, including dialogue, bargaining, controlling effusive tendencies, and intellectual thinking, all according to a detailed manual. The program is presently implemented in penal institutions and correctional facilities in Canada, the United Kingdom, many regions of the United States, Sweden, Finland, Norway, Spain, and Holland, among others.

The rehabilitation of inmates begins from the first minute in prison to the last minute of immurement. This is to actualize the utilization of those skills acquired from rehabilitation programs in order to live a crime-free and legally productive life in the larger community. There are various programs or ways that can be put in place to change law-breakers to law-abiders, by ensuring that crime remains unattractive to them, through moral training, vocational training, art/craft learning, religious teaching, and educational programs. Despite this prodigious idea, much effort is yet to be channeled toward rehabilitation and reformation in Nigerian prison. Ekpenyong and Undutimi (2016) stated that reports have frequently shown that a period in Nigeria's penal institution does not really have impact in rehabilitating prisoners and most of them return to criminal activities upon release. Some argue that most inmates do learn new methods and better ways of committing crime and escape while in prison with more hardened criminals. Also, they connect with inmates and others who they can also make connections with and become more deeply involved in the criminal world.

The foregoing has resulted into high rate at which recidivism is occurring in Nigerian prisons, causing security challenges in the country and resulting into prevailing congestion in our prison system. Ayodele cited in Uche et al. (2015) asserted that the rate of recidivism in Nigeria is a cause of concern. Rehabilitation of prison inmates has not really had an effect on them, as yearly, convicts who became more hardened and dangerous are reintegrated to the society as against rehabilitated individuals expected from the prison. These necessitate assessing the effects of rehabilitation programs for prison inmates in Nigeria with focus on prison facilities across Southwestern Nigeria. This will reveal to the prison administrators, policymakers, and the society how to improve rehabilitation of prison inmates to solve the problem of congestion and other societal consequences.

## Scientific Investigation to Inmates' Rehabilitation in Nigeria

The investigation is descriptive. It involved the administration of questionnaire and the conduct of personal in-depth interview with the various stakeholders. It covered prison inmates in Nigerian prison facilities in Southwestern Nigeria. Since population of prison inmate changes almost every minute and every day, the total number of inmates in Ogun, Osun, Oyo, Ekiti, Lagos, and Ondo States as of 30 December, 2017, which is 5,116 inmates, was taken as the study population. These were divided into convicted and awaiting trial categories. The categorization assisted in the sampling only of those convicted and awaiting trial in the selected prisons. The analysis adopted a multi-stage sampling procedure. In total, 256 copies of questionnaire were administered to inmates in selected prisons which represented 5% of population proportionately allocated to each stratum.

The two Heads of the Departments (Health Unit and Social Welfare Unit) in each sampled prison were selected for in-depth interview. In addition, 12 recidivist prison inmates were also randomly selected, 2 each from categories of inmate population for interview to elicit information on the adequacy of rehabilitation programs and its effects and challenges in Nigerian prisons. Two representatives of a non-governmental organization (Health and Prison Welfare Initiatives) and two representatives of Redeemed Christian Church of God and NASFAT Islamic Foundation were also selected for interview to elicit information on their support toward rehabilitation programs in the selected prisons. Data collected were analyzed using descriptive and inferential statistics.

## Quantitative Description of the Effect of Rehabilitation Programs on Prison Inmates in Southwestern Nigeria

This chapter presented the quantitative and qualitative data analysis as well as interpretation of the view of respondents on the effect of rehabilitation programs for prison inmates in Southwestern Nigeria. Table 1 shows the quantitative analysis on frequency distribution and percentage of sampled respondents on each of the variables stated to

Source: Field Survey 2018

test the effect of rehabilitation programs for prison inmates in Southwestern Nigeria. In addition, qualitative data obtained from interviews were used to complement the quantitative data obtained so as to ensure detailed discussion on the adequacy of rehabilitation programs for prison inmates in Southwestern Nigeria.

As shown in Table 1, the first variable was on the effect of cognitive behavioral therapy programs on prison inmates to test the effect of rehabilitation programs for prison inmates in Southwestern Nigeria. The respondents were asked to react on the effect of cognitive behavioral therapy programs in improving inmates' understanding on how to make a living in Southwestern Nigeria. The result showed that 41.9% of the total sampled respondents rated cognitive behavioral therapy programs as highly effective on inmates as a rehabilitation program to improve inmate understanding on how to make a living, 46.1% of the total sampled respondents rated cognitive behavioral therapy programs as moderately effective as a rehabilitation program, 2.1% of the total sampled respondents rated cognitive behavioral therapy programs as fairly effective, 2.5% of the total sampled respondents rated cognitive behavioral therapy programs as poorly effective, while 7.5% of the total sampled respondents rated cognitive behavioral therapy programs as a rehabilitation program for prison inmates in Southwestern Nigeria.

On the effect of counselling program on the prison inmates in Southwestern Nigeria, the respondents were asked to react to counselling program's ability to change inmates' orientation and belief about life as being part of the rehabilitation program. The result showed that 36.9% of the total sampled respondents rated counselling program being part of rehabilitation program as highly effective in changing inmate orientation and belief about life, 41.5% of the total sampled respondents rated counselling program as moderately effective, 1.2% of the total sampled respondents rated counselling program as fairly effective, 17.4% of the total sampled respondents rated counselling program as poorly effective, and 2.9% of the sampled respondents rated counselling program as not effective in changing orientation and belief about making a living.

On the third variable, educational programs have effect on the rehabilitation of prison inmates, the respondents were asked to react to educational programs' ability to prepare inmates in Southwestern Nigeria for better future after incarceration. The result showed that 45.2% of the total sampled respondents rated educational programs as highly effective in preparing inmates for better future after release, 49.8% of the total sampled respondents rated educational programs as moderately effective in rehabilitation of prison inmates, and 15.0% of the total sampled respondents rated educational programs as fairly effective as rehabilitation program for preparing inmates for better future after release.

On the fourth variable, religious activities and programs have effect on inmate rehabilitation in Southwestern Nigeria, the respondents were asked to react to religious programs' ability to improve understanding of Godly way of life as an effort toward rehabilitation of prison inmates in Southwestern Nigeria. Table 1 showed that 68.0% of the total sampled respondents rated religious programs as highly effective in rehabilitation program toward making inmate understand Godly way of life, 27.4% of the total sampled respondents rated religious programs as moderately effective, 3.3% of the total sampled respondents rated religious programs as fairly effective, and 1.2% of the total sampled respondents rated religious programs as poorly effective in rehabilitation of inmate to understand Godly way of life.

As regards the fifth variable, information and communication technology has effect on inmate rehabilitation in Southwestern Nigeria, the respondents were asked to react to the effect of information and communication technology as part of rehabilitation program for prison inmates in Southwestern Nigeria. The result showed that 16.2% of the total sampled respondents rated information and communication technology program as highly effective in rehabilitation of prison inmates by improving their knowledge and enhanced skills, 18.7% of the total sampled respondents rated information and communication technology program as moderately effective in rehabilitation of prison inmates, 21.6% of the total sampled respondents rated information and

communication technology program as fairly effective, 19.9% of the total sampled respondents rated information and communication technology program as poorly effective, and 23.7% of the total sampled respondents rated information and communication technology program as not effective in rehabilitation of prison inmates in improving their knowledge and skill.

The sixth variable on Table 1 was on vocational programs being a basis of self-sustenance for inmates after imprisonment. The respondents were asked to react to the effect of vocational programs as a rehabilitation program for self-sustenance of prison inmates in Southwestern Nigeria after the period of imprisonment. The result showed that 30.7% of the total sampled respondents rated vocational programs as highly effective as a rehabilitation program assisting self-sustenance of prison inmates after imprisonment in Southwestern Nigeria, 62.7% of the total sampled respondents rated vocational programs as moderately effective for self-sustenance of prison inmates after incarceration, 4.6% of the total sampled respondents rated vocational programs as fairly effective in enhancing self-sustenance of inmates after imprisonment, and 2.1% of the total sampled respondents rated vocational programs as poorly effective in enhancing self-sustenance of prison inmates after the period of imprisonment.

As regards the seventh variable, healthcare programs enhance mental and physical readiness to learn during rehabilitation, the respondents were asked to rate the effect of healthcare programs on enhancing inmate mental and physical readiness to learn during rehabilitation within prison facilities in Southwestern Nigeria. The result indicated that 18.3% of the total sampled respondents rated healthcare programs as highly effective, 50.6% of the total sampled respondents opined healthcare programs are moderately effective, 27.0% of the total sampled respondents opined that healthcare programs are fairly effective, 3.3% of the total sampled respondents opined that healthcare programs are poorly effective, and 0.8% of the total sampled respondents opined that healthcare programs are not effective in the rehabilitation program for prison inmates in Southwestern Nigeria.

The eighth variable in Table 1, recreational programs enhance inmates' preparedness for life after confinement, the respondents were asked to react to the efficacy of recreational programs' ability to enhance inmates' preparedness for life after confinement as rehabilitation program for prison inmates in Southwestern Nigeria. The result showed that 31.5% of the total sampled respondents opined that recreational programs are highly effective in enhancing inmates' preparedness for life after imprisonment, 59.8% of the total sampled respondent opined that recreational programs are moderately effective, 5.0% of the total sampled respondents opined that recreational programs are fairly effective, and 3.7% of the total sampled respondents opined that recreational programs are poorly effective.

## Qualitative Description of the Effect of Rehabilitation Programs on Prison Inmates in Southwestern Nigeria

A cross-section of interviewees noted that the vocational program was a very effective rehabilitation program for prison inmates in Nigeria. Prison inmates were able to learn one or two skills during their period of imprisonment such as carpentry, barbing, hairdressing, shoemaking, and bag making, among others. There was a designated work shop within the prison for all the trainings. The heads of Social Welfare Unit in the sampled prisons explained that government effort in this aspect of rehabilitation is excellent, as there were provisions of facilities for various entrepreneurial skills for the inmates so that they can be useful for themselves after their stay in confinement. Also, adequate support from various non-governmental organizations complements that of the government, assisting with materials and tutors and even preparing graduation ceremony to certified inmates that have been through with their training. The certificate was the same you can get outside in the larger society, so the question of their training being inferior will not arise at all. Sometimes, those NGOs provide aftercare services such as provision of technical equipment for inmates, either on the graduation day or

during their release, to assist them in setting up the learned skill. There are reports of some inmates doing fine with the skills acquired during their stay in prison.

Interview revealed that counselling and cognitive therapy programs were effective rehabilitation programs. The Heads of the Social Welfare Units in the selected prisons revealed that there is counselling unit with a professional, who identifies the reason for anti-social behavior of the inmates that led to imprisonment and understands how to assist the inmates to overcome such drive for unlawful attitude. These also assist in engaging inmates in vocational programs and religious activities that will help them to overcome such bad tendency for anti-social behavior. It was revealed that the prisons achieved tremendous result in this aspect of prison service, with inmates able to live a better life even during their period of imprisonment as well as outside of the confinement area. This submission negates the conclusion of Oroleye (2018) about the suitability of the environment in the rehabilitation of inmates.

Most prison officials believed that education is essential for lawful behavior in the society. Despite this, the revelation from interview on educational program discovered that there is a wide disparity in the provision of this educational program among the selected prison facilities. The question of effectiveness of this educational program cannot be deduced to be the same across prison facilities. The Heads of Social Welfare Unit in Ilesha Maximum Security Prison and Olokuta Medium Security Prison revealed that only adult literacy program is available, adequately and effectively carried out in the prison with recorded success in inmates' ability to read and write, for those that were unable to do so before imprisonment. It was also revealed that effort is being made to ensure remedial program (for SSCE makeup) and National Open University of Nigeria (NOUN) program for various degree programs.

The head of Social Welfare Unit at Ibarra Medium Security Prison revealed that adult literacy, remedial program, and degree programs are all available, adequate, and effective. He disclosed that adult literacy is the combined effort of the government, NGOs, and religious bodies, while remedial program, for those who enroll for NOUN programs but have deficiency in their SSCE, is carried out by NGOs. Therefore, inmates only enroll for NECO exam not WAEC, to make up O-level requirement for NOUN program of their choice under full scholarship of the NOUN management. He also revealed that NOUN program just started here about 3 years ago, when he was transferred from Kirikiri Prison in Lagos, where it is being carried out effectively when compared with his place of primary assignment. However, it is yielding result today as many inmates are already enrolled and are going on with their programs, with regular supply of materials and NGOs' support in providing tutors for their computer-based examination here within the prison.

It was revealed that religious program was very effective in selected prison facilities. Various religious groups and associations organized prayers, counselling, and religious study for inmate on their selected faith. There are churches such as Redeemed Christian Church of God, Winners Chapel, Deeper Life Christian Church, and Pentecostal Fellowship Christian Church, among others, having regular visit to the prison, teaching bible lessons, and organizing prayers for the inmates. They also work with the counselling unit to assist in the rehabilitation of the inmates and have been successful to a large extent. There are Islamic groups also, like NASFAT Islamic Foundation and Ansar-Ud-Deen Islamic Foundation among others, carrying out similar activities to that of their Christian counterparts. The question on traditional religion activities revealed that inmates are either Christian or Muslim, with no provision for traditional religion, even though the constitution of Nigeria provides for the three religions.

Interview revealed that ICT program was not effective in all selected prison facilities. The Head of the Social Welfare Unit of Olokuta Medium Security Prison stated that effort is put in place for the supply of required equipment necessary for ICT program, meaning there is no training of ICT in the prison at the time of this analysis. In Ilesha Maximum Security Prison, the head of the Social Welfare unit revealed that despite the presence of some computer system, it cannot be said to be

adequate, let alone effective, as the State Command is making all effort to improve this present condition. It was discovered that computer systems are not being used as there is no assigned officer for tutoring inmates. The result is not the same in Ibarra Medium Security Prison, where NOUN degree examination is majorly computer-based. This enhances ICT training for inmates, as the basis for enrolling into a degree program. ICT is said to be effective and improve the knowledge of inmates. However, it is regulated with strict rules for inmate, to avoid breach of security and other misuse of the facilities.

Interview with the officials revealed that healthcare program is effective for all the inmates. On regular basis, a medical doctor is posted to the prison from the Ministry of Health, to ensure preventive healthcare of the inmates and attend to minor sickness and in which serious cases are referred to government hospital on his order and written instruction. Prisons ensure clean environment, which is the first health measure, and regular sanitation. There is constant supply of drug from the Ministry of Health, and NGOs are also supportive in that area too. Recreational programs were revealed to be effective in ensuring mental and physical balance of inmates. Regular football matches are organized for the inmates, as well as table tennis and all other forms of games, for both male and female. We do have inter-prison and intra-prison competition on a regular basis, with the support of NGOs, business organizations, philanthropists, private individuals, and religious bodies.

It was revealed that case work is also an effective rehabilitation program in prison facilities through legal aid from volunteer legal practitioners. There are inmates who cannot afford legal fees and are having minor cases such as fighting, assault among others, which just require little legal effort for their bail. Prison officials in conjunction with those legal practitioners assist those prison inmates through their cases in courts. NGOs also support in this rehabilitation programs which have recorded successful feat in the administration of prison in Nigeria. In addition to quantitative data, responses from interviews show that inmates are learning on how to contribute to the society and live a crime-free life upon release from prison. Also, non-governmental organization has been able to record successful trained inmates on various vocational programs with occasional graduation ceremony organized for certification. A recidivist inmate interviewed asserts that rehabilitation programs are now successful stories compared to his initial imprisonment. He started that he has been able to acquire knowledge on carpentry work, which he believed will serve as a means of living upon release from imprisonment, different from when he was firstly imprisoned when nothing was in place, except to pray and wait for judgment or number of days.

This analysis was in congruent with the study of Gideon and Sung (2011) that cognitive prison programs are effective in that inmates are taught to cultivate positive thinking as means to correct criminal behavior. Jonathan (2011) also reported through his investigation that many inmates are succeeding in the classroom and that educational programs are having a significant impact upon the rate of re-incarceration. He went further that those inmates who participated in correctional educational program tend to be model citizens while in prison, as they generally make better decisions in prison and less likely to just follow the crowd.

On the effect of rehabilitation programs for prison inmates in Southwestern Nigeria, it was reported that 36.9% of the total sampled respondents rated the counselling program being part of rehabilitation program as highly effective in changing inmate orientation and belief about life and 41.5% of the total sampled respondents rated counselling program as moderately effective. Also 45.2% of the total sampled respondents rated educational program as highly effective in preparing inmates for better future after release, and 49.8% of the total sampled respondents rated educational program as moderately effective in rehabilitation of prison inmate. In the same report, 68.0% of the total sampled respondents rated religious program as highly effective in rehabilitation program toward making inmate understand Godly way of life, and 27.4% of the total sampled respondents rated religious program as moderately effective being part of rehabilitation program. Meanwhile, Ugwuoke and Ameh (2014)

based on evidence from Kogi Prison observed the relationship between participation in rehabilitation programs and absence of recidivist in the sampled prison with 85.5% agreement of opinions.

Quantitative analysis was also supported by Gigeon and Sung (2011) who reported that cognitive prison programs are effective because inmates are taught to cultivate positive thinking process as means to correct criminal behavior. Interviewed officials stated that rehabilitation programs have been yielding positive result in Nigeria, with reduction in the rate of recidivist over the past few years. Prison administrators are aware of the reduction in recidivism since NGOs, religious bodies, and private individuals among others are supporting prison rehabilitation programs.

## Conclusion

Rehabilitation programs for prison inmates were at the core of the administration of prisons in Nigeria, Africa, and most parts of the world. Prisons are not expected to act as containment in custody alone but to identify reason for anti-social behavior, reform, rehabilitate, and reintegrate offenders back into society to become law-abiders. This core function is aimed at reducing re-incarceration, suppressing security challenges, and reducing congestion in Nigeria's prison facilities. The reorganization of Inmate Training and Productivity, a Directorate in Nigeria Prison Service, saddled with the responsibility of implementing rehabilitation programs, with the idea of private partnership with institutions such as National Open University of Nigeria and other non-governmental organizations since 2012, has resulted into improved adequacy and effect of rehabilitation programs on prison inmates in Southwestern Nigeria. The resultant effect has led to inmates completing degree programs while in jail and some becoming professionals in various skills such as carpentry, hairdressing, shoemaking, soap making, barbing, etc. during the incarceration period. With these qualifications and skills, inmates become useful for themselves and the society at large upon release from prison.

## Synonyms

Change management; Governance; Public Management; Reform; Reorganization of public administrations; Service design; Service professions; Sociotechnical design

## Definition

Governance and organization design are political, legal, organizational, and cultural processes

aimed at creating a better and cheaper administration and at regaining people's trust in the administration: in most cases, they may lead to a substantial reinventing government together or also without large legal reforms.

## Introduction

The New Public Management (NPM) approach at the beginning of the eighties became popular mainly because of its promise to reduce public administrations costs. NPM suggested to apply to the public sector styles and methodologies typical of private corporations by giving public managers more autonomy and accountability, developing indicators and control procedures for performance management, and fostering competition with the private sector (Hood 1991).

The transformation of "bureaucrats" into "public manager" however in the European countries was slow and uneven. Farnham et al. (1996) charges to the administrative law the different pace of such a transformation: rather successful in UK, Finland, and The Netherlands based on common law, medium-low successful in France, Belgium, and Italy, very low in Germany and Spain where public organizations are fully ruled by administrative law.

The idea of *governance without government* (Rhodes 1997) was proposed in Europe as a wider approach based upon the idea of networks among public and private actors which cooperate to attain common goals and develop social capital. Kickert and Klijn (1997) proposed the governance approach as an alternative to government based upon the authoritarian and centralistic model of policy making.

In all European countries in fact NPM soon had to face three main challenges. The first challenge was to free the Administration from "red tape" by eliminating useless rules, regulations, procedures, and ineffective processes: making public administrations simpler, less bureaucratic, and more citizen friendly. The second challenge was to jointly improve services, organization, and technology and to mobilize employees' energy, thus obtaining a paradigm shift from an administration that merely regulates and authorizes to a one that provides, directly or by outsourcing, optimal services to citizens with minimal costs. The third challenge was to build a positive identity, increase prestige, and abolish corruption in central and local public administrations.

The abovementioned challenges of course can benefit of professional new managerial behaviors and of a new governance model, but they also require structural changes in service design, organization, technology, jobs, what is named as an integrated *sociotechnical system* based upon non-bureaucratic paradigms and oriented toward the joint optimization of efficiency, quality of service, and quality of working life (Trist and Murray 1993): this is what may lead to really reinvent government. In the next paragraph, we are going to explore who, how, and when develop at the same time a new Public Management, a new governance, and the design of new sociotechnical public systems.

## Strategy and Organization Choices for Facing Challenges

Political movements, legislators, administrators, and scientists still argue about the main alternative strategies for meeting the three abovementioned challenges.

The debate has been often polarized among multiple choices, often seen as alternatives: (a) legislation enforcing legal rights versus design of services; (b) legislative reforms of formal structures and procedures versus change management of processes, organization, and behavior done by public management; (c) work defined by bureaucratic rules versus professional work. In fact they are not alternatives but rather dilemmas, because both polarities may be jointly optimized.

1. *Legislation enforcing legal rights versus design of services.* Many western constitutions establish the priority and sacredness of the rights that all public affairs should protect. The protection of the citizen rights from the public administration includes, among others, jurisdiction, health care, social assistance,

education, work, and many more: they are dictated by national constitutional charters and by the ordinary legislation. Law sets regulations and provides resources to give access to services related to infrastructures, public utilities, education, welfare, registry activities, and others, but also to preserve and protect collective goods (e.g., justice, tax administration, police, licensing). But promising legal protection of these rights is not equivalent to actually meeting the needs with appropriate services: just think of the right to work constitutionally established in some western countries denied by the high level of unemployment.

In fact, citizens' needs are satisfied not by compliance with a law or an administrative procedure, but only through the design and delivery of appropriate services. Service design means to provide and optimally integrate all the three main components of services: (i) the "concept" of socially and economically desirable services; (ii) the engineering of service processes and the joint design of technology, organization, and people roles and skills; and (iii) the appropriate delivery oriented to end user satisfaction.

Citizens' legal rights to receive services therefore are brought into reality by an appropriate design and management of the organization, technology, professional systems really capable to deliver services at a reasonable cost and quality. Optimal combination of legal rights and service design is the first step for reinventing government.

2. *Legislative reforms of formal structures and procedures versus change management of processes.* The usual great difficulties in implementing changes dictated by a new law are sometimes charged to insufficient political will, to bureaucratic rigidity, and to lack of public employees' skills. The truth is that legislative reforms in most cases do not include the processes of organizational and professional implementation.

   On the other hand, the redesign and implementation of organization, technology, and professional systems is a very complex process. In private companies, this is the responsibility of management, within the stakes of shareholders strategies. Also public managers have a considerable room of maneuver within the stakes of the law and of the superimposed institutional power: but this is often avoided or hindered, by a literal compliance to law or a bureaucratic behavior.

   So, the second step for reinventing government is to combine good legislation with good use of the room of maneuver of public management.

3. *Work defined by bureaucratic rules versus professional work*. Impartial behavior by civil servants requires well-defined duties and responsibilities: the foundation of a good bureaucracy, as Max Weber (1978) stated, is based upon law and regulations. On this base all regular activities within a bureaucracy can be regarded as official duties; management has the authority to impose rules, and rules may easily be respected on the basis of established procedures. In addition to this, public employment in many European countries is largely regulated by law.

   On the other hand, good services require professional roles and skills based upon specialist knowledge, processes are designed for taking care of external and internal customer needs, and work is performed in teams. All that respecting but going largely beyond any formally defined rule (Crozier 1963): customer satisfaction is first. In synthesis in most cases the public employee is required to act not only as a civil servant but also as a professional, who is characterized by a distinctive (or even exclusive) knowledge, professional ethics, and ideal for service.

   Public jobs in the NPM approach are in essence *Service Professions*, which means "operating units within the organization that provide the most qualified part of the service and are entrusted to people with the right skills, resources and rules" (Butera 2016). The public administration already includes professional work model because it employs certified professions such as lawyers, doctors, engineers, and architects. There are, however, much more cases of qualified roles and professions that are

not included in any professional orders: e.g., computer analysts, social security consultants, and social service specialists. But also "normal jobs" as public officers and front office employees in many European Public Administrations are evolving towards *service professions,* because are constituted by open roles featured by responsibility on results, management of relationships with citizens and colleagues, and technical and behavioral skills.

This is the third step of Reinventing Government: reconciling the public nature of the civil servant work with the professional behaviors and statute of Service Professions.

## Three Patterns of Structural Change

In the Western world, there are three major patterns of public administration structural change processes: legal reform, osmotic change, and planned change process.

(a) The model of change as *legislative reform* starts from the assumption that a system changes when a law is introduced that modifies the formal rules. This is the preferred model in continental Europe: Germany, Spain, France, and Italy. In this model, politics set the strategies giving rise to a political arena during the controversial preparation and approval of the reform, which often arrives late, incomplete, and ineffective. The bureaucratic execution is often closer to compliance rather than to results (Crozier and Friedberg). The bureaucrats then should deal with the implementation, as General De Gaulle said "l'intendance suivrà."

The preference for the legal-normative approach is rooted in strong cultural and structural traditions: cultural because of the dominance of administrative law and the centralistic models of government and structural because the legislative reform "in se" deals with raising consensus, hiring, managing real estate, and affecting power structures. Public administration in fact in most countries has a high share of stable employment representing a large quota of electoral base (Cassese e Franchini 1994). Besides, the public administration controls huge symbolic and material resources (Crozier and Friedberg 1977). The legal rigidity is often protection of status quo: when positive projects for the redefinition of public services and processes have been proposed (Borgonovi 1966), angry voices have often arisen about the alleged "corporatization" of public administrations.

(b) The "*osmotic change"* model derives from the concept of "osmosis" and implies a flow of gradual change consisting in the continuous adaptation of processes and organization to the changing context and to the culture of people involved. This is, for example, the case for the continuous change in public school systems: teaching styles, practices, and methodologies slowly adhere to the changes in the student population, in the multiethnic structures of society, in the societal change of culture and values, and much more.

(c) The "*planned change process"* model is close to the Anglo-Saxon tradition and consists of planned programs promoting a variety of actions intended to produce a change: these programs try to activate all kind of available innovation processes and to foster people "energization" or "mobilization" (Mayntz 1985; March and Olsen 1989; Thoenig and Dupuy 1983). This model defines a medium to long-term plan to promote a range of localized changes at central and local government. Changes are related to the structure and functioning of public administration.

The *planned change process* model can be implemented both at national and individual organization level:

(a) A *national framework program* including both some top-down/longitudinal projects and the promotion of reorganization projects in various single administrations. The framework program may imply:
- Leadership by the Head of Government
- Program management assured by the Ministry of Public Administration (or similar)

with the support of other Ministries and Regions
- Purposeful synergies between state, regions, and local authorities
- Well-designed partnerships between public administration and private companies
- Convergence between research agencies (university and nonuniversity) and public administration
- Agreements with unions and intermediate bodies

In this kind of programs, the main stakeholders define and agree upon a series of values, parameters, interinstitutional cooperation, and new paradigms of system design. These programs may actually bring to life the *Governance Model* indicated by Rhodes.

(b) *A structural change management,* that is a reorganization project in a single large administration that includes:
- A plan for the partial or total redesign of a public administration like a ministry, an agency, a region, a municipality, and namely of the service system, the organizational and technical system (objectives, organization, technologies, people management system), the social and cultural system (professional system, training, etc.)
- A series of pilot projects focused upon problems
- A continuous and planned implementation and improvement activity

This approach overcomes the rational and linear approach of first planning, then developing projects and then experimenting and implementing: project or continuous improvement may come first and the institution-wide change plan may be decided afterwards. In such a way a recursive spiral of changes in the socio-technical system and of learning processes may be developed, reinforcing each other.

Within this approach, a New Public Management engages public managers not only in taking responsibilities within the *business as usual,* but also in participating in change and innovation of structural and cultural dimensions.

A national framework program may promote various structural change management processes in single administrations, as in the US case presented in the next paragraph. But structural change management may be performed also without any national framework program.

## A Case of Nationwide Planned Change Process of the Entire Public Administration. The US Reinventing Government Program

The most famous case of *planned change process* at a nationwide level is the Clinton and Gore US *National Partnership for Reinventing Government* (NPR) (1992–1997). Very influential in the conception of the program was the work of Osborne and Gaebler (1992). The purpose stated by Al Gore was to "create a better and cheaper administration and to regain the American people's trust in the administration" (Gore 1993). It had two main guidelines:

- An *Analysis, Improvement and Reorganization Program for Federal Agencies*, coordinated by the "Office of Personnel Management (OPM)": a large number of projects with a strong involvement in each administration of the management, personnel and a share of the users. Two types of projects were performed: a great number of *demonstration projects* (Demo) where service, organization, and personnel management were redesigned, also in derogation of the applicable laws; a great number of *reinventing laboratories* (Labs) devoted to process reengineering and introduction of new technologies. The projects were proposed, studied, and implemented by the same executives and personnel of the concerned administrations and were supported by central structures of the National Performance Review, largely involving universities, ICT, consulting, and training companies.
- An *Electronic Governance Development Program* provided by two federal bodies: the "Government Information Technology Service Board (GITS)," which developed strategies

and implementation of longitudinal projects of information technology through various Federal Administrations, and the "Office of Management and Budget (OMB)" which coordinated the interdepartmental teams engaged in the optimal use of ICTs.

The results of both programs in those years were remarkable (Osborne and Hutchinson 2004): over 800 implemented actions; 137 billion dollars of cost reduction achieved; 348,000 employees relocated to more productive functions; abolished 640,000 pages of internal regulations; and 16,000 pages of federal rules, all that with the highest degree of consensus between Government and Trade Unions.The President and the Vice President of the United States assigned a primary political and strategic importance to the Program for three reasons: tangible results on the federal budget; participation of citizens, public employees, and trade unions, with a resulting improved trust in the Administration; and shift of federal budget and industrial policy from military to public administration. Al Gore's political gain was so great that he got the highest number of individual votes in the presidential campaign against George Bush.

Buntin (2016) reviewed the US program stating that it "has made a mark on governments everywhere."

## Summary and Conclusion

Multistakeholders Governance and public socio-technical redesign are the main road for effectively reinventing government.

Reorganization of public administration may be achieved through legal reform, osmotic change, and planned change. They may be developed jointly.

A framework program at a national level as in the US case is desirable, but it is possible also to launch framework programs limited to a nationwide single large complex administration, like judicial, sanitary, school systems.

In single administrations, a Structural Change Management methodology may be applied, adopting a recursive set of plan, pilot projects, and continuous improvement. In any case the management of single administrations may use their "margin of maneuver," and employees may participate giving value to their knowledge and experience. Participative design may make New Public Management approaches effective.

The Education University of Hong Kong, Hong Kong Institute of Education, Hong Kong, China

## Synonyms

Civil servant training; Civil service training; Government training; Public servant training

## Definition

Public sector training refers to an instructor-led, content-based intervention, leading to desired changes in civil servants' behavior.

## Introduction

The significance of intellectual research into human resource management (HRM) in the public sector has long been disregarded or given only cursory recognition despite the distinctive context of the public sector (Brown 2004; Burke et al. 2013). Being a crucial part of HRM, training in the public sector has been unreasonably neglected. Central training agencies in many parts of the world have traditionally played an important role in formulating training policies and providing support to departments in training and development matters. When the New Public Management (NPM) reforms emerged, institutions' focus in providing training was altered. The NPM is a movement toward a greater stress in the use of government tools in the delivery of services (Sanchez 2003, p. 8). The reform has been aimed then to deregulate the activities of public officers, giving them more freedom to manage and to make the public sector less distinctive as separate social realm from the private sector (Sanchez 2003). Owing to the tide of reform, the original focus of training agencies in providing training has been enhanced, while departmental training or purchasing services from private providers. Such terms as "customer oriented" and "result oriented" are highlighted in the NPM vocabulary. Though not all countries and institutions threw themselves into the reforms, many picked something from the NPM menu (Pollitt and Bouckaert 2011).

## Civil Service Training: From Traditional to "Customer-Oriented" Approach, From Centralization to Decentralization

During most of the twentieth century, training management in the public sector was mainly concerned with imposing standardized routines (Sanchez 2003, p. 10). The traditional language of training emphasizes teaching in line with the law. Training interventions were restricted to sporadic programs oriented to demonstrate the newest management tools available and update individuals' technological skills (Sanchez 2003, p. 10). As Schmidt (1991) argues, the traditional training model seems inadequate to fulfill the tasks contemporary public administration is required to perform. Rather, it seems to be too "generic, slow and tenuous" (Sanchez 2003). However, influenced by the ideas of NPM, public officials attending training programs are viewed as "customers" or "clients." "Customer focus" has become a burgeoning theme in public management. The prescriptions of being "close to" and "responsive" to customers originate from theoretical applications of economics as well as from the broad transfer of business practices to public management (Paarlberg 2007, p. 201). Increasingly, government training agencies are required to focus on customer satisfaction (Huque and Vyas 2008).

On the other hand, effectiveness rather than process has been emphasized to achieve result-oriented management. Training effectiveness is assessed by considering results or evaluation, trainees' performance, and their ability to transfer techniques to their jobs (Huque and Vyas 2008). The concept of customer orientation has been introduced and developed modeled on market orientation, which emphasizes responsiveness to customers' needs, competitiveness, and capacity to disseminate information (Narver and Slater 1990). Customer orientation, also known as customization, is "an employee's tendency or predisposition to meet customer needs in an on-the-job context" (Brown et al. 2002) and can be divided into three characteristics: prioritization of customer interests, use of customer information, and organizational measures to satisfy the customer (Paarlberg 2007).

The training aspect in the public sector has also turned to decentralization. Decentralization is defined as the transfer of authority or responsibility for decision-making, planning, management, or resource allocation from any level of government to its field units, district administrative units, other levels of government, regional or functional authorities, semiautonomous public authorities, parastatal organizations, private entities, and nongovernmental private or voluntary organizations (Hope and Chikulo 2000, p. 28). There can be horizontal decentralization which disperses power among institutions at the same level of vertical decentralization which allows some of the powers of a government to be delegated downward to lower tiers of authority (Hope and Chikulo 2000). The primary objectives of decentralization include, but are not limited to, overcoming the indifference of government bureaucrats to satisfying the needs of the public; improving the responsiveness of government to public concerns; and increasing the quality of service provided (Hope and Chikulo 2000, p. 29). It has the advantages of creating greater diversity of practices, better recruitment and training, and increased responsibility.

## Civil Service Training in Hong Kong

In the early year, training and development of civil service was part of the localization policy of the colonial government to include local ethnic Chinese as far as possible (Burns 1988). Training programs were designed as induction courses of government departments and vocational training of administrative procedure within the government, which was mainly for newly recruited local staff. The Establish Branch (former Civil Service Bureau, CSB) formed the central training unit to coordinate all training and development issues, and the unit later restructured as the Government Training Division in 1967. The division was not just responsible for localization purpose but also efficiency improvement purpose (Burns 1988, p. 20). The training division later became two separated parts, including the Civil Service Training Centre (CSTC) offering general training in vocational, language, and management training to civil service and the Senior Staff Course Centre (SSCC) providing executive development at higher level.

Following the Sino-British Agreement in 1984, the localization of the Hong Kong civil service escalated. In response to calls to dismiss senior-level expatriates, the government launched an HRM consultation (Scott 2005) and decided against extending the contracts of civil servants employed on agreement terms, including expatriates (Cheek-Milby 1989), while new recruits would be employed on "new permanent and pensionable terms" (Civil Service Branch 1993). Consequently, the Civil Service Training Centre and Senior Staff Course Centre were combined in 1996 and renamed the **Civil Service Training and Development Institute (CSTDI)**. It was intended to coordinate all civil service training activities and provide courses on national studies and Putonghua to help public servants understand the latest developments in Mainland China (Civil Service Branch 1994). Civil service training during the pre-handover period served not just localization but also the convergence of differences of administrative practice with China (Huque and Vyas 2008). After the handover in 1997,

interaction and cooperation with China became more important in civil service training in the jurisdiction.

After the handover of sovereignty in 1997, chief executive Tung Chee-hwa launched consultation on human resource reform, which directly affected the structure of training. The consultation document, *Civil service reform: Civil Service into the 21st Century*, suggested that radical changes of civil service recruitment were necessary to ensure potential talents would not flow to the private sector and recommended that the permanent, pensionable terms appointment should change to contract agreement in recruitment (Civil Service Bureau 1999). The initial impacts of these measures are limited because of the government's decision of freezing recruitment of civil service, and all newly recruited civil servants were required to serve on an initial probationary contract years for 3 years to judge their performance for 3 years further contract before accede to permanent and pensionable terms (Scott 2005). Table 1 showed the key changes of structure in 2004 when CSTDI merged into Civil Service Bureau (CSB).

| 2. Increasing emphasis on e-learning as distinct from classroom mode of provision |
| 3. Adopting an "account manager" approach to deal with departmental clients |
| 4. Promoting a "managerialized" and "customerized" role of CSTDI to address clients' needs |
| 5. Shifting direct control of training provision to advisory and consultative service |

Source: Vyas and Luk (2010)

However, the civil service training function in this period became more decentralized, focusing on departmental needs and preparing for increasing demands on performance (Huque and Vyas 2008). Figure 1 shows that the number of consultancy programs conducted by the CSTDI steadily increased between 2004 and 2010, revealing that the increasing trend of engaging advisory and consultancy services had become a major factor in training.

In Hong Kong SAR, the CSTDI is a designated agency with training of public servants as one of its main missions. In accordance with the Civil Service Bureau (2015b) and Legislative Council Panel on Public Service (2015), while policy bureaux and departments provide vocational

**"Re-invention" of the Public Sector Training, The, Fig. 1** Number of consultancies conducted by the Civil Service Training and Development Institute for Departments, 2000–2010 (Source: Financial Secretary of Hong Kong SAR. (2000–2010) Budget Speech for the year 2000–2001 to 2009–2010, Expenditure Analysis by Head, Head 143 – Government Secretariat: Civil Service Bureau. Retrieved from http://www.budget.gov.hk/2014/eng/previous.html)

training to meet job-specific needs of public servants, CSTDI focuses on training programs and activities (such as thematic workshops and seminars) that "are best provided by a central training agency," such as leadership and management, language and communication, etc., covering four core service areas, namely, senior executive development; national studies programs on the Basic Law and policies and developments of the Mainland on political, economic, social, and cultural aspects; HRM consultancy service; and promotion of a continuous learning culture. Such training programs are mainly tailor-made for senior civil servants, who are core employees in the government. Lepak and Snell (1999) described core employees as high-value, high--uniqueness employees whose skills and knowledge are a source of competitive value to organizations. Their value and uniqueness may be based on tacit knowledge that would be valuable to competitors, and these skills and knowledge are related to core processes developed internally and built up overtime. Senior civil servants as core employees play a critical role in the formulation and execution of the government's policies and strategies, and they serve as the linking pin between top managers and the operating core. They possess skills of high value and high uniqueness and contribute to the government's strategic objectives and help establish competitive advantages. Since their skill sets are not widely available in the external labor market, the training programs for senior civil servants tend to be centralized, which is suggestive of an internal development system. As for the junior civil servants, their skills are of lower value and uniqueness. The government therefore tends to engage in contractual relationships through outsourcing or the hiring of temporary trainers and manage their performance through compliance to ensure that clearly established standards are met. Under the compliance system, employees will receive the minimum training required to conform to organizational rules and to keep the labor costs low in order to match fluctuations in demand for goods and services. Hence, unlike senior civil servants, junior civil servants are exposed to less career development opportunities.

As for the content of the training provided by CSTDI, it is general in nature. Unlike job-specific training, general civil service training covers issues with high priority for the public service as a whole and requires uniform understanding, know-how, and principles of action to be adopted and implemented in different organizations in common areas (Metsma 2014). However, delivery of civil service training programs often engages private providers. According to the Civil Service Bureau, the leadership programs and management workshops conducted in 2012 and 2013, which targeted at senior civil servants, were led or delivered by local or distinguished scholars, prominent speakers, subject experts, and guest speakers from relevant fields, who were engaged to share their personal experiences and insights on topical subjects, such as executive health, social media, and global economic issues (Civil Service Bureau 2013). Job-specific training courses and experience sharing sessions, in contrast, are organized in-house by training units at policy bureaux and departments. For instance, the Staff Development Section at the Rating and Valuation Department of the HKSAR tailor-makes training programs for its civil servants on the Department's computer systems, valuation practices, and work procedures (Rating and Valuation Department 2010). In other words, training programs involving technical expertise, seminars, experience sharing sessions, and brainstorming sessions are outsourced to private service providers such as local universities and management consultants (Efficiency Unit 2008; Hong Kong Correctional Services 2013), considering that bureaux and departments may not have all the necessary skills and expertise required to manage the whole or part of the procurement process. Outsourcing sophisticated and complex outsourcing projects may be more effective and efficient to bring in specialist consultants with relevant knowledge and experience to assist them (Efficiency Unit 2007). Since 2001, the Efficiency Unit has established a dedicated team to assist government bureaux and departments to enhance the use of the private sector in the delivery of public services. In addition, a Training Sponsorship Scheme is offered to civil servants, encouraging them to pursue learning through

external courses. Under the Scheme, civil servants remunerated on or below HK$28,140 or equivalent may apply for reimbursement of course fees for self-arranged studies. The sponsorship ceiling is HK$6,000 per applicant per year for a maximum of three courses, all to be pursued outside office hours (Civil Service Bureau 2015a).

## Conclusion

Training can lead to the process of re-shaping organizational operation routine to increase productivity and efficiency. Decentralization of decision-making in training seems a solution to develop government employee competencies. Training in the Hong Kong public sector has become more demand driven rather than supply driven. Confronted with the issue of civil service training, the Hong Kong government initially chose the most hierarchical method of provision: centralization. As time passed, she could no longer rely only on centralized provision. Decentralization and outsourcing were introduced strategically in order to meet multiple demands. During the evolution of civil service training, it is obvious that centralization, decentralization, and contracting out are blended in the provision of training; nonetheless, governments may achieve the expected results with diverse means according to their own needs.

# Relational Leadership Theory

Chrysavgi Sklaveniti
Institute of Organizational Psychology,
University of St Gallen, St Gallen, Switzerland

## Synonyms

Post-heroic leadership; Socially constructed leadership

## Definition

Constructed in relationships, under plural possibilities ranging from inter-individual (entitative) or mutual (processual) constructions.

## Introduction

Since the early 1990s, the field of leadership has been experiencing the *relational turn* and has been moving towards understanding leadership from the perspective of relationships. Relational leadership theory has developed in acknowledgment that individual-centric theorizing does not fully tap into the complexities of leadership work. Rather than focusing on the impact of the individual, relational leadership theory focuses on togetherness and draws attention to the variances between agency and participation, as well as individual and collective. In doing so, many deeply held assumptions about the nature of leadership are challenged. Notions, such as control and independence, are interpreted differently through a relational lens to explain relationships between leadership participants. Slowly gaining momentum, relational leadership theory has recently gained popularity in the field of leadership with amplification and diversification of scholarship investigating this theoretical perspective. This proliferation of work suggests that relational leadership is more than a trend in the field; it represents novel, cutting-edge thinking aiming to enliven the study of leadership with its social parameters. However, the proliferation of work on relational leadership is also coupled with increased ambiguity. The understanding of the "relational" differs significantly across various approaches: while all start from the founding assumption that leadership does not reside solely in the leader, there are profound philosophical differences in the way the relational is conceptualized. The remainder of this entry will present the strand of theoretical perspectives comprising relational leadership theory, outlining their different philosophical orientations, and will then bring to the fore the significance of relationships in leadership work.

## Defining the Relational

Relational leadership theories shift attention to what transpires between individuals and center relationship as the locus of leadership. While academics and practitioners participate in the relational turn, they develop different philosophical understandings about the study of relationships of leadership. The meeting place of all these different understandings is the awareness that leadership is not a lone, secluded action. Instead, leadership lies in the collective action of interconnected individuals, an outlook that challenges deep-held assumptions about leadership, such as individualism, agency, and independence. Responding to these challenges requires first to distinguish between the different philosophical understandings

around relational leadership to then move on to a discussion about what these offer to the conception of leadership. Views about relationality in today's leadership arena fall into the following two broad philosophical domains: entitative and processual stances. Each one follows distinct explanatory modes to frame, discuss, and conceptualize the relational in leadership (for an extended discussion see Uhl-Bien and Ospina 2012).

On the one side, an entitative perspective on relational leadership views leadership as starting from individuals and extending into collaboration between one or more sides (Bolden et al. 2011 offer a comprehensive overview). Leadership is produced by *interacting individuals* that are in relationships, with the production of leadership available from others than the appointed leader. Individual agency is still a key parameter determining leadership action; the distinction from traditional individual-centric theorizing lies in the ownership of leadership, which can now be located in multiple individuals. The underlying premise is that one individual cannot embody all the capacity needed to deal with organizational reality; therefore, there is the need to shift attention from individual to diffused forms of leadership. This diffusion brings about an arrangement or network of interacting individuals that come to form relationship. The entitative philosophical domain on relational leadership is primarily concerned with examining the conditions of diffusing leadership to achieve organizational goals, under the assumption that interacting individuals are separated from each other before coming to form relationships. On these grounds, an entitative lens describes relational leadership as a multidirectional relationship of influence, through which interacting individuals align their actions towards the common goal to ensure organizational performance. Leadership concerns more than the appointed leader: it spreads outside formal hierarchical structures, which means that it be expressed by followers as well, and it can also shift overtime. Studies of relational leadership in the entitative domain apply their logics of inquiry towards the exploration of the characteristics, behaviors, and actions of interacting individuals as they constitute relationships to influence each other. Noteworthy contributions include theories such as vertical dyad linkage –later extended to leader member exchange, team, self-leadership, shared, integrative, co-leadership, distributed, and even draw from complexity theory. These theories share a common focus on interacting individuals as they engage in relationships of leadership but vary significantly in their evaluation of the quality and engagement in these relationships.

On the other side, a processual perspective on relational leadership conceptually demotions the role of the individual (Hosking 2011). This ontological position contests the hegemony of the bounded individual as well as the separation between leader and followers. Leadership is not an outcome of action that can be traced back to individuals or networks of individuals; it is a *process*. This implies that relationships are not independent of the individuals making them; they go on among individuals, and the only characterization that would then be possible about individuals is that they are temporary expressions of these relationships (Gergen 2009). Such a processual understanding questions individual agency as the source of leadership and redefines participants engaged in leadership beyond rational and self-contained entities. Rather than the producers of leadership, individuals are relational participants in the process of leading. Instead of separating between leaders and followers, leadership becomes a process of negotiating social order, where the labels "leaders" or "followers" do not exist in advance. Labels do not come before relational processes; they become in the process. The processual philosophical domain on relational leadership is primarily concerned with studying leadership in action. Starting from the premise that leadership does not precede relational interaction, the focus is on studying how relating to one another brings about orientation and organizational achievements – leadership direction. On these grounds, a processual lens describes leadership as a mutual process of relating to one another in pursuit of direction. The core for studying leadership becomes reciprocal

relationships, which are difficult to measure with standardized formulas. With attention on *how* leadership is expressed, rather than *who* expresses it, processual approaches study leadership as it unfolds in everyday settings and attend to its performance. Still at a nascent developmental stage, contributions to the philosophical domain of processuality include perspectives termed as strongly processual, co-active, post-modern, or as adopting a soft differentiation between self and other. These contributions create a thinking space around which leadership is no longer an elusive concept but a living quality characterizing how people work together in organizations.

To conclude, the field of relational leadership encompasses a variety of philosophical stances which can be broadly categorized between the two different perspectives of entitative and processual lenses. Starting from dissimilar philosophical understandings and following distinctive aims, these two domains place relationships as the denominator of leadership. Entitative approaches study relationships as the outcome of interacting individuals, sharing the diffusion of leadership. Processual approaches study the dynamics of leadership, where relationships are made together with the individuals constituting them. The diversity of the topics explored under these two philosophical domains indicates the urgency to study relationships and their implications about leadership as well as the rich discussions through which relationality gains legitimacy in the field of leadership studies.

## Why Relational Leadership?

Bringing relationality to the forefront means engaging with the powerful idea that the concept of leadership is a collective achievement in a nexus of relationships. The conception of relational leadership has thus emerged to convey the ways of taking up relationality to explore the connections that bring together participants in leadership work. The potential of relationality resonates with the world of practice, which is striving to meet the modern organizational challenges of post-industrialism, technology-driven structures, and social media-oriented societies. These conditions render the organizational environment highly social and point to the need to understand the relational nature of social processes, such as leadership. To demonstrate the potential of relationality, below are three key implications about the nature of social processes stemming from relational theories, offering new insight into the field and practice of leadership.

The first insight offered by relationality about the practice of leadership is that it is constructed together with others. This implicates a dynamic view of leadership that is co-created in the interface of multiple participants. It also implicates that leadership is not a static or a given achievement; rather, it is developing and changing alongside participants' relationships. The involvement and inclusion of sociality place emphasis on collective action, while diminishing the dependence on leaders. Leaders and their followers are not necessarily the sole agents of leadership; leadership work may be achieved without having predefined specific hierarchies or roles among individuals. This is the case for example in project work or creative industries. Juxtaposing this realization against organizational reality, there emerges the acknowledgment that single individuals are not the sole bearers of success or failure. Organizational outcomes can thus be attributed relationally to multiple participants, giving rise to renewed appraisal and performance evaluation systems. Such happenings are a significant departure from individual-centric perspectives that see leadership as involving behaviors of specific individuals labelled as leader and followers.

The second insight of relationality has to do with the nature of leadership. Relational leadership is a pervasive social phenomenon, and as such it occurs in a context that needs to be acknowledged. To explore and explain the dynamic of leadership, a relational description is needed; one that goes beyond individuals and investigates the space between them. Relational leadership does not occur in a social vacuum, where universal truths can be applied. To understand the space in-between participants in

relational leadership, it is important to zoom into their lived experiences. This produces leadership discourse and narratives that may not necessarily converge around the same conclusions or viewpoints. Different participants may offer diverse experiences from their involvement in leadership work. Centering sociality in the study of relational leadership goes beyond producing context-specific descriptions. The value and promise of sociality lies in the reciprocal effects of relationality, rendering the pursuit of organizational goals a map of multiple possibilities. Therefore, there is no optimal route to achieving relational leadership; rather, there are various paths participants can take to reach desired destinations. The selection and pertinence of the route that comes to be the way for relational leadership critically depends on participants' relationships.

The third insight of relationality indicates that relational leadership can be developed; it is not a natural gift or a birth right. Typically, leadership development training involves the selection of those individuals labelled as leaders, who are tasked with cultivating characteristics such as charisma, perseverance, or authenticity. Considering that relational leadership develops in a social context, it is important to explore how participants working together can develop a collective competence, leading to the attainment of desired goals. From this outlook, relational leadership development is about working on modes of engagement and commitment against the background of collective action. This can be achieved by including various participants from across the organization and focusing on developing those characteristics underscoring togetherness, such as responsiveness to one another, reciprocal understandings, or acknowledgment of the other's position. Such types of leadership development could also place the training within specific organizations and within specific networks of participants, thus building collective competence that is directly linked to a specific social context. In doing so, relational leadership opens up to radical types of leadership development that are no longer about individual performance but rather thrive on plural participation.

## Conclusion

Presented in diverse philosophical approaches, relational leadership theory centers sociality and conceptualizes leadership as emerging from relationships. In doing so, it brings fresh insight into the leadership arena. It goes beyond concepts of dependency on single individuals to concepts based on notions of interdependent collectives, recognizing that leadership may occur outside formal authority. Relational leadership theory allows to explore the emergent nature of leadership, created by participation, interconnection, and embeddedness in social contexts. This shifts attention to the practice of leadership: rather than assuming that leadership is a priori and de facto produced by formal authority (appointed leaders), relational leadership theory examines relational interactions signifying the process of leading.

By centering sociality, relational leadership theory also unsettles the notion of followers. Followers are too participants in leadership, not just mere subordinates to leaders. Rather than framing fellowship as a hierarchical arrangement, relational leadership theory changes focus to participation that constructs leadership in such ways that leaders are created when fellowship occurs. Therefore, there is a movement from accepting the impact of the leader to focusing on the relational interactions among participants doing leadership work. From this outlook, relational leadership theory is concerned with the ways relationships are developed to achieve desired organizational pursuits. Finally, the emphasis on sociality offers a novel way to approach leadership development. Following the tenets of relational leadership theory, training involves more than single individuals labelled as leaders; instead, leadership development seeks to build social capital that has the potential to support togetherness in pursuit of collective achievements.

# Relations Between Institutionalized Public-Private Partnerships and Their Public Clients

Christian Lohmann[1] and Alexander Ströbele[2]
[1]Managerial Accounting and Control, Schumpeter School of Business and Economics, University of Wuppertal, Wuppertal, Germany
[2]Institute of Management Accounting and Control, Ulm University, Ulm, Germany

## Synonyms

Contract renegotiation; Objective system; Public clients; Public procurement; Public shareholders

## Introduction

Institutionalized public–private partnerships (PPPs) are joint venture companies whose shareholders are the public institution and the private investors involved. Institutionalized PPPs are often responsible for the development and production of specific public goods and services. The decisions that determine these processes are made jointly by the public institution and private investors, who form a partnership to achieve their financial and social objectives (Klijn and Teisman 2001). Institutionalized PPPs can be regarded as an extension of contractual PPPs, because their aim is not only to operate efficiently but also to achieve high investments by taking advantage of both the capital of the private investor and the typically lower cost of the capital of the public institution (Hart 2003; Marra 2007).

Besides organizational aspects, the discussion on PPPs has to consider the people or institutions that use a PPP's products and services (the users), as well as those that pay for these products and services (the payers). A PPP can provide products and services directly to third parties, such as citizens or companies, or to the public institution that is part of the partnership and makes these products and services available to the end users. Similarly, either the end users or the public institution that is part of the PPP pay for those products and services. In the latter case, third parties (i.e., the end users) pay either a subsidized price or use the PPP's products and services for free.

When the public institution acts not only as a partner in the institutionalized PPP but also as a public client of the PPP, it can negotiate and renegotiate the agreement with the PPP as a whole or with the private investors of the institutionalized PPP. In contrast, third-party users or payers cannot negotiate with the PPP; they can, however, react to the price at which the PPP offers its products or services by increasing or reducing demand. As a result, renegotiations tend to favor the PPP as a whole and the private partners in particular, but at the expense of users and payers, who have to shoulder a reduction in product or service quality or a price increase (e.g., Bajari et al. 2014; Shleifer 1998). One exception to this pattern is the case where the public institution that establishes an institutionalized PPP is both the user and the payer of the PPP's products and services at the same time. In such cases, the public institution may have the bargaining power to achieve its own objectives. Prominent examples are institutionalized PPPs in the military service sector where the public institution has a dual role as a main shareholder and, at the same time, a major customer.

## PPP's Set of Objectives

A private partner to which public tasks have been contracted out tends to behave opportunistically because of the conflict of interests between the public's objective of welfare maximization and the private partner's objective of profit maximization. Public welfare is maximized if goods and services are produced at minimum cost and provided to the public institution for prices that reimburse the private partner. In contrast, the profit of the private partner is maximized when goods and services are produced at minimum cost and provided to the public institution for prices that exceed the cost. Profit maximization tends to ensure or increase efficiency in the production of goods and services; however, at the same time high prices lead to a reduction in public welfare. From the public institution's point of view, the PPP's objectives need to be met in a way that aims at cost minimization, instead of profit maximization. To adjust the PPP's objectives in this manner, it is necessary to set up an institutionalized PPP whose public principal is simultaneously a main shareholder.

Choosing institutionalized PPPs over the alternative of delegating the implementation of public tasks wholly to the private sector allows the public institution to retain direct control over the institutionalized PPP. As the main shareholder, the public institution involved is in a position to influence each PPP's objectives and frame them in line with its own objectives. Wherever the public institution determines to a significant extent a PPP's objectives, it can also determine which objectives have priority. In such cases, the institutionalized PPP delivers the public tasks and services in accordance with the requirements of the public institution. In their theoretical model of the provision of public services, Bennett and Iossa (2006) assume that the representatives of the public institution influence the relative importance of the institutionalized PPP's profit objectives and social welfare objectives.

As participants in the institutionalized PPP, the private investors are able to enforce their objectives to a smaller degree than they would in conventional private business partnerships. Because of the public institution's influence, cost minimization is defined as the common objective of both categories of shareholders, which the PPP should strive to meet. On the contrary, profit maximization is not expected to be an important objective for the PPP, because it cannot be pursued as long as the public institution, apart from being a main shareholder, simultaneously acts as a major customer of that PPP (Lohmann and Rötzel 2014). The setting of institutionalized PPPs in which the public institution plays a dual role as a major customer and shareholder also implies conclusion on renegotiations between institutionalized PPPs and their public clients. A high degree of congruence between the objectives of the public shareholder and the institutionalized PPP should decrease the PPP's opportunistic behavior with respect to the execution of public procurement contracts.

## Renegotiations Between Institutionalized PPPs and Their Public Clients

The PPP's set of objectives determines its behavior in renegotiations. If the objectives of the public shareholders and of the institutionalized PPP as a whole are congruent to some extent, this is expected to limit the PPP's opportunistic behavior toward the public principal. If the PPP does show opportunistic behavior, however, this is expected to occur after the decision on public procurement has been made. While the public institution is still considering public tenders, the potential supplier aims to make a bid quoting a low price in order to increase the probability of winning the bidding process. After the decision has been made, the PPP may take advantage of renegotiations – which may arise, for example, from changes in the government's procurement policies or in the demand for goods or services – to act opportunistically by charging an inappropriately high rate that will result in higher profit. If, however, the objectives of the public institution involved and the private partners are aligned, potential renegotiations should not increase profitability for the institutionalized PPP.

The empirical findings of Lohmann and Rötzel (2014) substantiates that institutionalized PPPs do not benefit from renegotiations, because the congruence between the public and the private partner's monetary objectives with respect to profit maximization and cost minimization prevents them from acting opportunistically. When the PPP's bargaining power and the profitability of the contract are taken into consideration, the public institution can forestall the PPP from acting opportunistically with regard to what it charges for goods and services, because it is able to influence the PPP's monetary objectives.

Renegotiations are necessary if there are changes in the demand for the ordered goods and services or problems with their supply, or if there are changes in the customer's requirements. Overall, the reasons for renegotiations can be differentiated with respect to the party that initiates them. The analysis of Lohmann and Rötzel (2017) verifies that if the public institution initiates the process of renegotiating its agreement with an institutionalized PPP, it can influence the outcome decisively and enforce its objectives, which include reducing the PPP's remuneration. In contrast, the PPP's private shareholders will be in a weaker position and any surplus the PPP might achieve is unlikely to be transformed into profit they can benefit from. However, if it is the institutionalized PPP that initiates renegotiations, probably at the request of its private shareholders, the latter can influence the outcome to their advantage. Thereby, the effect that the initiator has on the outcome of renegotiating the remuneration is moderated by the degree of contract specificity and the existence of a decrease in demand as the main reason for initiating renegotiations. When contract specificity is low and/or a decrease in demand prompts the public institution to initiate renegotiations, this party is able to achieve a greater reduction in the PPP's remuneration than it would be otherwise. When the same conditions prompt the PPP to start renegotiations, however, this party is able to secure higher remuneration. As a result, Lohmann and Rötzel (2017) provide empirical evidence that when the public institution initiates renegotiations, it is likely to conclude them successfully, reducing the remuneration of the institutionalized PPP and thus the profit of the private investor. This finding indicates that awarding public contracts to institutionalized PPPs rather than to private companies is more beneficial to a public institution.

## Conclusion

Institutionalized PPPs are increasingly popular ventures that enable public institutions to fulfill public tasks or subtasks with the aid of private partners. Research on institutionalized PPPs has established that using capital, competences, and know-how that come from the private sector increases efficiency in the production of goods and services that are demanded by the public or the public institution. Nevertheless, the questions of how the surplus of institutionalized PPPs is distributed and which of the partners involved benefit most from participating in an institutionalized PPP remain under-researched. To answer these questions, it is necessary to look closely at the roles of three parties, namely, the public shareholders, the private shareholders, and the customers or clients of the institutionalized PPP. While the public shareholder aims to achieve a desired level of public welfare funded by restricted public spending, the private shareholders aim to maximize their economic success, which is commonly measured in terms of profit. This conflict between the partners' interests affects the PPP's set of objectives, the initial negotiation and, to a greater extent, subsequent renegotiations, in which each party tries to enforce its objectives.

Differences in objectives between the institutionalized PPP and the public institution are a necessary condition for opportunistic behavior to occur. If there is congruence between an institutionalized PPP and the public institution with regard to objectives, both will act in the same way. In the reverse case, one party will pursue its objectives at the expense of the other party. The conflict of interests between public welfare and profit maximization, which can endanger the government's objectives, manifests itself in opportunistic behavior exhibited by the private suppliers that fulfil public or governmental tasks. However,

when the public institution is the main shareholder of an institutionalized PPP, it is able to shape that PPP's objectives. More specifically, the public institution can minimize the importance of monetary success targets like profit maximization and increase that of monetary efficiency targets like cost minimization. By establishing cost minimization as the PPP's top objective with respect to the production of goods and services that the public institution demands, it is possible to reduce this conflict of interest and to prevent disproportionately high charges for the supplied goods and services.

The outcome of renegotiations depends largely on whether the PPP's customers are a third party (e.g., citizens) or the public institution itself. In the first case, the private partners can often exploit the PPP's monopoly over the goods or services it provides and the third party's dependence on the PPP. This enables them to use renegotiations with the public shareholder to achieve more favorable conditions, at the expense of the third-party customers, who will have to pay more or cope with reductions in the services or goods the PPP provides. It is important to point out that if the public institution simultaneously acts as the PPP's major shareholder and as the major or even sole customer, this will affect both the bargaining power of the parties involved and the outcome of renegotiations. In such cases the public institution plays a dominant role in renegotiations and is able to decrease the PPP's remuneration to save funds. This, however, will reduce the PPP's and, as a consequence, the private investors' profit.

Studies on institutionalized PPPs and their public clients provide evidence that delegating public or governmental tasks to institutionalized PPPs, rather than solely to private business partners, enables the public sector to use the capital, competences, and economic efficiency of private partners without running the risk of having to cope with unfavorable charge structures. This is especially the case when the public institution that acts also as a major client of the PPP initiates or at least controls the renegotiation process. From the perspective of private investors, joining an institutionalized PPP in which the public institution is also the major customer does not seem particularly profitable, because their bargaining position is likely to remain weak during the PPP's lifetime. To safeguard their financial objectives, the private shareholders need to influence actively the PPP's decision-making processes and to avoid entering renegotiations that the public partner has initiated in response to lower demand for the PPP's products or services. Nevertheless, in the case of institutionalized PPPs the public institution can exert a degree of control over their behavior through the demand for goods and services, through regulatory requirements, and through having a share in the institutionalized PPP. In this context, institutionalized PPPs prove to be more beneficial than private companies to the public institution, because the latter, as a major shareholder, has the opportunity to influence the behavior of such PPPs and control their objectives, decisions, and activities, which is much harder to do in the case of private companies.

# Relationship Building Among Stakeholders in Public Private Partnership Projects

Rogers Mwesigwa and Isaac Magoola Wanzige
Department of Business Administration, Makerere University Business School, Kampala, Uganda

## Synonyms

Collaboration; Cooperation; Partnership creation; Relationship development; Relationship management

## Definitions

Relationship building refers to the process of developing social connections among the project stakeholders.

Stakeholder engagement refers to the practice of stakeholders being involved in different project activities.

Stakeholder trust refers to as the stakeholders' belief that another stakeholder will perform actions that will result in positive actions to the project, as well as not take unexpected actions that would result in negative outcomes for the project.

Stakeholder communication refers to the practice of stakeholders exchanging information with others for mutual benefit.

Stakeholder commitment refers to the state or quality of stakeholders being dedicated to the project. It is the practice of stakeholders being emotionally attached to the project.

## Introduction

Building relationships with their stakeholders is vital in public private partnership (PPP) projects. The significance of project stakeholder relationships has and continues to be of interest in the project studies literature (Mwesigwa et al. 2020). Relationship building has become a key component in the practice of projects' public relations. This is because successful relationships between the project and its stakeholders are vital for successful delivery of projects and meeting stakeholder expectations. Building strong relationships with stakeholders is vital for the successful delivery of PPP projects. Karlsen et al. (2008) earlier noted that building stakeholder relationships is an important key to project success. Mwesigwa et al. (2018) note that projects that engage stakeholders and communicate with them regularly build better relationships than those that do not. By building positive relationships with stakeholders, they become happier, more fulfilled, and feel more supported, and connected. Building stakeholder relationships is also inevitable due to the uncertainty caused by the increasing scale and complexity of PPP projects. Thus, failure to develop strong relationships among stakeholders may result into mistrust, tension, conflicts, and dramatically increase the complexity of the situation as well as making the possibilities for future successful relations much more difficult. According to EL-Gohary et al. (2006), in order to minimize stakeholder opposition, it is important for projects to build strong relationships among stakeholders.

## Relationship Building Practices

Relationship building practices such as stakeholder engagement, trust, commitment, and communication have have been taken into consideration as explained below.

## Stakeholder Engagement

Mwesigwa et al. (2018) conceptualized stakeholder engagement as process by which a PPP project engages stakeholders who may be affected by the decisions it makes or can influence the implementation of its decisions. When stakeholders are involved at the project planning, design, and implementation, their ideas and concerns are incorporated and addressed. Magoola et al. (2021) stated that involving stakeholders in

planning, designing, and implementation processes helps in setting of clear project priorities, reducing conflicts, and minimizing disagreements among stakeholders. Stakeholder involvement thus provides opportunities to align project practices with societal needs and expectations, helping to drive long-term sustainability and shareholder value. It also builds stakeholders commitment and a feeling of ownership and belonging to the project. Magoola et al. (2021) noted that stakeholder engagement enhances mutual understanding with other stakeholder groups, thus reducing potential conflicts and promoting effective cooperation. Involving stakeholders develops an environment of trust which is key for relationship building. Stakeholder participation in project activities results into building consensus through bringing together a diverse range of stakeholders to share needs, information, ideas, and knowledge and harmonize the objectives of individual groups to reach common societal goals.

Involving stakeholders on an extended level in project activities is necessary within a management for stakeholders approach. Otherwise it would not be possible to really get to know their requirements, needs, wishes, and concerns. Ayuso et al. (2011) had earlier considered stakeholder engagement as an organizational capability which allows the firm to build strategic relevant relationships with their stakeholders. They further noted that firms which engage in proactive relationships with their stakeholders will also be able to integrate the gained stakeholder insights into their process of organizational innovation from a sustainable development viewpoint. Involvement of stakeholders enables organizations to identify and incorporate their material concerns, issues, perceptions, needs, and expectations. Quality stakeholder engagement in the sustainability reporting and accounting process generates creative solutions to address stakeholders' concerns, increasing responsiveness, transparency, and accountability (Brown and Hicks 2013).

Whereas Brown and Hicks (2013) noted that stakeholder engagement enhances mutual understanding and encourages relationship building, Kaur and Lodhia (2018) noted that it is regarded as an essential component of the accounting and reporting process which assists in collecting information about the community's needs and expectations and incorporating them in the sustainability initiatives. Organizations can no longer choose if they want to engage with stakeholders or not; the only decision they need to take is when and how successfully to engage. In today's society, if stakeholders are not actively sought out, sooner or later they may demand to be consulted which will lead to a significant and long-lasting loss of reputation and damaging of trust.

## Stakeholder Trust

When building good relations with different project stakeholders, trust is an important ingredient (Karlsen et al. (2008). Stakeholders trust is generally believed to be important for the success of stakeholder relationships. Trust is important in relationship building because it is the basis through which all stakeholder relationships revolve. It is the glue that holds stakeholder relationships together (Jeffries and Reed 2000). It is vital to build good relations with the stakeholders who are identified as trustworthy. Firms that create and sustain stakeholder relationships based on mutual trust have a competitive advantage over other firms that do not act in that way. Trust is seen as an essential for stable relationships, vital for the maintenance of cooperation, fundamental for any exchange, and necessary for even the most routine of everyday interactions. When stakeholders are perceived to be reliable, execute their tasks on time, mutual understanding is built. Mwesigwa et al. (2020) note that when stakeholders trust each other, they can easily interact, share information, and in the long run it leads to building of strong relationships. For instance, when the project believes that stakeholder actions are free from doubt and honest, it will endeavor to build relationships with them. Collaboration and consultation becomes possible whenever stakeholders are perceived to be reliable. Magoola et al. (2021) observed that when stakeholders are perceived to be dependable, the project will always endeavor to reward them by meeting all their interests and

expectations. Under conditions of trust, stakeholders may be more willing and comfortable to reveal private or sensitive information to the project because they believe that the information provided will not be used against their best interests. Yin-Hsi Lo (2013) noted that trust plays an integral part to managing stakeholders, recognizing their needs and expectations, and maintaining and developing a close relationship with them.

In public private partnership projects, presence of trust can reduce the specification and monitoring of contracts, provide material incentives for cooperation, and reduce uncertainty. Trust reduces the uncertainty of the actions of other parties because parties already know what they can expect from each other (Edelenbos and Klijn 2007). Trust established among stakeholders is one of the fundamental resources that projects can make use of in order to control complexity. According to Moorman et al. (1993), trust is the willingness to rely on an exchange partner in whom one has confidence. Trust has a notion of belief, a sentiment or an expectation about an exchange partner that results from a partner's expertise, reliability, and intentionality. Morgan and Hunt (1994) find that trust is central to strengthening relationship with stakeholders. If the trust between the parties is believed to be strong, the cooperation between the parties tends to be long term. If the trust is high between the parties, conflicts that arise between the parties could be more of a functional kind. The uncertainty seems to decrease as a consequence of high trust between the parties.

## Stakeholder Commitment

Morgan and Hunt (1994) conceptualized commitment as "an exchange partner believing that an ongoing relationship with another is so important as to warrant maximum efforts at maintaining it; that is, the committed party believes the relationship is worth working on to ensure that it endures indefinitely." Mwesigwa et al. (2020) opined that when stakeholders are devoted to the project, the project can easily create a conflict-resolution channel and through this, any issues arising from stakeholders can be handled. Stakeholders who are committed to the project truly believe that it is important, and they show up, follow through, and stick with it. This forces the PPP project to try not to disappoint them by meeting their interests and expectations. When stakeholders are dedicated to the project, working together to achieve a common goal becomes possible. Stakeholders dedicating their time and energy to what they believed in increases relationship building and project success.

Yin-Hsi Lo (2013) noted that stakeholder commitment plays an integral part to managing and recognizing their needs and expectations. Meyer and Allen (1997) had noted that when stakeholders are emotionally attached to the project, recognize the benefits of continued association with the project compared to the perceived cost of leaving the project, and have the feeling of obligation to remain in the project, they are always rewarded for their actions and commitment.

Mwesigwa et al. (2020) further provide that when stakeholders are devoted to the project, their interests and expectations are always met by the project. This suggests issues and concerns of committed project stakeholders are always satisfied because they more often do not have intentions to quit, which saves the project the costs of recruiting and orienting new stakeholders in terms of both time and money. Costs of supervision are mitigated if the project stakeholders are committed to their project activities.

## Stakeholder Communication

It is crucial to establish good communication channels with stakeholders, both internal and external by setting clear communication goals and ensuring that there is an effective flow of information to and from the stakeholders (Manowong and Ogunlana 2010). The stakeholders may feel satisfied if only they have access to substantial project information. Mwesigwa et al. (2018) found that communication is vitally important to building relationships among stakeholders. When stakeholders are kept informed of project decisions and expectations on time,

relationship building is enhanced. Free flow of communication among stakeholders quickens feedback and there is an understanding of what is being communicated and in the end monitoring of stakeholder activities became possible. Effective communication creates, shapes, maintains stakeholder relationships, and endorses mutual understanding between the project and its stakeholders. Stakeholders need to continuously get information from the project because they are the people and organizations whose attitudes and actions have an impact on the success of the project.

Osei-Kyei et al. (2018) further noted that it is important for project parties to establish an effective and efficient communication mechanism for PPPs if they are to achieve the intended objectives. Communicating with stakeholders regularly and establishing long-term stakeholder relationships are considered as critical for successful management. Communication between the stakeholders can help in facilitating the exchange of ideas, visions, and overcoming difficulties. From the above, it is noted that effective communication is a vital component in the process of building and maintaining relationships, and is essential for maintaining support, commitment, and interests of all stakeholders.

## Indicators of Relationship Building

Mwesigwa et al. (2018) attempted to operationalize relationship building to mean the ability to build and maintain relationships with the stakeholders. When relationships are built among stakeholders, their interests and expectations can be easily identified and addressed. Relationship building can be understood using four dimensions that is stakeholder communication, stakeholder engagement, stakeholder trust, and stakeholder commitment. These scholars developed items to measure the four indicators of relationship building. The questions developed were anchored on a six-point Likert scale, ranging from 1 – strongly disagree to 6 – strongly agree. They argue that African respondents tend to tick or answer the not sure/middle point which is avoided here with the six-point Likert scale. The measurement items were subjected to both validity and reliability tests. The Cronbach alpha coefficient results for the constructs were: stakeholder communication = 0.837, stakeholder engagement = 0.870, stakeholder trust = 0.856, and stakeholder commitment = 0.791, respectively. All exceeded the minimum acceptance value of 0.70. Content validity was determined by giving the instruments to six respondents who were experts and practitioners in the field of relationship building in public private partnership projects. The researchers in that study went on to perform EFA by running principal component analysis as the extraction method using Varimax with Kaiser Normalization to explore factor structure of the study constructs. This helped to summarize variables from the constructs with multiple questions into more meaningful and interpretable factors. Besides, EFA also enabled those scholars to test for validity of the study items. After performing EFA on that data, CFA was carried out to construct the CFA models. Only those dimensions and respective items that were retained at EFA were used to carry out a CFA using analysis of moment structures (AMOS). Based on that study, all the dimensions are the indicators of relationship building in public private partnership projects in Uganda.

## Conclusion

All the four dimensions are key indicators of relationship building in PPP projects. PPP projects need to engage, have trust, and communicate with the committed stakeholders if they are to build strong relationships and succeed in a developing country's perspective. This study implies that once there is effective communication among stakeholders, relationship building becomes possible. Also, as long as stakeholders trust each other and there is high level of commitment, relationship building in PPP projects is enhanced. Lastly, when stakeholders are engaged in project activities, relationship building becomes easy. This is because constant interactions among stakeholders lead

to collaboration, cooperation and relationship development.

# Religion and Nonprofit Organizations

Johny T. Garner
Bob Schieffer College of Communication, Texas Christian University, Fort Worth, TX, USA

## Synonyms

Church; Mosque; Religion; Religiosity; Spiritual; Spirituality; Synagogue; Temple

## Definition

Church: An organization that exists for the purpose of promoting its faith and maintaining or growing religious values in its members with the goal of attaining salvation.

Faith-Based Nonprofit Organization: A nonprofit organization that includes explicitly religious values as part of its mission or practice and attributes those values to a religion.

## Introduction

Until recently, nearly all organizational research focused on businesses. The nonprofit section in this encyclopedia demonstrates that nonprofit organizations are increasingly included in organizational scholarship. One type of nonprofit organizations that has received only limited attention is churches (a term that is used here to describe Christian churches along with temples, synagogues, mosques, and other places of worship). Along with faith-based nonprofit organizations, these entities are distinct in that religious values play an explicit role in the mission and/or practices of the organization. This entry overviews some of the potential organizational dynamics that contribute to the uniqueness of these organizations, first by reviewing churches and then by considering faith-based nonprofit organizations other than churches.

## Churches

Churches are organizations that exist for the purpose of promoting their faith and maintaining or growing religious values in members. The ultimate goal of those pursuing those values is to attain salvation. Whereas businesses exist to increase profit and other nonprofit organizations strive to meet a variety of needs defined by their mission, churches, regardless of their faith tradition, exist to expand their membership while maintaining current members' beliefs. As such, churches differ from other organizations in at least two important ways: membership and authority. The next sections explore these distinctions in more depth.

The most obvious way in which churches are distinct from other types of organizations is their mission. Churches exist to extend their values to new populations and to maintain those values in current members. The mission of churches shapes practices in a variety of ways. For example, Sturgill (2004) studied church websites and found that some focused more on outreach (extending values to new populations), some focused more on organizational development (maintaining values in current members), while still others tried to strike a balance between the two goals. Churches' missions will shape worship practices and educational programs as well.

That mission also defines what it means to be a member, which is a second area in which churches differ greatly from many other types of organizations. Businesses use employment as the basis for membership, such that one's membership in a business organization typically begins when one begins employment at the business and ends when that employment ends. Membership in churches might more closely relate to volunteering in a nonprofit organization, except that new members in churches are generally expected to make a more definitive commitment of faith to the religious tradition of the church. Church members, more than employees in businesses, are expected to internalize prescribed values. One might also expect many of their friend and family ties to overlap with church membership. Indeed, as individuals join a church, one of their primary expectations is for relationships (Taylor et al. 2015).

Such entanglements can make exiting a church particularly complicated. Whereas employees experience a moment of detachment where they are no longer part of an organization, church members may or may not have such a moment. Instead, church members may leave through a "slow fade," as they begin to de-identify with a particular church, stop attending services and events, and transition to a life apart from that particular church. Such a process could happen quickly or it could take months or even years. This gradual exit process may seem tranquil or passive from an external perspective, but it could be filled with tremendous internal conflict for a member who is exiting. Primary within that internal conflict could be a calculus of the reasons for staying versus the reasons for leaving. For example, a member's social and familial ties may lie within the church (Hinderaker 2015). Exiting the church could sever those ties. Beyond that, there is a certain inertia that keeps members in churches even as they contemplate leaving. Church participation can be a significant part of one's life, and the thought of replacing that activity could inhibit exit. At the same time, the member may feel staying in the church is untenable due to conflict with an authority figure or disbelief in the church's doctrine. As a result of this internal conflict, exiting members may second guess themselves, and the exit process itself could be drawn out and include one or more "attempts" at exit before the member finally leaves. Such attempts could involve ceasing attendance and even attending other churches but ultimately returning. This process is certainly different from what one would expect in an employment setting.

A third area in which churches differ from other types of organization is leadership, specifically the authority of church leaders. Campbell (2007) identified four sources of authority in churches: hierarchy, structure, ideology, and text. Hierarchical authority includes leadership associated with a particular role. Structure includes the practices of church organizations. Ideology includes a church's religious beliefs and values,

while the text refers to the authority of the Bible or other religious writings. While structure is common to all organizations, the specific examples of structure to which Campbell refers (e.g., worship practices) are unique to churches. Similarly, while all organizations espouse ideologies, the ideologies of churches center on uniquely religious values. However, the other two sources of authority particularly distinguish churches from other organizations. Other organizations may have manuals or handbooks but rarely do they invest the kind of authority that churches bestow upon scriptures.

In terms of hierarchical role authority, Foucault (1978) explained that, because pastors' authority came from their interpretation of Scriptures, their power was particularly potent. Foucault argued that metaphors such as shepherd and sheep tend to reinforce unquestioned allegiance to pastors. While members have the ability to join or leave at will due to their voluntary membership, pastors' use of Scripture provides a lens through which church leaders can shape how members see the world around them (Armfield et al. 2006). For example, Armfield et al. suggested that pastors' discourses regarding appropriate Internet usage would shape the ways church members engaged technology. That might be particularly true when crises develop. Dixon (2004) described how the Catholic Church (specifically the American dioceses) was more interested in reaffirming its authority than in repairing its public image after the sex scandal in the early 2000s. Dixon's analysis focused on public statements by church leaders which, while focused on reconciling with victims of the crisis, were equally concerned with reestablishing that leaders are the arbiters of truth in the face of dissenting voices. Hall (2007) found that church members typically had a view of church leaders that emphasized spiritual discernment but was naïve of church politics and authority (although church leaders were particularly aware of political alignments in their churches).

At the same time, church leaders' authority is not monolithic because of voluntary membership. McNamee (2011) studied the ways in which churches make decisions. She found that, while it was true that spiritual reasoning and pastoral authority formed the basis for some decisions, many decisions were based on secular reasoning and fiscal concerns. These decision making premises move authority from solely under the pastor's role to members more broadly as lay members may have as much expertise in secular reasoning and finances as clergy. Other research has noted that church members share stories of leadership to equalize decision making (Hoffman 2002). Brenton (1993) presented a case study of leadership in an American Protestant church. When leaders' authority was unobtrusive, that is, when members did not think about how leaders lead, their control was strong. However, Brenton recounted a conflict where leaders exercised overt power. As their control became obvious and as members realized that they had little voice in decision making, many members left the church to attend elsewhere.

Particularly in contemporary society, church members expect a voice in decision making, which results in a contrast between divine authority and democratic processes. Garner (2016) noted that these were not necessarily opposed as members may see divine guidance as manifested through members' voices. Garner conducted focus group interviews and collected surveys from members in a variety of denominations. He found that members expected their voice to be heard since they saw themselves as "bosses" by virtue of their voluntary membership. At the same time, they trusted theological decisions to be made by church leaders and assumed that church leaders were inspired by God.

## Faith-Based Nonprofit Organizations

As previously mentioned, churches differ from other organizations although many nonprofit organizations include religious values. The inclusion of explicitly religious values in a nonprofit organization's mission or practice and the attribution of those values as grounded in religion separate faith-based nonprofit organizations from secular nonprofit organizations. Faith-based nonprofit organizations include religiously affiliated universities as well as nonprofit organizations

dedicated to meeting a variety of needs such as shelter for the homeless, food/clothing for disadvantaged populations, free or reduced price health clinics, and after school services. While a few of these need-fulfillment organizations are larger (e.g., Catholic Charities and Salvation Army), most are local, grassroots organizations. Both religiously affiliated universities and need-oriented nonprofits can vary in terms of the degree to which their religious values shape day-to-day practices.

As one might imagine, faith-based nonprofits can bear striking similarities to churches. Indeed, some nonprofits are even started by churches. For example, a church might decide to organize its benevolence ministry as a separate nonprofit organization. The church as a whole and potentially some members provide money and guidance, but a separate staff directs the functions of the organization. However, despite similarities, recall that churches exist only to spread and deepen religious values to attain salvation, while faith-based nonprofit organizations meet a variety of needs. Churches may fulfill those needs as part of their religious values (i.e., a church pantry for disadvantaged populations) but that fulfillment is secondary to the church promoting/maintaining its religious value. Likewise, a faith-based nonprofit organization may include a devotional in periodic staff meetings, but such a devotional is secondary to meeting the needs of its target population. A religious university may require students to attend a chapel service, but such services are offered as only part of the educational process for which students are attending the university. These contrasting purposes are often manifested in different organizational practices: church practices are dominated by worship services and educational programs, while faith-based nonprofit organizations are more focused on the day-to-day operations of their mission.

That being said, faith-based nonprofit organizations also differ from secular nonprofits. The most prominent way in which faith-based and secular nonprofits differ is the inclusion of faith statements in mission statements. Faith-based nonprofits may have explicit mention of their religious values in a mission statement, a vision, or in the discourses of the organization while such language would almost certainly be absent from secular organizations' missions, visions, and discourses.

A second way in which faith-based and secular nonprofit organizations differ may be in the expectations for relationships. Everyone expects to build relationships with their coworkers. However, because of the inclusion of religious values in organizational discourses and because many times religious values encourage love and kindness, members in faith-based nonprofit organizations enter the organization expecting loving relationships. These members may be surprised by examples of office politics and fiscal realities that are part of almost any organization. For example, employees of a faith-based nonprofit organization might be particularly surprised by squabbling between departments since the entire organization would be united by religious sentiments. Likewise, it would be difficult to reconcile firing an employee (even for inferior performance) if the organization's values emphasize mercy and grace.

Finally, faith-based nonprofit organizations differ from secular organizations in their use of spiritual rationalities to make decisions. As previously mentioned, churches use both secular and sacred bases for decisions, and faith-based nonprofit organizations can be similar in that regard. Garner (2015) recounted a nonprofit executive director describing how God had directed him to explain the organization's vision to their board. Such a revelation might be inappropriate in a secular nonprofit organization but was accepted within this faith-based organization. Members in these organizations are able to make use of spiritual reasoning for decision making.

## Heuristic Directions

Those spiritual rationalities represent one important heuristic direction for research on religion and nonprofit organizations. Previous research has explored instrumental rationalities (i.e., decisions

based on logical reasoning; Harter et al. 2008) or emotional rationalities (i.e., decisions based on feelings or emotions; Mumby and Putnam 1992). By contrast, organizational members in churches and faith-based nonprofit organizations, while also relying on those decision premises, base decisions on spiritual principles and what they believe to be divine guidance. McNamee (2011) found as much in churches as she noted sacred and secular justifications for decisions. It would be particularly interesting to explore spiritual rationalities in faith-based nonprofit organizations, essentially seeking to understand the "faith" in faith-based nonprofit. These organizations interface with donors, partners, and clients who may not share their religious values, creating the potential for some to discount spiritual rationalities. Along this line, some faith-based nonprofit organizations place more emphasis on religious values in their mission than do others. Some faith-based nonprofit organizations are tied to specific churches or denominations while others are not. These interorganizational ties likely affect the organization in deep ways. Future research might explore the ways in which the religious values of the organization shape decision making.

Another avenue for research is exploring the influence of denominational structure on the practices of the local congregation. In the Roman Catholic Church, many non-Christian religions, and a number of Protestant churches, the local congregation has some control over its day-to-day functions, but it reports to a regional, national, or international authority for doctrine and potentially even hiring decisions. Some research has explored national structures (e.g., Dixon 2004), while other research examined the local congregation (e.g., Garner 2016), but little research has studied the intersection of the two. Such scholarship could unpack the ways in which the national structure shapes the local but also how the local resists or reconstitutes the national or international authority.

Perhaps the most prominent way in which church members have a voice in decision making is through committees. While group and organizational researchers have studied workgroups in businesses, few have examined the group dynamics of churches. These committees are comprised of voluntary members. In some cases, this could lead to increased commitment to the group, since members are self-selecting on to these committees. In other cases, committee members might be less committed than one would expect since they are fulfilling this role in addition to work and family responsibilities. Members' differences in religiosity and any subtle differences in theology would also affect the group.

Finally, future research might continue to explore what it means to be a member of these organizations. As previously mentioned, while employment organizations have cleaner lines of who is and who is not a member, churches (and to some extent, nonprofit organizations more broadly that rely on volunteers) have much more fluid lines of membership. Scholarship is needed exploring the boundaries of membership, answering questions such as who is a member, when does membership begin, and when does membership end.

## Global Context

Unfortunately, most of the research on churches and faith-based nonprofit organizations has been conducted in the United States. While nonprofit organizations (often called nongovernmental organizations or NGOs outside of the United States) are active around the world, little research has been published in English-speaking outlets exploring churches and faith-based nonprofit organizations in global contexts. One would expect some characteristics such the inclusion of religious beliefs in mission statements to remain constant. On the other hand, leadership and relationship expectations might vary significantly from one culture to another. Similarly, even as defining characteristics of religious organizations remain constant, the look and feel of those organizations would differ dramatically based on the predominant religion of the area. Much more research is needed to explore churches and faith-based nonprofit organizations in non-US contexts.

## Conclusion

This entry defined churches as organizations that exist for the purpose of promoting their faith and maintaining or growing religious values in members where the goal of membership is to attain salvation. There are three primary differences between churches and other types of organizations: mission, membership, and leadership. The entry also discussed faith-based nonprofit organizations, which include explicitly religious values in mission or practice and then attribute those values as religious belief. Such organizations include religiously affiliated universities and need-fulfillment nonprofit organizations. Faith-based nonprofit organizations differ from secular nonprofit organizations in that they include faith in their mission, members often have higher expectations for loving relationships, and people in the organization often use spiritual rationalities to make decisions.

# Religious Organizations

Julia Berger
Department of Religious Studies, University of Kent, Canterbury, Kent, UK

## Synonyms

Faith-based organizations; Faith-inspired organizations; Religious nongovernmental organizations (RNGOs)

## Definition

Religious organizations are organizations whose identity and mission are derived from a religious

or spiritual tradition and which operate as registered or unregistered, nonprofit, voluntary entities.

## Introduction

Religious organizations are among the oldest associations: Sufi and Catholic orders, and Buddhist Sanghas, carried the teachings and practices of their respective faiths across diverse regions long before the notion of "religion" came to signify a separate domain within human life. Today, despite predictions that modernity would push religion to the margins, religious communities continue to grow and to exert a major influence on society. The Pew Forum on Religion, in its 2012 study of global religious demographics, reported 2.2 billion Christians, 1.6 billion Muslims, one billion Hindus, nearly 500 million Buddhists (7%), and 14 million Jews around the world as of 2010 (The Pew Forum on Religion and Public Life 2012). (Over 400 million people practice folk or traditional religions, 58 million belong to other religions, and 1.1 billion do not identify with a particular faith, although they may hold religious or spiritual beliefs.)

It is impossible to say how many religious organizations are in existence, in part because of the challenge of defining what constitutes a "religious" organization and, in part, because many organizations are not formally registered. For the purposes of this article, "religious organizations" are defined as organizations whose identity and mission are derived from a religious or spiritual tradition and which operate as registered or unregistered, nonprofit, voluntary entities. According to some estimates, there are millions of religious organizations active all over the world – ranging from the smallest, local unregistered groups to professional organizations with billion-dollar budgets and a transnational infrastructure.

In this complex organizational universe, it is possible to distinguish among different types of organizations, such as: (a) authoritative and representative organizations (e.g., Vatican), (b) charitable and development organizations (e.g., Salvation Army), (c) sociopolitical organizations and movements (e.g., Organization for Islamic Cooperation), (d) missionary organizations, and (e) illegal and/or violent organizations. (Clarke et al. 2008). While religious organizations have generally been associated with the provision of social services and humanitarian relief, in the past several decades, they have increasingly injected their voices into the domains of advocacy, policy, and decision-making at the highest levels. Issues of particular concern have included: the rights of women, social and sustainable development, conflict resolution and peace, migration inequality, and freedom of religion, to name a few. The blurring of the divide between religion and politics has challenged long-held assumptions about the place of religion in the public sphere and raised awareness of the varieties of "church-state" arrangements that give rise to different roles of religious organizations throughout the world.

## The Changing Role of Religion in the Modern World

The study of religious entities in contemporary society has been largely shaped by the "secularization theory," which predicted that as societies modernize, religion will lose its ability to influence thought and behavior and will be limited to the private sphere. Yet, rather than retreating into irrelevance, religious organizations, institutions, and movements have asserted their presence at all levels of society. In the domain of politics, movements such as the Iran Revolution of 1979, the Catholic Church's support of the Polish "Solidarity" movement, the rise of the Christian Right in the USA, and the September 11, 2001, attacks on the World Trade Center have challenged commonly held notions of the role of religion and its influence in the modern world. The theory of secularization, now considered a poor guide to contemporary affairs, has also been contextualized in terms of its European and Christian roots. There is greater recognition that different historical trajectories, such as those in Hindu, Confucian, or Muslim societies, have produced diverse concepts of "religion" and "modernity." These, in

turn, have given rise to different varieties of religious organizations, institutions, and movements.

Today, the salience of religion and religious organizations in the public sphere is plainly evident. This includes their reach and influence in domestic and international affairs, in development and humanitarian aid, and the provision of social services. It also includes the rising tide of extremism, radicalism, and violence committed in the name of religion. A number of facilitating factors have supported the proliferation of religious organizations. The decline of communism and the end of the Cold War revitalized civil society and gave rise to the emergence of new kinds of identities and modalities for collective action; in the USA, the Christian Right gained strength in the 1970s and became increasingly influential in shaping domestic and foreign policy; the United Nations global conferences of the 1990s galvanized religious actors and organizations (as well as secular ones) and set the stage for the emergence of transnational civil society; mounting moral outrage at the growing levels of inequality and poverty worldwide spurred religious organizations to action; and, in the face of weak and corrupt administrations, religious organizations scaled up their long-standing tradition of providing humanitarian aid and social services. In addition, globalization and communication technology have greatly facilitated coordination and advocacy efforts and made it easier for both peaceful as well as violent groups to organize. Today, eight out of ten people identify with a religious or spiritual tradition. Increasing membership in organized religious groups has also led to a growing number of resources being channeled to religious organizations.

Changes within religious communities themselves have also shaped the nature of religions' engagement with society. The Second Vatican Council, from 1962 to 1965 ("Vatican II"), which addressed relations between the Roman Catholic Church and the modern world is one such example. It was a central factor in the development of Liberation Theology in Latin American and spurred the Church to engage more actively in public debates on war, peace, human rights, and other social justice issues. *Gaudium et Spes* ("The Church in the Modern World"), a seminal document produced by the Council, gave specific recommendations regarding the nature of the Church's engagement in the life of society. Vatican II also prompted the creation of new Catholic organizations that would take up the call to realize the mission of the Church in the modern world.

## Defining Religious Organizations

The task of defining a "religious" organization is an elusive one; there is no single agreed-upon definition of "religion." For the purposes of this entry, religious organizations are defined as organizations whose identity and mission are derived from a religious or spiritual tradition and which operate as registered or unregistered, nonprofit, voluntary organizations (Berger 2003). Millions of organizations around the world could be included in this category, including: the Vatican, a local chapter of the Salvation Army, a Muslim school, a Hindu political party, a Jewish advocacy organization, and the like. Included in this category are also organizations that prefer the designation "spiritual" and/or "movement" rather than "religious," such as the Brahma Kumaris World Spiritual Movement (a female-led movement, founded in India). As there are no universally accepted objective parameters for defining a religious organization, the self-identity of the organization serves as a useful guide.

The decision as to whether an organization is "religious" can have significant practical and legal implications for fundraising efforts, tax status, and public perception. The difficulty and consequences of designating an organization as "religious" are illustrated by the protracted conflict between the Church of Scientology and the United States Internal Revenue Service (IRS). For decades, the IRS sought to determine whether the Church of Scientology and its affiliates constituted a "church" and satisfied the criteria for tax exemption as a "religious" organization. IRS criteria included: existence of a religious doctrine, religious literature and history, ordination of ministers, and a religious community. In 1993, the IRS finally granted tax-exempt status to the organization and its 150 affiliated churches, missions,

and social welfare organizations. Attention must also be given to the entity formulating the definition (e.g., government body, academia, development agency, religious institution) and what purpose such a definition serves (e.g., qualification for tax exemption, legitimacy, etc.).

Commonly used terms used to describe religious organizations of various kinds include: faith-based organizations, faith-inspired organizations, and religious nongovernmental organizations (NGOs). The term "faith-based organization" is commonly used as it is considered more inclusive entities that do not affiliate with a particular religion (e.g., World Peace Prayer Society). The term is also more inclusive of humanitarian and relief-focused organizations while the "NGO" designation tends to imply more direct engagement with advocacy and policy processes. Terminology also varies in different contexts; for example, "religious NGO" is the used term by the United Nations, while "faith-based organization" is typically used by national governments and development agencies.

From a global perspective, it is also important to consider that the term "religious" organization comes out of a particular philosophical stance, which draws a dividing line between the religious and secular dimensions of human life. As this is not a universal philosophy or way of understanding and organizing society, it may be that an organization which appears to be "religious" from the perspective of one observer may not be labeled as such by its members.

## Typologies of Religious Organizations

Given the tremendous diversity of religious organizations – in terms of religion, resources, membership, mission, geographic spread, etc. – it is helpful to organize these according to a typology. The following typology draws on categories proposed by various authors e.g., Clarke et al. (2008); Marshall (2013):

(a) *Authoritative and representative organizations*
Organizations in this category have an authoritative status within their respected religious community. They rule on doctrinal matters and represent religions in their engagement with the state other representative actors. Examples include: the Vatican, the Buddhist Sangha, the Anglican Communion, the Imamate of the Ismaili community, and the Universal House of the Justice of the Bahá'í community. Many of these structures extend from the local to the global and tend to be hierarchically organized. However, many religious traditions are decentralized with no single body authorized to speak on its behalf (e.g., Muslim, Hindu communities). These organizations may also include global interreligious or ecumenical bodies such as Religions for Peace, Parliament of the World's Religions, and the World Council of Churches.

(b) *Charitable and development organizations*
These include funding or managing programs that engage in what can be broadly called "development" and social justice. These organizations provide social services, such as education, health care, nutrition, humanitarian relief, etc. – particularly in the absence of functioning domestic entities. Examples include: American Friends Service Committee, Salvation Army, Care International, Caritas International, Christian Aid, Church World Service, Islamic Relief, Lutheran World Federation, Musawah, and World Vision International. They range from international structures to informal, unregistered organizations at the community level.

(c) *Sociopolitical organizations and movements*
This is a highly diverse group, which includes political parties, social movements, and cultural organizations. Organizations in this category include: religious organizations ("NGOs") active at the United Nations, the European Union, and the World Bank; political parties (e.g., Hindutva, a Hindu nationalist party in India; Shas, an ultra-orthodox Jewish party in Israel), and the Organization for Islamic Cooperation. Social movements in this category include the Community of Sant'Egidio, Opus Dei, and Ahmadiyya, among others.

(d) *Missionary organizations*
These organizations actively promote the teachings and worldview of their respective religion and may also engage in charitable work. Examples include: Campus Crusade for Christ and Youth with a Mission.

(e) *Radical, illegal, or violent organizations*
Groups in this category generally promote and/or engage in militant and violent acts justified on religious grounds. While such groups exist within most if not all religious communities, in the past several decades, many have used the teachings of the Qur'an to justify their actions (e.g., Al Qaeda, Hamas, ISIS (or "Daesh"), Jemaah Islamiyah, Muslim Brotherhood).

Other religious organizations not captured in this typology include unregistered community and congregation-level groups such as women's and youth groups, which may be among the most widespread religious organizations. Religiously linked academic institutions, such as Union Theological Seminary, Hebrew Union College, and Al-Azhar University, that train future religious leaders and scholars, are also a type of religious organization. The above categories need not be seen as discrete as some religious organizations may straddle more than one category.

Given the tremendous diversity of religious organizations, this entry focuses primarily on types (b) and (c): charitable and development organizations and sociopolitical organizations and movements.

## Religious Organizations in the Field of International Development and Advocacy

Until recently, religious organizations in the field of development were largely ignored in academic and public policy circles. The notion of development was closely associated with concepts of "modernity" and "secularization" and, as such, deemed religion as irrelevant and harmful at best. In addition, most development agencies worked predominantly with governments as it was expected that governments would play a primary role. Yet long before the concept of "development" assumed such prominent status in the international community, missionary ventures and religiously inspired initiatives were at the forefront of providing essential social services to underprivileged and marginalized populations in many parts of the world. In 1947, the Nobel Peace Prize was jointly awarded to two Quaker organizations – the Friends Service Committee in London and the American Friends Service Committee in Philadelphia – for humanitarian service and dedication to peace. Since the 1980s, the combined impact of globalization and the failure of many secular development approaches (e.g., structural adjustment programs, market deregulation, "trickle down" economics) to improve social and economic well-being have spurred the search for more holistic approaches to development – those that take into account the cultural, social, psychological, and spiritual dimensions of individuals and communities. And it is often to religious organizations that attention has turned.

Today, religious development organizations command major financial and human resources. World Vision International, for example, reported operating revenue of one billion dollars in 2015; Catholic Relief Services had revenues of over $721 million (2012); London-based Islamic Relief had $116 million (£82.8 million) in 2013; and Lutheran World Relief had $47,296,491 in 2014. An increasing number of (secular) international development agencies and Western governments have entered into formal partnerships with religious organizations recognizing their particular strengths – such as resources, the trust of local communities, and extensive geographic reach. Since the 1990s, religious organizations have become increasingly visible on the global stage: the Millennium World Peace Summit of Religious and Spiritual Leaders, which took place in the United Nations General Assembly Hall in 2000, signaled (if only symbolically) an evolving relationship between religious communities and the nations of the world.

While it is impossible to account for all of the contributions made by faith-based and religious organizations, the following estimates provide a

sense of the scope of their engagement. The World Health Organization, for example, estimates that 30–70% of the healthcare infrastructure across the African continent is owned or run by FBOs, with percentages varying within this range in different countries. (The first census in Africa on the not-for-profit healthcare sector conducted by Uganda in 2001, for example, showed that 70% of all private not-for-profit health facilities in Uganda are owned by autonomous diocese and parishes.) Further, a 2007 study found that over 50% of health and education programs in sub-Saharan Africa were implemented by FBOs. Between 2001 and 2005, over $1.5 billion was channeled through faith-based organizations by the US International Development Agency. In the USA, the Catholic Church is the largest nonpublic provider of human services to families living in poverty.

Recognizing this critical role, a growing number of partnerships are being established between intergovernmental and domestic governments and religious organizations, signaling a "new normal" in terms of government-religion relations. These include: formal partnerships between religious/faith-based organizations and UN agencies (e.g., United Nations Population Fund, UNICEF, UNAIDS), the World Bank (e.g., "The Moral and Spiritual Imperative to End Extreme Poverty" initiative), multi-stakeholder partnerships (e.g., International Partnership on Religion and Sustainable Development), and national governments (e.g., United States Agency for International Development, United Kingdom Agency for International Development, Swedish International Development Cooperation Agency, Norwegian Agency for Development Cooperation, etc.).

It is not only in the field of social services and humanitarian relief that religious organizations are playing a major role, they are also adding their voices to policy debates at national and international levels. Organizations such as the US Conference of Catholic Bishops, the American Jewish Committee, the Muslim Canadian Congress, and the Asian Muslim Action Network are among organizations whose mission involves a strong advocacy component.

A major example of this kind of advocacy can be seen among the religious organizations active at the United Nations. Religious organizations have engaged with the UN since the founding of the organization. The relationship is guided by Article 71 of the UN Charter which states that the UN's Economic and Social Council "may make suitable arrangements for consultation with on-governmental organizations, which are concerned with matters within its competence" and that such arrangements may be made with international organizations and, where appropriate, with national entities. Today over 4,000 non-governmental organizations (NGOs) are formally accredited to the UN through the Economic and Social Council. Of these, approximately 400 are religious organizations, as reported by the organizations themselves. The "consultative status" with the UN grants organizations access to UN deliberations (though not all) and UN conferences, allowing them to make oral and written interventions and, in some cases, to make recommendations for items to be included on the UN's agenda. The concerted, and at times disruptive, lobbying efforts of religious organizations at major UN conferences, such as the 1994 International Conference on Population and Development (Cairo) and the 1995 International Conference on Women (Beijing) brought to light a much more visible and active role that NGOs would play in shaping international policy and human rights.

In 2000, the UN launched a global research strategy, called the "Millennium Development Goals" (MDGs), which attracted the support of many religious organizations throughout the world. The nations of the world had committed to eradicating poverty by 2015 and to achieving eight goals centered on the eradication of poverty, achievement of universal primary education, promotion of gender equality, maternal health, reduction of child mortality, combating major diseases, environmental sustainability, and international development cooperation. Religions for Peace (formerly, "World Conference of Religions for Peace"), a global interfaith NGO in consultative status with the UN, produced a report titled "Faith in Action: Working Towards the Millennium Development Goals" to provide religious organizations and leaders with the tools to carry out

advocacy campaigns to support the achievement of the MDGs (Religions for Peace 2007). Many UN-affiliated international religious organizations as well as countless national and local religious organizations supported efforts to achieve the goals, in particular goals related to education and health. In 2015, the UN launched "Agenda 2030" – an international development agenda to succeed the MDGs and one more ambitious and universal in its scope. The UN and the World Bank have made explicit the key role that religious organizations play and will need to play in order to meet the goals of equity, prosperity, sustainability, and peace by 2030. To review lessons learned from the FBO-UN partnership, the UN has since created an Inter-Agency Task Force on Engaging with Faith Based organizations for Sustainable Development to exchange and build knowledge about outreach and collaboration with religious entities.

## Religious, Organizational, and Strategic Dimensions of Religious Organizations

Figure 1 provides a table outlining the religious, organizational, and strategic dimensions of religious organizations. Rather than looking at religious organizations as monolithic entities, this framework permits a closer look at the various dimensions of an organization's operation. While it can be adapted to most religious organizations, it is most relevant for charitable, development, and sociopolitical organizations.

Religious, organizational, and strategic dimensions of religious organizations

| ***Religious dimensions*** | | ***Organizational dimensions*** | ***Strategic dimensions*** |
|---|---|---|---|
| *Self-identity* | *Mission* | *Structure* | *Approach/ methods* |
| Baha'i | Framing | Unitary Corporate | Advocacy/ lobbying |
| Buddhist | Focus | Federated | Awareness raising |
| Christian | Humanitarian relief | Confederated | Capacity building |
| Hindu | Legal reform | Autonomous | Coalition building |
| Muslim | Social service | | Coercion/ violence |
| Spiritual | Propagation of religion | *Representation* | Dialogue |

**Religious Organizations, Fig. 1** Religious, organizational, and strategic dimensions of religious organizations (Adapted from Berger 2003)

## Religious Dimensions

Prior to the recognition of "religious organizations" as a distinct field of organizations, in the early 2000s, organizations were predominantly classified according to their mission or strategic focus. Categories included: environmental, human rights, women's rights, development, and humanitarian relief organizations, among others. While this is one way to map a complex universe of organizations, it doesn't capture the distinct qualities of organizations, whose identity and mission are shaped by religious or spiritual convictions. The framework examines this dimension by looking at four variables: self-identity, pervasiveness (of religious influence), relationship to religious leadership, and mission.

The **religious self-identity** of an organization confers a number of distinct advantages to the organization, which can be thought of "religious" resources that assist the organization to carry out its mission. These include the spiritual and moral values that guide the work of the organization, such as the Jewish principle of *tikkun olam*, the Muslim principles of *zakat* and *waqf*, the principles of "engaged Buddhism," the Bahá'í principle of building capacity to contribute to the betterment of the world, the Christian principles of charity, etc.). The long history of religious communities throughout the world also translates into greater demographic and geographic of religious organizations as compared to their secular counterparts. Where religious communities are fully integrated into the life of a particular population, or have provided essential social, spiritual, and cultural resources for a long period of time, relationships of trust have formed. These are seen as among the most valuable assets that religious organizations bring to the table as potential partners in international development efforts – religious organizations provide "access" to populations through their long-standing physical and cultural presence in communities and their ability to appeal to the depths of human motivation. When addressing cultural practices such as child marriage, female genital cutting, or the education of girls, development agencies have found that they must work first at the level of community beliefs and attitudes in order for projects to be meaningful and sustained.

Other "religious" resources include the ability to mobilize adherents on the basis of moral imperatives, access to national and international organizational networks of religious institutions and believers, access to financial resources of the respective religious institution and its adherents, as well as tax-exempt status. Religious organizations and communities, by virtue of their traditions of tithing and sharing of one's wealth, are able to generate financial resources that often rival, and exceed, those of international development organizations.

A further religious dimension is an organization's **relationship with the authoritative religious institution/body** of the respective religious tradition. We can distinguish between four different types of relationships: subordinate, cooperative, independent, or oppositional. Roman Catholic religious orders, for example, are arranged in congregations, but are not necessarily under the direct authority of the Catholic Church. As such, we might think of them in terms of having a "cooperative" or "independent" relationship with religious authority. The US Conference of Catholic Bishops falls under the authority of the Vatican and as such can be considered as having a "subordinate" relationship to its religious leadership. The Muslim advocacy organization, Musawah, whose work challenges many authoritative interpretations of Islamic scripture, would fall under the category of "independent" or "oppositional." Many Jewish, Hindu, and Buddhist organizations – associated with decentralized traditions – could be categorized as "independent."

While religious and secular organizations often work toward the same ends, e.g., humanitarian relief, social justice, etc., their **motivation** is articulated in different terms. Religious and faith-based organizations are animated by a worldview, which is rooted in a belief in the transcendent. For some, this worldview is rooted in a belief in "God"; for nontheistic organizations (such as Buddhist or Hindu organizations), this may be described as "dharma" or in reference to "Brahman." A worldview oriented toward the

transcendent gives rise to a particular way of seeing the world, of understanding one's role in the world (in particular in the face of oppression and injustice), and of carrying out that role in the world. Such a worldview often imposes a sense of personal "duty" and responsibility on adherents vis-à-vis their fellow man. It is this sense of duty that is expressed in the work and mission of many religious organizations. The language of the sacred writings of various religious and spiritual traditions has for thousands of years been interpreted and used by believers as a source of motivation, as a call to sacrifice one's comfort and wealth for a higher cause, a call to work for justice, and to endeavor to realize the vision conveyed in the scriptures. (It is important to acknowledge that the philosophical/ideological roots of much of transnational social movement activism are, in fact, religious. They are rooted in early missionary work, and motivated by the religious convictions of the founders of respective movements.)

The **pervasiveness** of the religious dimension refers to the extent to which religious affiliation defines the organization's identity, decision-making, membership, and resource base. This category sheds light on the idea that there are no purely "secular" or "religious" organizations and that religious identity and religious resources are articulated and deployed differently depending on the organization.

The fourth religious dimension is the organization's **mission**. It concerns not only the tangible outputs of the organization but also the meaning attached to that "output" by the members of the organization. The mission might encompass: humanitarian (or emergency) relief, social services (e.g., health care, education), mobilization of opinion, education/awareness raising, or missionary work, among others. Yet looking only at the observable behavior or "output" of a religious organization, one is likely to miss the religious dimension (with the exception of missionary work). What renders the work "religious" (or spiritual) is the particular worldview, which inspires, informs, and shapes the work as a whole. While some religious organizations focus on the propagation of their religious beliefs, most give expression to these beliefs through the tangible work performed in the name of a social good.

Below are excerpts from mission and vision statements from major development and social justice organizations, as conveyed on their respective websites. (See Fig. 2.)

Yet another dimension concerns **beneficiaries**, as differentiated between members (or adherents of the religious organization) and external target groups.

It is important to note that the variables in the "religious dimensions" category of the framework may not be discernible in the visible actions of the organization. The relief and humanitarian work done by religious and secular organizations often looks the same. In fact, in recent years, it has been acknowledged that the divide between religious and secular organizations is becoming increasingly blurred. What remains significant however is that without an understanding of this internal dimension of religious organizations, it is not possible to fully understand the rationale and significance of their engagement in society.

## Organizational Dimensions

The organizational dimensions of religious organizations – structure, representation, resources, and geographic range – in many ways, resemble those of their secular counterparts. Structure refers to the degree of centralization of authority among RNGO offices; representation refers to the constituents on whose behalf the organization claims to speak; resources refer to the source of financing; and geographic range assesses the physical spread of the organization's affiliates (as measured by an official presence in a given locality). Together, these dimensions begin to reveal the complexity and diversity of the ways in which religious entities organize themselves for action.

**Representation** is a particularly salient issue for advocacy-focused organizations as a large membership base coupled with the support of an authoritative religious institution confers much needed legitimacy and moral authority to the mission and work of the organization. Given that religious and spiritual teachings lend themselves to different interpretations – often leading to

Excerpts from mission statements of selected religious organizations

*Bahá'í International Community*
"All human beings "have been created to carry forward an ever-advancing civilization," according to the sacred scriptures of the Baha'i Faith. The notion that every nation, community, and person has a part to play in building a peaceful and prosperous global society is central to the work of the Baha'i International Community's offices."

*Brahma Kumaris*
"A worldwide family of individuals from all walks of life, we are committed to spiritual growth and personal transformation, believing them essential in creating a peaceful and just world. Acknowledging the challenges of rapid global change, we nurture the well-being of the entire human family by promoting spiritual understanding, leadership with integrity and elevated actions towards a better world."

*Islamic Relief Services*
"Islamic Relief USA provides relief and development in a dignified manner regardless of gender, race, or religion, and works to empower individuals in their communities and give them a voice in the world. We remain guided by the timeless values and teachings provided by the revelations contained within the Qur'an and prophetic example."

*Religions for Peace*
Through *Religions for Peace*, diverse religious communities discern "deeply held and widely shared" moral concerns, such as transforming violent conflict, promoting just and harmonious societies, advancing human development and protecting the earth. *Religions for Peace* translates these shared moral concerns into concrete multi-religious action.

*Religious Action Center of Reform Judaism*
"Inspired by the words of the prophets in our sacred texts and profound commitment to *tikkun olam*, the Religious Action Center aims to bring a uniquely Jewish progressive voice to the national conversations shaping social justice and public policy in America."

*Soka Gakkai International*
"We, the constituent organizations and members of the Soka Gakkai International embrace the fundamental aim and mission of contributing to peace, culture and education based on the philosophy and ideals of the Buddhism of Nichiren Daishonin."

*World YWCA*
"The World YWCA is based on faith in God the Almighty, Jesus Christ and the Holy Spirit. Its vision is of a fully inclusive world where justice, peace, health, human dignity, freedom and care for the environment are promoted and sustained by women's leadership. Towards this end, the World YWCA advocates and supports volunteerism, membership, diversity, tolerance, mutual respect, integrity and responsible accountability."

**Religious Organizations, Fig. 2** Excerpts from mission statements of selected religious organizations

major divisions within religious communities – a claim to represent an entire religious community or a denomination can be controversial. A challenge facing religious communities is ideological divides, which can result in clashes between "liberal" and "conservative" believers. This comes into stark relief in the area of women's sexual health and reproductive rights: organizations affiliated with the same religious tradition may take very divergent views on this topic (e.g., Catholic for Free Choice and Center for Family and Human Life). Religious organizations define their membership according to a broad spectrum of parameters. The Lutheran World Federation, for example, states that it is "a global communion of 145 churches. . .representing over 72 million Christians"; "the Union for Reform Judaism represents 2.2 million Jews across 873 congregations." Other religious organizations frame this issue differently. Muslims for Progressive Values

describes itself as striving to "embody and be and effective voice of the traditional Qur'anic ideals of human dignity, egalitarianism, compassion and social justice."

The question of **resources** plays a major role in determining the character and agenda of an organization. Many religious organizations are privately funded, with a substantial portion of financial resources coming from members in the form of donations, dues, or tithes. Some religious organizations, such as the Baha'i International Community, accept funds only from members of the respective religious community. At the other end of the spectrum, Catholic Charities – the largest network of independent social service organizations in the USA – receives as much as two thirds of its funding from the federal government. The policy of Western donors toward religious organizations has generally been restricted by constitutional conventions on the separation of church and state. Yet the rapidly changing place of religion at all levels of society, including in the domain of international relations, has strained conventional approaches and forced donors to rethink the criteria for effective allocation of resources. Today, religious organizations channel significant financial resources from Western donors to countries in the "developing" world. In addition to securing donor resources, they are able to mobilize large volumes of resources from among their adherents.

Most advocacy-focused religious organizations that seek to influence government policy are particularly cautious to accept government funds. In many cases, reliance on public funding can affect an organization's posture toward government policy (which they may be challenging) and may have negative repercussions for its reputation and efficacy.

The **geographic range** of an organization examines the physical presence of the organization, as determined by an official presence in a given locality. Some religious organizations have a presence in over 100 countries (e.g., World Vision, Bahá'í International Community, others); others are active on a more local or national level. There is a tremendous diversity of **organizational structures** across religious organizations including diocese, congress, union, league, association, etc. To organize these diverse configurations, the framework distinguishes between structures based on the degree of centralization/decentralization of decision-making power. It provides a four-part typology including: unitary corporate (e.g., Habitat for Humanity), federation (e.g., Lutheran World Federation), and confederation (e.g., World Jewish Congress). Many Jewish organizations and those representing Catholic religious orders can be characterized by a loose central coordinating structure. Aside from religious differences, the choice of organizational structure may be justified in purely practical terms. Centralized structures, which tend to be the most efficient in terms of decision-making and resource-allocation, may be better suited to advocacy and relief-oriented missions while more flexible autonomous structures are adopted by RNGOs with a predominantly social service or spiritual guidance dimension.

## Strategic Dimensions

Religious organizations use a variety of **approaches** to achieve their aims. Many of these are common across and religious and secular (predominantly social justice) organizations: advocacy/lobbying, awareness raising, capacity building, coalition building, dialogue, knowledge building, monitoring (following issues of interest, such as government actions, in an informed manner), modeling, moral suasion, and protest. While prayer may be part of a strategy used by religious organizations, individuals working in secular organizations may also do it privately. The highly networked structure of religious communities lends strength to many strategies of religious organizations as efforts can efficiently be scaled up using the existing physical, social, and communications infrastructure.

A discussion of approaches taken by religious organizations would not be complete without reference to violent and coercive means employed by radical and extremist organizations. Research about terrorism and violence committed in the name of religion quickly proliferated since the attacks on the World Trade Center towers on September 11, 2001. In the past decade, media

attention has focused on extremist organizations citing religious scriptures to justify barbaric and hateful crimes. Examples include Boko Haram, ISIS or ISIL, Al Qaeda, Hezbollah, and Aum Shinrikyo (split in 2007), among many others. The ongoing challenge in containing religiously motivated violence is that those committing the violence believe it to be sanctioned by divine mandate. Such a belief has shown to have tremendous potency, especially when coupled with a sense of pride (individually and collectively), a supporting religious community, and a culture of violence.

## Emerging Issues and Challenges

The landscape of religious organizations continues to evolve as religious voices seek to assert themselves in the modern world. While typically associated with service provision and humanitarian relief, religious organizations have entered political arenas and policy debates to challenge dominant paradigms of development and progress and to question the integrity of the prevailing social and economic order. In addition, the tremendous movement of populations, domestic and international, voluntary and forced, is rapidly changing the demographics of communities and bringing diverse belief systems into greater contact with each other – further impacting the landscape of religious organizations. In the current social and political climate, a number of issues and challenges are of particular significance to religious organizations. These include: the rise of fundamentalist and extremist groups and movements, gender equality, misperceptions and misunderstandings between religious and secular groups, and religious freedom.

In the past decade, the landscape of religious organizations has been increasingly complicated by the rise of **religious extremism and fundamentalism**. New movements and groups have exploited political fragilities and have instrumentalized religion to promote extremism, exclusion, and violence. These new and emerging actors make use of religious and social discourses to foment social divisions, thereby undermining peace and security both domestically and globally. Many religious organizations have become engaged in activities countering violence extremism by promoting intercultural and interfaith understanding and denouncing extremist, hateful, and misogynist interpretations of religious doctrine. The participation of religious organizations in these efforts is particularly important in conflict areas and fragile states in order to integrate the voice of the faith community in dialogue and peace processes.

Religious organizations are also facing rising criticism for their failure to engage with the structural and systemic barriers to **gender equality**. Despite their long history of service delivery and humanitarian relief, religious organizations have operated largely within existing cultural frameworks, without acknowledging the deep influence of patriarchal norms associated with many religious communities, institutions, and practices. Religious teachings continued to be interpreted (largely by men) and used to justify discrimination and violence against women and girls. The absence of women in positions of authority in religious traditions often excludes their voices from the interpretation of religious teachings. Today, issues of gender equality, sexual and reproductive health, and rights are among the most contentious in the entire development agenda – leading to deep ideological divisions between secular and religious organizations. The resulting perception of a fundamental incompatibility between religion and human rights has often discouraged engagement with religious organizations. Yet, today, a growing number of feminist religious organizations are leading the way in reexamining religious laws and advocating for women's rightful participation in the interpretation of religious doctrine (e.g., Sisters in Islam, Musawah).

The lack of **religious literacy** among the general population, and within the development community, poses a challenge to effective collaboration with religious organizations. There is a tendency to treat religious organizations as monolithic, failing to note the internal diversity of religious views and perspectives, and the influences of culture, politics, and individual

personalities on religious organizations. While this diversity significantly complicates the map of religious organizations, it is also serves as a reminder that very few religious organizations represent the views of an entire body of believers, and that generalizations across entire religious traditions are often impossible and misleading. A further element of religious literacy is the understanding of the role that religion plays in people's lives. For many years, development and progress had been conceived in material and technical terms – as captured, shorthand, by a nation's GDP, for example. It took many years to understand the key social roles that religious organizations played in the lives of the majority of the world's people – they were among the most trusted social institutions, particularly where government infrastructure was weak and where the majority of social services were provided by religious organizations.

Perceptions of religion and religious organizations in secular society remain clouded in **suspicion**. Religious organizations are often perceived to be divisive, exclusionary, and political – competing for followers and contributing to existing social tensions. They are seen as being supportive of traditional patriarchal structures that conflict with universal human rights. The suspicion goes both ways: religious organizations may fear that international organizations and donor agencies may try to use them to further already defined policies. Having been long excluded from policy and decision-making concerning development, the rapid rise in interest in partnering with religious organizations is interpreted by some as opportunistic and potentially exploitative. As such, much work needs to be done to foster more informed and transparent collaboration.

Further suspicion is driven by concerns about **proselytization** agendas and activities of religious organizations. Many religious organizations have addressed this concern by becoming signatories to "The Code of Conduct for the International Red Cross and Red Crescent Movement and NGOs in Disaster Relief." As of March 2016, over 600 organizations (religious and secular) have signed the Code of Conduct, which states that, "Aid will not be used to further a particular political or religious standpoint," and that "We will not tie the promise, delivery or distribution of assistance to the embracing or acceptance of a particular political or religious creed."

In addition, given the norm of **"church-state" separation** throughout the Western world, there is hesitation to engage with religious organizations in a way that may be perceived as violating this norm. Yet, at the same time, it is important to understand the cultural and historical specificity of this type of "church-state" relationship; it is not an idea native to other parts of the world, Asia in particular. In each country, the nature and function of the religious organization is shaped by the country's constitutional relationship between the religion and the state. This relationship ranges from clear separation, where religious organizations and institutions are private (e.g., the USA, France), to full integration, where religious institutions are "established" by the government (e.g., Iran, Pakistan). The religion-state relationship shapes the legal and cultural norms, which either give rise to support or inhibit the formation of religious organizations. In countries such as India, the relationship is characterized by pluralist accommodation where the government supports the operation of a variety of religious organizations – both charitable and politically oriented entities.

From the perspective of international law, the baseline for countries is to uphold the universal **right to freedom of religion or belief**, which provides for the freedom to hold, and change religious beliefs, and to express those beliefs individually and collectively. This is a significant issue for religious organizations given that approximately 70% of the world's population lives under the rule of governments that place restrictions on this right.

## Conclusion

The role of religion in modern society continues to evolve. For much of modern history, scholars

assumed that as countries modernized, the influence of religious institutions and values would decline and cease to be relevant in the public sphere. Yet the secularization thesis, as it was known, largely ignored historical trajectories outside of the European experience and did not foresee the resurgence of religious voices and influential religious leaders, organizations, and movements. The geopolitical, social, and economic environment of the past 50 years has given rise to a religious agency, which among other things has found expression in a host of different kinds of religious organizations, seeking to give new expression to the vision and beliefs of their respective faiths.

The universe of religious organizations is highly diverse and complex encompassing small community-based unregistered religious groups working on specific issues such as maternal health or community farming, as well as transnational billion-dollar organizations with professionalized staff and offices in over 100 countries. Seen from one perspective these organizations appear very much like their secular counterparts, with concerns about executing on a mission, carrying out work in the name of the common good, securing resources, and the like. Yet there are important differences that come with a religious identity and religious affiliation. Religious organizations, by virtue of their identity, can tap into vast networks of spiritual, social, financial resources, and motivational resources.

The of religious organizations role in society is not uncomplicated. There is much anxiety and concern among secular organizations and institutions that the presence of religious organizations serves to foment conflicts and ideological divides. The rise of extremist and fundamentalist organizations has exposed the dangerous mix of vested political interests and ideology veiled in religious terms. Other challenges include religious organizations' stance on gender equality and their lack of engagement with structural and systemic aspects of gender inequality. At the same time, greater religious literacy is needed to distinguish and better understand the nature of different religious organizations. Since much of what we know about religious organization comes from our understanding of Christian entities operating in Europe and North America, religious literacy will also need to expand to encompass religious and spiritual organizations rooted in different cultural, political, and religious contexts.

# Reponses to Organizational Conflict

Duane E. Mitchell
Management and Education, University of Pittsburgh, Bradford, PA, USA

## Synonyms

Accommodation in response to organizational conflict; Avoidance in response to organizational conflict; Collaboration in response to organizational conflict; Competition in response to organizational conflict; Compromise in response to organizational conflict

## Definition

These are the responses to organizational conflict, in the field of organizational behavior: avoidance, competition, accommodation, compromise, and collaboration between the representatives of some combination of individuals and/or groups in response to interpersonal conflict, intergroup conflict, or conflict between an organization and one or more of its stakeholders.

## Introduction

A conflict involves some combination of individuals and/or groups who are experiencing interpersonal conflict, intergroup conflict, or conflict between an organization and one or more of its stakeholders. Additionally, an individual involved in a conflict may represent themselves, or the individual may be represented by one or more people who are acting on behalf of the individual. When groups of individuals are involved in a conflict, such as (a) a team, (b) work group, (c) department, (d) division, or (e) an entire organization, the group is typically represented by one or more people during a conflict. Typically, it is not the entire group who is active in organizational conflict. It is really the person or people who represent the particular individual, or group who are in conflict with another party's representative or representatives (Griffin and Moorhead 2007). Therefore, the parties involved in organizational conflict, whether they are individuals or groups, will be referred to as *representatives* for the remainder of this essay.

The representatives involved in a conflict will respond along two dimensions (Griffin and Moorhead 2007). These two dimensions are (a) the *level of aggressiveness* and (b) the *level of goal compatibility* (Fig. 1). Along the first dimension, the representatives' level of aggressiveness will determine what level of *fight* or *flight* (Gray 1987) will occur in a particular conflict situation (McShane and Von Glinow 2015). Representatives may respond to a challenge present in a conflict by fighting back or pressing against the challenge with a varying degree of force. A high level of force will result in either competition or collaboration depending on the level of goal compatibility. Representatives may also respond with flight by running away from the challenge present in a conflict in order to avoid it. Similarly, they may *freeze*, that is, ignore or not respond at all to a challenge present in a conflict. A low level of aggressiveness will result in either avoidance or accommodation depending upon the level of goal compatibility. Only a medium level of aggressiveness combined with a medium level of goal compatibility will result in compromise; see Fig. 1.

Along the second dimension, the level of goal compatibility will impact the representatives' willingness or lack of willingness to work with the other party in a particular conflict situation (Griffin and Moorhead 2007). Goal compatibility is a measure of the extent to which the representatives' goals are interdependent, thus requiring each side to work toward satisfying their own and the other sides' goals simultaneously (Thomas and Kilmann 2008). Varying levels of aggressiveness along the first dimension combined with varying levels of goal compatibility along the second dimension as expressed by representatives will determine the response to conflict. Within the two dimensions, representatives may express one of five responses to conflict; these are avoidance, competition, accommodation, compromise, and

**Reponses to Organizational Conflict, Fig. 1** Five possible responses to conflict by representatives in a conflict. (Adapted from Thomas et al. 2008. Copyright 2008 by Emerald Group Publishing Limited. Reprinted by permission)

collaboration (Fig. 1). Each of these responses will be discussed in the following sections, respectively.

## Response One: Avoidance

"The most natural manner in which all animals, including man, eliminate conflict is to avoid it" (Robbins 1974). Avoiding may involve "smoothing over" or "evading" a conflict entirely (McShane and Von Glinow 2015, p. 321). An avoidance response will occur if the representatives involved in a particular conflict have a low level of goal compatibility and a low level of aggressiveness (Fig. 1). In this situation, for example, an individual from one department may ignore a request from another individual or department. The requesting individual or department could decide not to follow-up on the request resulting in mutual avoidance by all representatives in the conflict (Griffin and Moorhead 2007). The representatives may carry out an avoidance response by diplomatically sidestepping an issue, procrastinating, or withdrawing from the particular conflict altogether (Thomas and Kilmann 2008).

## Response Two: Competition

Competition is when the representatives involved in a conflict try to win at each other's expense through means of legitimate and coercive power in an attempt to force each other's compliance or submission (McShane and Von Glinow 2015, p. 298, 320). If the representatives involved in a particular conflict have a low level of goal compatibility and a high level of aggressiveness, then the response will be one of competition (Fig. 1). It is the opposite of accommodation (Thomas and Kilmann 2008). If all of the representatives are striving to accomplish the same goal, but only one representative will be able to achieve the goal, then competition ensues because the representatives are in competition with each other to reach the same goal (Griffin and Moorhead 2007). In the process of competing, the representatives may stand up for their rights, defend a position believed to be right, or focus on trying to win (Thomas and Kilmann 2008).

Sometimes, competition can turn into conflict. In regard to organizations, such as auto manufacturers, competing against each other, Robbins (1974) explained that when the market is expanding, competition will occur, but when the

market becomes stagnant or shrinks, then in order for one organization to win, another must loose, and conflict ensues. Competition can turn into conflict if, during a competition, emotions become too escalated, or there is a lack of/or ambiguous rules, then affective conflict (or relationship conflict) will occur (Amason and Sapienza 1997; Cosier and Rose 1977; Jehn and Bendersky 2003).

Kohn (1986) described a situation where freight warehouse workers were competing to win public recognition in a company newspaper. Recognition would go to the first, second, or third shift team with the highest productivity level during any given week. The competition resulted in increased company output each week benefiting both the teams and the company. However, after about 3 months, emotions became escalated and affective conflict ensued resulting in sabotage and cheating which lowered company output each week and harmed both the teams and the company. In this situation, if the representatives involved in the affective conflict agree to separate for a period of time until tempers cool, and/or they agree to the use of clear rules, then the conflict can become constructive (sometimes called constructive conflict) and revert back to a healthy competition (Griffin and Moorhead 2007; Jehn and Bendersky 2003).

## Response Three: Accommodation

Accommodation involves one side yielding to the wants of the other side without consideration of its own wants or needs (McShane and Von Glinow 2015, p. 321). If the representatives involved in a particular conflict have a high level of goal compatibility and a low level of aggressiveness, then the response will be accommodation (Fig. 1). It is the opposite of competition (Thomas and Kilmann 2008). In the process of accommodation, the representatives may act selflessly, generously concede to another's demands or requirements, or simply yield (Thomas and Kilmann 2008). In this situation, for example, two departments at an accounting firm may have scheduled a department meeting in the same conference room during the same time slot. The representatives of the two departments may not be very concerned about the particular time a meeting is held as long as both meetings are able to take place. The representatives would accommodate each other by finding two time slots that work, one for each of the departments.

## Response Four: Compromise

Compromise is when the representatives find a position in which losses are offset by equivalent gains (McShane and Von Glinow 2015, p. 321). If the representatives involved in a particular conflict have a medium level of goal compatibility and a medium level of aggressiveness, then the response will be compromise (Fig. 1). Compromise is midway between competition and accommodation and shares some characteristics with both (Thomas and Kilmann 2008). In the process of compromise, the representatives may seek mutual satisfaction, or split the difference, mutually concede something, or find an expedient middle ground (Thomas and Kilmann 2008).

Union negotiations with management provide a typical example of compromise (Griffin and Moorhead 2007). Management and union leaders will come to the table with certain demands and compromises in mind. Rounds of offers and counteroffers may be made. In the end, negotiations end with compromise between the two parties.

## Response Five: Collaboration

Collaboration involves problem solving by both sides, which is also beneficial to both sides, resulting in a win-win scenario for the representatives involved in a conflict (McShane and Von Glinow 2015, p. 320). If the representatives involved in a particular conflict have a high level of goal compatibility and a high level of aggressiveness, then the response will be collaboration (Fig. 1). In the process of collaboration, the representatives may explore the disagreement together, learn from each other to prevent resource competition, and/or confront interpersonal problems to find inventive solutions that will lead to mutual satisfaction (Thomas and Kilmann 2008).

Two university departments trying to determine spring and fall course schedules are good examples (Griffin and Moorhead 2007). If the accounting and finance department both want specific classes to be offered in the spring, they can determine the proper sequence of classes to meet student needs through collaboration. This process may seem simple, but it can be difficult to work through. The overarching needs of students provide the goal compatibility to allow department representatives to aggressively find solutions. "Collaborative relationships can lead to new and innovative ideas and solutions among parties" (Griffin and Moorhead 2007, p. 403).

## Conclusion

Organizational conflict involves two or more parties. Groups do not typically participate in a conflict as a group of individuals. Instead, one or more individuals will typically act as representatives on behalf of the group. Individuals may choose to represent themselves, or they may have one or more people acting as representatives on their behalf. Therefore, it is the representatives who are responding to the organizational conflict.

The representatives in a conflict will respond along two dimensions: (a) the level of aggressiveness and (b) the level of goal compatibility. The level of aggressiveness will determine a fight, flight, or freeze response to some degree from the representatives. The level of goal compatibility will determine the extent to which the representatives' goals are interdependent and thus the degree of willingness, or the absence of willingness, of representatives to work with each other during a conflict. The representatives' varying levels of aggressiveness in combination with their varying levels of goal compatibility will, together, determine the representatives' response to organizational conflict. Within these two dimensions, there are five possible responses to conflict; these are (a) avoidance, (b) competition, (c) accommodation, (d) compromise, or (e) collaboration. Managers must understand the nature of the representatives' responses to conflict within the two pertinent dimensions before they can begin to effectively manage organizational conflict.

# Representative Bureaucracy

Nancy S. Lind
Department of POL, Illinois State University, Normal, IL, USA

## Synonyms

Civil service bureaucracy; Racial representation

## Definition

Active Representation: The degree to which the social characteristics of the bureaucracy lead them to advocate for the interest of their social or demographic group.

Appropriated Representation: Hereditary right.

Bureaucracy: The civil service arm of the executive branch of government.

Descriptive Bureaucracy: The agency mirrors the dominant groups in society.

Passive Representation: The degree to which the social characteristics of the bureaucracy represent the social characteristics of the clients in the population.

Virtual Representation: Identity of interests.

## Introduction

In the field of public administration, considerable debate concerning the representation of minorities in the public bureaucracy attracts significant attention. The theory of representative bureaucracy developed at a time when there was concern about elected officials holding important policymaking positions in government agencies. Civil servants exercise considerable discretion in implementing the laws passed by elected officials.

Representative bureaucracy is fundamental to democratic principles such as legitimacy and acting on behalf of others (Mosher 1982). While a number of scholars argue for such representation, others believe that the bureaucracy cannot, and should not, be a representative institution. In the literature, there has long been concern with whether or not all social classes or minority groups are represented in government positions. The earliest reference to the concept of representative bureaucracy is found in Donald Kingsley's interpretation of the British civil service in 1944. Kingsley's concern was that the British civil service was composed only of economic, political, and social elites, and, as a result, the interests of other groups were ignored in the policymaking process. In short, representative bureaucracy was necessary to meet the interests of all social classes. Kingsley argued that the Labour party, if it came to power, would find the alleged neutrality of the British civil service system inaccurate. He contended that class lines would be clear and that the lower class would find no representative. He stated that representative bureaucracy would be necessary to protect the concerns of the dominant political party. Representative bureaucracy was designed for a less elite, less class-based civil service system.

Krislov's seminal work 30 years later challenged Kingsley's notion that representative bureaucracy could be viewed only in terms of social class. The issue in the United States was catalyzed by the race riots in the 1960s and claims for women's rights in the 1970s. Professor Sam Krislov's book entitled *Representative Bureaucracy* written in 1974 remains an enduring work in public administration literature. The book was part of the emerging debate regarding the desirability of affirmative action programs and scholarly arguments over whether agency bureaucrats should represent anything other than the interests of their agency or their own self-interest. In answering these issues, Krislov developed an empirically testable framework for representative bureaucracy.

For Krislov, "the representative bureaucracy is the idea that broad social groups should have spokesmen and officeholders in administrative as well as political positions" (1974, p. 4). Interestingly, when the book began to take form, the concept was considered inconsequential. Krislov, on the other hand, believed that bureaucratic representation was very near the heart of societal problems. His concern, then, was with the relationship of bureaucracy to the larger social system under the rubric of representative democracy.

Krislov stated that the representativeness of the American bureaucracy can be borne out by a review of those in positions of power in an agency. He states, "A broad range of talents, types, and social and ethnic backgrounds is to be found in the operative portions of government" (1974, p. 36). He contends that bureaucracy is more representative than the other branches of government. Further, representation is desirable as it brings multiple perspectives to the policymaking process.

In his discussion on representative bureaucracy, Mosher (1982) distinguished two main forms of representation. A distinction is made between passive and active representation. Passive representation concerns the background of the individual and the degree to which they mirror society. This is also referred to as "symbolic representation." Passive representation exists when bureaucrats' demographic characteristics are the same as the demographic characteristics of the population.

With active representation, the idea is that the individual is expected to lobby for the interests of those whom they represent. This action, also referred to as substantive representation, is when officials support a policy agenda based on their personal and political party's views. With active representation, there is an underlying belief that women, for example, will be more likely to support issues that benefit women. Mosher argued that passive representation may lead to active representation.

Complicating the situation described by Krislov, however, is the recognition that the majority of bureaucrats undergo the same socialization processes and hence tend to become part of the middle class and may no longer be able to represent the interests of the groups from which they were drawn. That is, the socialization process negates their individual experiences.

## Representation by Levels of Government in the United States

Norton Long recognized the importance of bureaucracy in its exertion of influence on how a society is governed. As stated by Long (1952, p. 813):

Given the seemingly inevitable growth in the power of the bureaucracy through administrative discretion and administrative law, it is of critical importance that the bureaucracy be both representative and democratic in composition and ethos. Its internal structuring may be as important for constitutional functioning as any theoretical or practicable legislative supremacy. That wonder of modern times, the standing army possessed of a near-monopoly of force yet tamely obedient to the civil power, is a prime example of the efficacy of a balance of social forces as a means to neutralization as a political force. A similar representation of the pluralism of our society in the vitals of the bureaucracy insures its constitutional behavior and political equilibrium.

In this study on American bureaucracy, Long found that the federal bureaucracy was broadly representative of the American populace in terms of demographic characteristics such as age, income, and education. In fact, he found that the bureaucracy was more representative of the public than were the political branches such as that of the presidency, legislature, or courts. It is important to note though that representation is not consistent throughout all layers because as one moves up the ranks of the civil service system, the less representation that is found. The greatest degree of representation is found only at the lowest General Schedule levels. Both the percentages of minorities and women decrease as one moves up the bureaucratic hierarchy. Thus, at the upper ranks of the decision-making level, there is very little representation.

The Civil Service Reform Act of 1978 requires that federal agencies take proactive steps to achieve a representative bureaucratic workforce. Remaining controversial is whether passive representation is sufficient or if active representation should be pursued to advocate on behalf of the traditionally underrepresented and underserved groups in the population.

Empirical studies have indeed demonstrated that representation does make a difference. Hindera (1993) in a *Journal of Public Administration Research and Theory* article found that when government services were delivered by a representative workforce to an underserved population, positive results were produced. Another important study by Thielemann and Stewart (1996) found that clients with AIDS were more willing to seek government health services when the provider shared the same demographic background.

An understanding of representation at the state level focused on whether the agency directors set the agenda for the agency and whether this group was representative of the larger populace.

Brudney et al. (2000) found that minorities and women have made progress toward expanding their representation at the higher levels of agencies, but few had reached the highest policymaking levels. Their question was whether this passive representation translated into more active representation. They developed a model of representative bureaucracy and tested it empirically with state agency directors across all fifty states. Their findings did suggest that on certain issues, race and gender had direct effects and influenced the decisions of administrators. Their research found an intervening variable of organizational roles between passive representation based on race/ethnicity and gender and active representation, the administrators' attitudes, and behaviors. Study results showed that nonwhite and women agency heads differed significantly in the values and organizational role sets they held for state administration. The critical element in their model of representative bureaucracy is the administrator's value which is hypothesized to mediate between passive and active representation. The model also tested for the possibility that active representation may occur directly through the influence of race and gender on administrator's behaviors. Their findings suggested that race and gender can affect bureaucratic behaviors through the mediating influence of organizational roles. Thus, the demographic characteristics of race and gender do relate to administrative behaviors.

At the local level, studies have been done to evaluate whether or not bureaucracies were representative of the social groups predominant in society. The issue at the local level is often whether the concept of bureaucratic neutrality collides with the calls for a representative bureaucracy. This is so as local governments are often the primary providers of government services directly delivered to the public. Studies done by Bradbury and Kellough (2008) found significant differences in the way black and white administrators view social issues and that race plays an important role in the viewing of different issues. Black administrators, they concluded, are more similar to their citizen counterparts than were white administrators. They further concluded that passive representation could lead to active representation with a diversification of the bureaucrats within the local agencies.

Meier and Bohte (2001) examined the role that employee discretion plays in linking passive and active forms of representation in a sample of 600 school districts in Texas. They argued that active representation is enhanced in organizations that grant greater discretionary authority to their employees, and they see this discretionary authority as the "missing link" in studies of representative bureaucracy. They began with the assertion that while most bureaucracies are not designed as active representatives, they can still perform representative functions. Their article extends the literature on representative bureaucracy by focusing on the element of discretion. For a representative bureaucracy to translate from passive to active representation, bureaucrats need to have policy discretion over an area directly linked to their values. Their dependent variable, used to measure the translation of passive to active representation, is the percentage of minority students who passed the Texas Assessment of Academic Standards exam. Representation was measured at the street level as the percentage of faculty who were either African American or Latino. Their findings concluded that when street-level bureaucrats were given discretion, that strengthened the relationship between passive and active representation.

## Representative Bureaucracy in Europe

Gravier (2013) focused on staffing policies in the European Commission to determine if their staffing policies had taken nationality into account using the framework of representative bureaucracy. Their study found that the commission's staffing policies did in fact use a flexible strategy of representation to satisfy the criteria of representative bureaucracy. However, since European civil servants are loyal to the European Union, they found only passive representation.

Meier and Hawes (2009) argued that representative bureaucracy, while not present in France, could be a solution to a series of protests led by

ethnic minorities in regard to access to jobs in the public bureaucracy. They found that several French ethnic protests could be eliminated with a conscious effort to create greater representation in the bureaucracy. In short, they found that representative bureaucracy positively affects the management of ethnic conflict.

Drawing on theories of representative bureaucracy, Andrews and Miller (2013) examined whether increased representation of women in police forces in England leads to a higher rate of domestic violence arrests. Their results found that this was true only when the increased representation of women was accompanied by a greater degree of discretionary authority when carrying out frontline police duties.

## Representative Bureaucracy in South Africa

Naff and DeLeon (2010) test the hypothesis that as a bureaucracy becomes more representative, it gains greater legitimacy from the citizens. This hypothesis tests whether the composition of unelected bureaucrats is of great political consequence in a democracy. This study was performed following the fall of apartheid in South Africa. The formal political transition of the 1990s required reconfiguring the all-white civil service bureaucracy to reflect the diverse citizenry. Their study sheds light on passive representation but not on the linkage between active and passive representation.

## Representative Bureaucracy in Malaysia

Kuan Heong (2015) examined the development and representativeness of the Malaysian civil service. There are three major ethnic groups in Malaysia: Malays, Chinese, and Indians. The civil service, however, had a largely mono-ethnic bureaucracy with over 75% Malay. Traditionally, males were overrepresented in the civil service at all levels. The trend with females began to reverse in the twenty-first century with an increasing proportion of females as applicants for bureaucratic jobs. Thus, their concern on representativeness focused more on ethnic origins. Underrepresentation of Chinese and Indians still exists with the official line being that they are not applying for government jobs. They may not be applying, however, as Malays still hold the bulk of top-level positions, and the minorities may view their path to promotion as blocked.

## Criticisms of Representative Bureaucracy

Despite many scholars advocating representative bureaucracy as a panacea for several societal ills, others find serious weaknesses in representative bureaucracy. Kim (1994) finds that representativeness does not necessarily lead to greater responsiveness as similar social backgrounds do not always lead to similar experiences. Second, he notes that there is no firm definition of representation, and this could lead to a slippery slope where every "economic class, religion, and geographic region" would need to be represented in exact proportion to its share in the population. He also maintains that representative bureaucracy could lead to bias in the policymaking process if active representation is followed.

Other scholars argue that governments may need to lower standards to achieve a more representative bureaucracy (Meier and Hawes 2009). Further, representation may lead to a trade-off between effectiveness and efficiency of the public service.

## Conclusion

Representative bureaucracy continues to be a controversial topic in the twenty-first century but is becoming the norm in modern democracies. In modern democracies, citizens expect to do business with bureaucrats who look like them as officials in government bureaucracies. Recent studies for both blacks and women have found that under certain conditions passive racial and ethnic representation can produce active representation, that is, policies that benefit minorities.

However, there is still incomplete information on what is the missing link between passive and active representation as scholars have run the gamut from addressing issues of diversity to discretionary authority to organizational role. While the debate rages on, many governments develop and implement policies to enhance the involvement of minorities and women in their bureaucratic agencies.

## Definition

| | |
|---|---|
| Passive representation | The level at which public servants statistically reflect the broader population in terms of personal, demographic characteristics. |
| Merit principle | A hiring principle for the public service whereby citizens have a reasonable opportunity to be considered for public sector employment, and that the selection process is based on the fitness of the individual to fulfill their role. |

## Introduction

A current, broad definition of representative bureaucracy is the belief that a bureaucracy that generally reflects the demographics of the public it serves will provide more benefits than a homogenous bureaucracy. However, how a bureaucracy can provide benefits to the public, what kind of benefits it can provide, what the term representation means, and which demographic characteristics should be reflected are all a matter of debate (Kim 1994). Thus, the theory of representative bureaucracy can be interpreted and applied in

multiple ways (Kim 1994; Kernaghan 1978). This has resulted in a sustained academic interest in representative bureaucracy, producing extensive and diverse theoretical and conceptual content that encourages regular examination and even reexamination based on the varying interests and interpretations of academics. It is therefore important to examine representative bureaucracy in various contexts, as it does not apply universally. In this regard, understanding representative bureaucracy in Canada is useful, as its federal bureaucracy has engaged in a unique technique of linking merit to representation in order to increase the representation of certain segments of the population. Moreover, in Canada, representative bureaucracy has played a central role in its political system, as it has been used as a tool for promoting national unity, by emphasizing representation of Anglophone and Francophones throughout the public service (Kernaghan 1978).

## Differing Interpretations of Representative Bureaucracy

Representative bureaucracy will not be discussed in extensive detail here, as it has been clearly defined already in this volume. For the purposes of understanding representative bureaucracy in Canada, it is important to note that this primarily concerns passive representation, rather than active representation. In other words, the focus of representation is on statistically mirroring a population, not a measurement of how actively public servants advocate for certain groups of the broader population.

It is also important to note that representative bureaucracy is not a universally accepted concept, and that it does have its criticisms. For instance, one key criticism that has generated a number of investigations using the theory of representative bureaucracy is related to the link between childhood socialization and bureaucratic action. A key component of representative bureaucracy is that a bureaucrat's personal characteristics influence their values and opinions, which then will impact their actions within the public service. Critics of this idea point out, however, that socialization does not stop after childhood or upon entering the workforce, rather it continues throughout one's entire life (Wilkins and Williams 2008; Meier 1993). More specifically, socialization continues with employment, particularly in the public service, where organizations seek to instill a common set of values, behaviors, and expectations in employees in order to ensure that all, or most, administrative decisions are consistent with the aims of the organization (Wilkins and Williams 2008).

Another criticism of representative bureaucracy is that the requirements of where exactly a bureaucracy should be representative have been highly contested. A core criticism of a general claim for a wholly representative public service is that most bureaucrats have little to no impact on policy or decisions, and therefore ensuring demographic representation has no value outside of symbolic representation.

Despite these criticisms, many academics and practitioners place importance on representative bureaucracy, including the Canadian government. For instance, according to the Treasury Board Secretariat (2017), the federal government "must have a diverse public service that is representative of the population it serves, so that all Canadians can see themselves in government." This is a clear emphasis and commitment to passive representation in all levels of the bureaucracy. Moreover, the Government of Canada, in defining the current role of the Public Service Commission of Canada, states that it "is responsible for promoting and safeguarding a merit-based, representative and non-partisan public service that serves all Canadians, in collaboration with its stakeholders." These sentiments are echoed in legislation as well, as both merit and representativeness are enshrined in the Public Service Modernization Act. Thus, the Canadian federal government currently demonstrates a clear commitment to merit and representation.

Such an explicit commitment to merit and representation has not always been the case in Canada, however. In fact, both merit and representation took a long time to feature as core principles in the Canadian public service. Understanding this history is important to understand how they came to be linked.

## Canadian Background

Before delving into the specifics of representative bureaucracy in Canada and how it has been linked to issues like merit and nation building, it is important to understand some key characteristics of Canada's history and political system. These characteristics provide the reasoning for how and why representative bureaucracy has evolved the way it has in Canada. First, Canada is a federal system, meaning that power is divided between a central government and regional governments, and such powers are delineated and protected in the Constitution. This entry is a discussion of representative bureaucracy in the federal (central) public service in Canada. Each province and territory is responsible for its own public service, and thus at the regional level of governments, these policies vary significantly.

This federal system was created primarily as a compromise – not all of Canada's constitutional framers wanted a federal system. First, the sheer geographical size of Canada was a factor, making it extremely difficult for one government to effectively govern and address the needs of such a large territory. Secondly, and most important for this discussion, there were competing views based primarily on the backgrounds of various groups. Many Anglophone founders desired a unitary system like that in Britain, whereas many Francophone and Maritime founders opposed this, for fear that their strong local identities and regional interests would be weakened in a unitary system. These competing visions for Canada are important, because although a federal system was eventually agreed to by all parties, there remained competing views as to what the structure and composition of this federal system entails.

The first vision, predominantly held by Anglophones, is one of the creation of a new union, or contract, between equal provinces and a federal government. The second vision, held primarily by Francophones, is one of two existing nations partnering together in a compact, with Quebec receiving a veto power over issues pertaining to their place within the federal structure. These distinct competing views on the federal structure remain to this day, and the role of Quebec in Canada continues to be debated.

Regardless of the view one espouses, both English and French were viewed as legitimate languages at Confederation. However, equal treatment of English and French by the federal government did not occur post Confederation, which led to a government and public service that was heavily dominated by the English language. This issue of the equality of English and French languages, and the federal government's responsibility in protecting this equality are essential to understanding representative bureaucracy in Canada. As will be explained in detail below, the drive for equality of languages heavily structured the implementation of representation, eventually leading to a unique merit-based approach.

## Merit and Representation

Merit was not the focus of hiring in the Canadian public service for a number of decades. Throughout the 1800s and into the early 1900s, public service appointments were based on patronage; the party in power hired and appointed party supporters. This led to a growing culture of resentment and a belief that the Canadian bureaucracy was lacking professionalism, competence, and expertise, and was too focused on bending to political influence. The first real mention of merit occurred in the Civil Service Act of 1882, which recommended that public service positions be open to competition, exams, and promotion by merit. This, however, remained largely ineffective and patronage continued to triumph, as noted by the nearly 80% turnover rate of public servants in the wake of a change in government (Kernaghan 2008; Rasmussen and Juillet 2009). Moral outrage at the political corruption of the public service continued to grow, especially as Canadians became more comfortable with the increased role and presence of government in society (Rasmussen and Juillet 2009). This led to the 1908 Civil Service Amendment Act, which stated that the public service should be a neutral instrument, impartially serving the interests of the state.

The changes in 1908 marked the first time merit actually triumphed in the Canadian public service, and focus finally shifted away from seeing and treating public servants like "handmaiden [s] of a political party" (Rasmussen and Juillet 2009: 90). That said, for a few decades more, elements of patronage continued to persist in the public service, and the notion that merit was the best solution to making the public service more responsible and effective began to be questioned. Originally, merit was lauded as the solution to end patronage, but shortly after being implemented, the principle of merit was defined and redefined in multiple ways satisfy various political concerns (Kernaghan 2008; Rasmussen and Juillet 2009).

For instance, two distinct types of merit exist: the merit principle and the merit system. The merit principle was never actually defined by the Canadian public sector until 2003, rather it was only referred to in legislation as the reasoning behind the merit system. This lack of definition is likely a core reason why the concept of merit was so often coopted by political parties to achieve certain ends (Kernaghan 2008; Rasmussen and Juillet 2009).

That said, the merit principle has generally been defined as two interrelated principles: that Canadians have a reasonable opportunity to be considered for public sector employment, and that the selection process is based on the fitness of the individual to fulfill their role (Dowdell 1971). The merit system, on the other hand, is the mechanism through which these principles can be achieved, and has been referred to as an administrative device that needs to adapt to changing circumstances (Dowdell 1971).

In 1962, the concept of merit was highlighted as a vital area of improvement in a large investigation into the possibility of public sector renewal in Canada. The Royal Commission on Government Organization, also known as the Glassco Commission, was created in 1960 in order to study the various organizations in the federal public sector in order to highlight inefficiencies, and make recommendations in order to improve overall efficiency, effectiveness, and service. The merit system was criticized as too rigid in its application of reasonable opportunity and how fitness for the job was determined (Kernaghan 2008). As noted in the Glassco Report,

> [t]he merit system, in many of its current practices, frustrates the attainment of the principle; in its name many absurd procedures are tolerated; the system has become an end in itself; overriding the need to 'get the job done'; and all too frequently it has engendered such delays in the attempt to get the "best" man that his loss to a more nimble employer was ensured.

Another area highlighted by the Glassco Report was representation, particularly for Francophones in the public service. The Glassco Commission, while charged with examining public sector reform more generally and how to control a burgeoning bureaucracy, was also charged with examining the role of Francophones. When the report from the Commission was released, it stated that Canada's bilingual and bicultural character was not reflected in the public service, and that Francophones were barred from participating at the same level as English Canadians, given that English was the dominant, if not the only language used across many departments, agencies, and even the armed forces (Kuruvilla 1973).

Up until this point, the concept of merit and the concept of representation had developed and evolved quite separately, both in the Canadian context and in academia as well. Yet Glassco changed this, addressing both issues as key areas that needed to be improved within the Canadian public service.

The Glassco report subsequently spurred the creation of the Royal Commission on Bilingualism and Biculturalism in 1963, which was tasked with examining the utilization of bilingualism in all departments, branches, and agencies of the federal public service, and to make recommendations designed to provide protection and respect for the bilingual and bicultural nature of the federal public service (Kuruvilla 1973). The Committee's report, released in 1969, argued that French should become a language of work in the public service, and that the public service should better reflect the linguistic and cultural diversity of the broader Canadian society, and that Francophones, in particular, should be statistically represented in the

public service at a level similar to their percentage of the total Canadian population.

Unlike other public service reform commission reports, the recommendations of the Bilingualism and Biculturalism Commission were swiftly adopted through the 1969 *Official Languages Act*. This Act established bilingualism and biculturalism in the federal public service by recognizing English and French as the two official languages of operation. Further, this Act required that each department adopt certain measures to ensure that the public could obtain services in either language if needed, that certain regions be designated as officially bilingual in terms of language of operation and service delivery, and that a Commissioner of Official Languages be created in order to ensure application of the Act.

More specifically, in terms of hiring procedures, language ability became considered a skill, and positions were categorized as English only, bilingual, or French only, thus utilizing merit as a tool for increasing the representation of Francophones (Kübler et al. 2011; Turgeon and Gagnon 2013a, b). For those who were already employees, language training programs were established in order to increase the number of bilingual employees, particularly at the executive level (Kernaghan 2008).

As a result of utilizing language abilities as a merit tool, and designating certain positions as bilingual or unilingual French, the percentage of Francophones within the Canadian public service rose dramatically at all levels. In fact, by 2009, Francophones actually represented more of the core federal public administration than their total percentage of the Canadian population. In that year, while 23.6% of the population identified as Francophone, 27.1% of the public service as a whole, and 31.5% of executives identified as Francophone (Turgeon and Gagnon 2013a). Thus, it can be stated that in this case, the use of merit as a tool to increase representation was quite successful in the Canadian case. This should be interpreted with caution, however, as it is reported that English still tends to dominate as the language of many organizations (Kübler et al. 2011).

The debate over how to balance representation with principles of merit in the public service in Canada did not end with the results of the Bilingual and Bicultural Commission, nor was it only discussed in conjunction with increasing Francophone representation. This discussion was furthered with the commission of the D'Avignon Special Committee on the Review of Personnel Management and the Merit Principle in 1977. The committee was assembled in order to examine the concept of employment equity in the face of growing discriminatory practices towards minority groups. A core question the committee was tasked with was how to deal with discrimination and increase representation without dealing with the failures of policies like affirmative action (D'Avignon et al. 1978). Affirmative action was a practice widely adopted in the US, and was experimented with in a few places in Canada. In addition to other various requirements, affirmative action requires legally imposed minority hiring quotas for employers. A number of problems have been linked to affirmative action, including employee dissatisfaction, resentment, anger, and miscommunication, as well as accusations of reverse discrimination, whereby people of the dominant group feel that they are discriminated against, or passed over in favor of less qualified minority candidates.

In the wake of the failures of affirmative action in the US and elsewhere, the D'Avignon Special Committee sought a different solution from legally mandated quotas, one where representation could be increased but without completely abandoning the merit principle. Rather, the Committee argued that merit needed to be balanced with other core public service principles, including representativeness and equity. In this regard, the Committee recommended that merit, in certain cases, could be suspended in cases of special treatment for members of designated groups, and that certain qualifications could be deferred that could be later learned on the job (D'Avignon et al. 1978). Such designated groups were created in order focus on increasing representation of historically disadvantaged groups, namely women, visible minorities, and Aboriginal persons, with a fourth group, persons with disabilities, added years later.

Examples of balancing merit with representation for these designated groups included such practices as encouraging participation in volunteer activities, and then valuing such activities as a form of experience, as well as offering training courses and adapted tools, particularly for those with disabilities in order to make not only entry level positions more accessible, but also to make promotion more attainable. For Aboriginals in particular, especially for those working in Northern regions, traditional bureaucratic requirements such as education levels were waived in exchange for different types of requirements like knowledge of Aboriginal languages and customs (Juillet and Rasmussen 2008).

As a result of these Committees and their subsequent recommendations, the statistical representation of previously underrepresented groups has been increased throughout the public service, both as a whole and at the executive level. More specifically, as of 2016, within the core public service, 54.4% are women, 14.5% are visible minorities, 5.6% are persons with disabilities, and 5.2% are Aboriginal peoples. This is compared with 47.3% women, 9.4% visible minorities, 3.7% Aboriginal peoples, and 5.1% persons with disabilities at the executive level. This is in addition to the aforementioned increased percentages of Francophones. Thus, although more efforts need to be made in terms of reaching full representation at the executive level, through balancing various merit and representation hiring principles, the Canadian federal bureaucracy has made great strides in achieving a more representative bureaucracy.

The issue of representation continues to grow in importance. Over the past 20 years, Canada's population has diversified greatly, with approximately 19% belonging to a visible minority and over 20% born outside of Canada (Statistics Canada 2011). The number of visible minorities is expected to continue increasing, as immigrants are coming in greater numbers from areas other than Western Europe. Specifically, as of 2011, 56% of all new immigrants hailed from Asia and the Middle East, 12% from Africa, and 12% from the Caribbean, Central and South America (Statistics Canada 2011).

## Conclusion

To conclude, representative bureaucracy, although it may have its weaknesses and detractors, has played a fundamental role in the development of the Canadian public service. In a country so geographically large and diverse, with multiple founding peoples, providing access to government services has had, and continues to have many challenges. Presenting a public service that is representative of this diversity is a key focus in conveying accessibility to services. Such representativeness has been a major commitment on behalf of Canadian federal governments since the 1960s, and achieving this representation has required innovative and unique practices, including a clear linkage between merit and representation. The commitment to these principles has varied since the 1960s, but both remain core to the functioning of the public service to this day. And due to the increasing heterogeneity of the Canadian population, continued pressure will be placed on the public sector to accommodate and be responsive to this growing diversity, thus enhancing the need to balance merit and representation.

# Representative Bureaucracy in Ghana

Elijah Agyapong
Robertson School of Government, Regent University, Virginia Beach, VA, USA

## Synonyms

Active and passive representation; Bureaucratic responsiveness; Education; Gender

## Definition

Bureaucratic responsiveness:

> "Matching bureaucratic outputs as closely as possible with expressed client wishes" (Saltzstein 1985, 300). A responsive bureaucracy is one that is attentive and sympathetic to the specific needs of the public and seeks to fulfill those needs.

## Introduction

Over the past six decades, representative bureaucracy has emerged as one of the viable avenues to ensure that the bureaucracy in a democratic system of government is responsive to citizens. Unlike other frameworks of bureaucratic accountability and responsiveness – e.g., political control and citizen participation – the concept of representative bureaucracy focuses on changing the social composition of the public service to make it a microcosm of the population. Advocates of this idea argue that adequate representation of ethnic and racial minorities and women in the public service can engender responsiveness to the needs of these historically marginalized groups, provide equal access and opportunity for minorities to participate in and influence bureaucratic decision-making and policy implementation, and enhance the democratic legitimacy of the bureaucracy (Mosher 1982).

A sustained scholarly interest during the past four decades, especially in the United States and the United Kingdom, has produced an extensive body of theoretical and empirical research with overwhelming consensus that a representative bureaucracy accrues substantive benefits to minorities and women in the population (e.g., Keiser et al. 2002; Andrews and Miller 2013). While the literature in the United States and other developed democracies continues to grow, it is unclear whether and in what ways findings from these studies apply to developing democracies, especially in Africa. For instance, recently, researchers have pointed to the positive effects of educating girls on economic growth. Would hiring more women within the education

bureaucracy help to increase educational attainment of girls in a developing democracy like Ghana? It is difficult to make a prediction from the existing literature because we know so little about whether the theoretical assumptions of representative bureaucracy apply in the developing world. Identities related to gender and ethnicity are not, for instance, the same in Africa as they are in the United States nor is the civil service. Yet, there are reasons to expect that the theory might apply. Gender is an important identity in Ghana, and educators have the discretion to act in ways that could be beneficial to girls. Moreover, affirmative action to promote girls' education in Ghana has been quite successful compared to a broader national agenda for gender equity in political appointments (Tsikata 2009). The case of girls' education, therefore, provides an important avenue to examine the assumptions of representative bureaucracy in Ghana.

## Theory of Representative Bureaucracy: Passive and Active Representation

Because the literature of representative bureaucracy has been discussed in some detail in this volume, this section focuses narrowly on the theoretical assumptions and linkages that underlie most of the recent empirical work on the subject matter. A fundamental assumption of representative bureaucracy is that *passive representation* or the extent to which the bureaucracy is a microcosm of the larger society in terms of its demographic composition would lead to *active representation* whereby individual bureaucrats advocate or press the interests of social groups with whom they share similar identities in ways that produce substantive benefits for that section of the population (Mosher 1982).

The credible underlying mechanism linking passive and active representation is the assumption that individuals who share similar social origins and demographics will also share similar socialization experiences. These experiences can lead to the development of similar beliefs and values that, in turn, can influence behavior (Meier and Nigro 1976). For example, the theory suggests that, based on shared beliefs and values, female bureaucrats are more likely to represent the interests of females in the population than their male counterparts.

## Intervening Conditions and Contingencies

Scholars have noted, however, that the question is not so much whether a link exists between passive and active representation but under what circumstances the relationship exists. One reason why the relationship might not be linear is organizational socialization. Socialization into formal bureaucratic roles can lead individuals to adopt values and policy preferences that are distinct from the values acquired through childhood socialization experiences (Meier and Nigro 1976). Socialization into professional norms can hinder active representation and even lead to increased disparities against minority clientele (Wilkins and Williams 2008). However, bureaucrats can be socialized to assume a "representative role" in which case they are more likely to pursue policies that benefit the minority population (Selden et al. 1998).

Scholars have developed a more systematic framework of institutional factors that might influence the linkage between passive and active representation (Keiser et al. 2002). A fundamental condition is that bureaucrats must have discretion to shape the content of policy to benefit minority clientele. In addition, the issue or policy area must be salient to the demographic group in question. For instance, Keiser et al. (2002) suggest three ways in which a policy area can be gendered: when "(1) the policy directly benefits women, (2) the gender of the bureaucrat influences the bureaucrat-client relationship, and (3) the issue has been defined as a women's issue in the political process" (556). Other factors are stratification or the extent to which women and minorities are represented in supervisory positions and critical mass – whether the number of women and minorities in the bureaucracy is sufficient for them to develop advocacy roles.

## Representative Bureaucracy in Ghana

The few extant studies on representative bureaucracy in sub-Saharan Africa have focused on passive representation. Generally, countries that have adopted affirmative action policies have fared better in terms of the level at which ethnic minorities and women are represented in the public sector workforce. Gender has arguably become a more salient identity than ethnicity in Ghanaian politics since the end of colonial rule. Although Ghana's first republic government embarked on comprehensive affirmative action programs, the parliament of the fourth republic is yet to enact a formal legislation. The current 1992 Constitution of Ghana, however, includes various provisions, especially articles 27 and 35(5,6), that address women's right issues as well as gender and regional balance in the recruitment and appointment to public offices.

More significantly, an administrative directive issued by Ghana's cabinet in 1998 specifically targeted women. For instance, the directive sets quotas for 40% female representation on boards, 40% in parliament, and 30% of the membership of District Assemblies and includes measures for improving girls' education. Despite these policy initiatives, Ghana's public service is not representative of the population in the passive sense. Women are significantly underrepresented in management and political positions across all public sector institutions (Allah-Mensah 2005). Indeed, while women currently constitute about 51.2% of the population in Ghana, they only make up about 32% of the civil service and 12% of the managerial decision-making category (Adusah-Karikari and Ohemeng 2014). This finding is suggestive of trends in the sub-Saharan region, although there are notable success stories such as Rwanda, South Africa, and Mozambique.

A meager number of studies have examined the possible linkage between passive and active representation in Africa. In Ghana, these qualitative studies have demonstrated that the link between passive and active representation is constrained by sociocultural, historical, and political barriers (Adusah-Karikari and Ohemeng 2014). For instance, gender-based role differentiations and a historically male-dominant institutional culture preclude women from advancing to upper-level leadership positions where they are more likely to influence policies that benefit women. Again, these barriers are not limited to Ghana but indicative of conditions in the sub-Saharan region. For example, Lungu (1989) identified similar barriers to women's participation in public administration in Zambia, while Naff and Capers (2014) emphasized challenges in defining passive representation in South Africa. In sum, there is a need for systematic empirical research to understand whether and how passive representation translates into active representation in sub-Saharan Africa.

## The Case of Girls' Education

Gender disparity in education is widespread in developing countries, but the problem is more pronounced in sub-Saharan Africa where girls suffer much discrimination in regard to school enrollment, retention, and outcomes (Shabaya and Konadu-Agyemang 2004). Within the developing world, female participation in formal education in sub-Saharan Africa lags behind countries in East Asia, the Middle East, North Africa, Latin America, and the Caribbean. In addition, school dropout rate among girls in sub-Saharan Africa is higher compared to other developing countries (King and Hill 1997). Bridging the gender gap in educational attainment is a perennial issue that continues to receive considerable policy and scholarly attention in Africa.

There is overwhelming consensus that increasing the proportion of female teachers can improve girls' educational attainment. However, less empirical research has systematically investigated the link between teachers' gender and student achievement in Africa. The available evidence suggests that female teachers are associated with girls' enrollment, dropout rates, and performance in primary schools. In Ghana specifically, there is suggestive qualitative evidence that the presence of female teachers is critical for increasing girls' enrollment, retention, and performance, as well as creating a gender-friendly school environment

(Casely-Hayford 2007). Preliminary quantitative evidence from primary schools also indicates that female teachers are significantly associated with improved test scores and school enrollment for girls (Joseph and Wodon 2012; Ahiakpor et al. 2014). These results are not surprising considering that female teachers are disproportionally overrepresented in primary schools in Ghana. The illustrative case that follows examines whether passive representation of female teachers is associated with girls' education outcomes in senior high schools (SHS) where the gender gap is more likely to be wider and female teachers are less represented.

## Empirical Test of Representative Bureaucracy in Ghana

Two specific developments in Ghana in regard to improving girls' education provide avenues to test the theory of representative bureaucracy. First, the government of Ghana has sought to increase the presence of female teachers in public schools, especially in the rural areas where gender disparities persist. This is part of the push for affirmative action. Second, a Girls' Education Unit (GEU) was established in 1997 to increase girls' participation and bridge the gender gap in educational attainment. One of the strategies of the GEU is advocacy and community sensitization toward the importance of girls' education.

Education is a gendered policy area that is salient to women as a group, especially in sub-Saharan Africa. The focus on how to make the education bureaucracy responsive to girls in Ghana therefore satisfies the theoretical conditions of issue salience and gendered policy. Similarly, teachers like most street-level bureaucrats exercise considerable amount of discretion within and outside the classroom, which can influence how students experience education (Lipsky 1980). Meier and Bohte (2001) demonstrate that teacher discretion is necessary for passive representation to translate into active representation. In short, the case of girls' education in Ghana meets the condition of bureaucratic discretion.

## Data, Measurement, and Methods

The Ministry of Education and Ghana Education Service provide a representative data on the 216 districts in Ghana, which allows us to examine the impact of female teachers on girls' education. (See Agyapong (2017) for a detailed description of the data and methodology of the empirical analysis.) Due in large part to reforms undertaken in the 1990s, e.g., the free compulsory universal basic education program in 1995 and the establishment of the Girls' Education Unit in 1997, Ghana has made significant progress toward attaining gender parity in school enrollment. This notwithstanding, girls' performance in the math and science subjects is an important area needing policy intervention. Boys consistently outperform girls in all core subjects except English. For instance, in 2012, the math pass rate for girls was 44%, compared with 55% for boys, while the pass rates for integrated science were 52% and 61% for girls and boys, respectively. In 2014 the rates increased for both gender groups, but boys still performed better than girls. Girls' pass rate on math was 68% compared to 74% for boys in 2014, while the pass rates for science were 82% and 87% for girls and boys, respectively.

Therefore, the main dependent variables for the empirical analysis are girls' performances in math and science, operationalized as *the number of girls who passed math and science subjects* in the 2013/2014 West African Senior School Certificate Examination (WASSCE). The variables constitute a measure of student outcome employed as a proxy for active representation, rather than specific bureaucratic outputs that could be linked directly to individual teachers. Theoretically, the key independent variables used to measure passive representation are the representativeness of female teachers (*percent of female teachers* in senior high schools within the districts) and the representativeness of female supervisors or organizational stratification (*percent of females in supervisory positions* in the district education offices). The assumption is that the two independent variables are positively

associated with girls' performance in both subjects.

Four control variables are included in the model: *percentage of trained senior high school teachers* (a measure of school quality), *percentage of female students enrolled* in senior high school grades 1–3 for the 2013/2014 academic year, *boys' pass rate on the math and integrated science* exams, and *percentage of the district population living under the poverty line* (a proxy for female economic hardship in the districts). Previous research has shown these variables to be related to school outcomes for girls.

## Findings and Discussions

The main variables used to assess the impact of representative bureaucracy are girls' performance in math and science exit exams. If representative bureaucracy has beneficial policy impact, we would expect that passive representation would be positively associated with girls' pass rate on math and science. Table 1 shows an expected relationship. To interpret these results, the coefficients must be multiplied by 100% since the dependent variables are natural logs. Female teachers are associated with more girls passing the math and science exit exams (a 1% point increase in female teachers is associated with a 3.9% increase in the number of girls passing the math exam and a 3.8% increase in the number of girls passing the science exam). Generally, these findings are consistent with expectations concerning active representation and suggest that the presence of female teachers improves educational outcomes for female students in Ghana.

The results did not, however, support upper-level representation. Female supervisors are not significantly related to girls' performance in either math or science. Although not significant, the weak impact as indicated by the size of the coefficient lends credence to the literature that passive representation is more likely to affect students' outcomes at the "street level" where teachers have direct responsibility and exercise considerable discretion.

The results of the analysis for trained teachers are mixed. Trained teachers are not significantly related to girls' performance in math but are positively associated with their performance in science. (A 1% point increase in teachers who have received professional training is associated with a 1.0% increase in the number of girls passing the science exam.) Substantively, this impact is

**Representative Bureaucracy in Ghana, Table 1** The effect of representative bureaucracy on girls' performance (dependent variables: log number of girls passing math and integrated science exams)

modest compared to that of female teachers. The rest of the controls were included for model specification purposes and will not be interpreted. Overall, the results offer new insight for active representation in Ghana and support the extant literature that representative bureaucracy can improve education outcomes for girls.

## Conclusion

This study examined an important question as to whether the findings of studies on representative bureaucracy in the United States and other developed democracies also apply in developing democracies, especially in Africa. Particularly missing from the study of representative bureaucracy in the sub-Saharan region are empirical studies that link passive representation to active representation. We do not know whether recruiting a representative workforce makes the bureaucracy responsive to citizens in that context. The case of girls' education provided an avenue to test the assumptions of representative bureaucracy in Ghana, particularly because (a) education is an important policy area, (b) gender is a salient demographic identity that interacts with education, and (c) teachers have considerable discretion to influence students' educational outcomes. The results demonstrate that female teachers in the 216 districts of Ghana have positive influence on girls' performance in math and science in senior high schools. This finding contributes to the emerging literature on representative bureaucracy in sub-Saharan Africa. To understand fully whether passive representation leads to active representation for women in the bureaucracy and conditions that might influence this relationship, more empirical research is needed in other street-level bureaucracies and local governments in Ghana and elsewhere in sub-Saharan Africa.

# Reputation Management in Crisis

Tham T. Nguyen
Gaylord College of Journalism and Mass Communication, University of Oklahoma, Norman, OK, USA

## Synonyms

Destination image; Restoring image; Strategic positioning

## Definition

Reputation reflects an organization's subjective and collective assessments of trustworthiness and reliability. Reputation management refers to the efforts employed to shape public perception of an organization or location by influencing and controlling information about it. Reputation management after a disaster involves utilizing image restoration practices to alter false perceptions of a damaged location and the surrounding affected communities, thereby aiding in a resilient recovery from the crisis. Reputation management attempts to suppress negative perceptions about a damaged location and highlight positive aspects about relief and recovery efforts after a disaster. Hence, reputation management aims to bridge the gap between how a damaged place portrays its recovery image after disasters and how the general public views it.

Crisis management is the process of dealing with disruptive and unexpected events before, during, and after they occur. Crisis management aims to better prepare people for a crisis, enabling them to respond to a crisis in a timely and adequate fashion, through the implementation of procedures for crisis termination, including assessing the effectiveness of crisis responses and postcrisis reflection and debriefing. Reputation management is discussed and tackled while making plans for hazard or crisis management following a disaster.

## Introduction

Reputation management after a disaster relates to what happens to communities after a crisis. Following a disaster, immediate harm and damage as well as lingering effects that require stabilizing the affected community typically occur. While response efforts aim to control damage, inform media, and maintain law and order, a second major part of reputation management occurs in the recovery stage, which includes relief aid and restoring image. The following sections describe fundamental elements of both reputation management and crisis management, as well as how reputation management after a disaster can influence individuals' risk perception and generate positive destination image.

## Reputation Management

Reputation management has been studied in a variety of disciplines. Fombrun and Van Riel (1997) outline six perspectives for defining reputation. The economic view describes reputations as either traits or signals that distinguish different organizations and their strategic behavior. This perspective considers reputation as perception

held by external stakeholders. The strategic view claims reputations are both assets and mobility barriers that contain distinct organizational characters and are difficult to imitate. The marketing view focuses on individuals' information processing that formulated cognitive and affective meaning to cues, resulting in forming their perception of organizational reputation. The organizational view examines reputation based on the sense-making experiences of employees about their organizational culture and identity and how these features affect organizational behaviors to stakeholders. The sociological view emphasizes individuals' socio-cognitive processes that formulate aggregated assessments of organizational prestige and its stratification of social system surrounding organizations and industries (Shapiro 1983). Finally, the accounting view focuses on developing appropriate measurements of reputational values as intangible organizational assets. Suggesting an integrated view, Fombrun and Rindova (1996) defined reputation as collective assessments of an organization's past performance and the ability to deliver valued outcomes to stakeholders.

Just as organizations implement reputation management plans to help them build relationships and grow their business, tourist destinations need to develop reputational capital to attract visitors and investors. A good reputation not only has intangible values but also tangible benefits that bring billions of dollars to destinations that are attractive to visitors. Successful reputation management can enhance the values of destination as well as protect it in the wake of a crisis. Failure to manage reputation can lead to costly marketing communication efforts to repair destination image. Thus, to manage the reputation of a destination, practitioners should develop a reputation management plan to measure, monitor, and manage reputational capital.

Reputation management typically focuses on managing an organization's intrinsic identity and external images (Doorley and Garcia 2015). An organization's intrinsic identity refers to what the organization stands for. External images are concerned with people's perceptions of the organizational image. Doorley and Garcia suggested a reputation management plan should include (1) internal and external audits, (2) reputational capital assessment, (3) analysis of reputation challenges and problems, (4) a statement of reputation criteria and aspiration to achieve goals, and (5) organizational message strategies. The plan serves as a strategic guide for an organization to manage reputational capital. Reputation management in a crisis follows similar mechanisms to that of organizational reputation management, with some adjustment to adapt with the rebuilding and recovery process after disasters.

Reparing reputational damage after a crisis has been discussed in various disciplines such as public relations, communications and marketing. Failure to manage reputation can cause serious harm to the recovery of an organization or a damaged location. Furthermore, crisis management incorporates reputation management activities to protect organizational or destination image and its identity.

## Crisis Management and Reputation Management

A crisis refers to a significant threat that can cause potential damage to an organization or location if it is not handled properly. It is crucial to distinguish the difference between *crisis* and *disaster*. While a *crisis* is described as the possible but unexpected result of management failure, a *disaster* is viewed as an unpredictable catastrophic change to which a response can be made only after the event, either through implementing contingency plans already in place or through reactive responses (Prideaux et al. 2003). Disaster management before a disaster occurs focuses on providing public information and resources to protect public safety. Man-made disasters such as acts of terrorism, economic crises, war, and serious social conflicts can have a tragic effect on a destination's economy and society. Natural hazards, such as hurricanes, earthquakes, tsunamis, volcanic eruptions, tornadoes, floods, landslides, and droughts, are characterized as low control and most likely

impossible to prevent, but can threaten life, property, and environment itself.

Crisis management is designed to protect an organization or location from threats and prevent or lessen damages caused by a crisis. Public safety is the primary concern of crisis responses, followed by financial and reputational concerns. Crisis management consists of three phases: (1) the pre-crisis phase focuses on prevention and preparation, (2) the crisis response phase executes response strategies, and (3) the postcrisis phase implements recovery efforts and fulfills commitments to stakeholders who learn ways to better prepare for the next crisis. Thus, crisis management consists of strategic planning to prevent and respond during a crisis occurrence that allows the organization to better control its destiny (Fearn-Banks 2016).

Crisis management plans in disaster management allow crisis managers to make appropriate decisions to execute crisis responses to protect local people as well as help affected communities to rebuild and recover after a disaster. By having the right plan and resources before a crisis occurs, officials and crisis manager can lessen damages and shorten recovery time.

Crisis management is one of the special realms of the art of public relations. Public relations practitioners are trained to handle crises to mitigate financial lost and reputation damage. Reputation management during a crisis aims to inform and alter false perceptions regarding the recovery process after disasters. Thus, reputation management is tackled in crisis management plans to regain visitor confidence in the rebuilding efforts of a damaged place and recover the tourism industry. For example, Greensburg, Kansas, used to be a tourist attraction, housing the world's largest hand dug well, but it has slowly lost population because local residents leave town for jobs in larger cities and children go away to college without returning. Yet, after an EF5 tornado hit the town on May 4, 2007, leaving 11 fatalities and demolishing 95% of the buildings, community leaders decided not only to rebuild the city but to also bring a new identity to their resilient town. Community leaders considered the tornado to be a huge opportunity to rebuild the town and make it better than before (Morris 2007). Through community forums, community leaders encouraged residents to discuss their concerns about the rebuilding and recovery process. The Greensburg city council also held regular meetings to assess ways to support current and attract potential businesses to create new jobs and new opportunities that would bring young adults back to town after graduating from college (Nguyen and Morris 2009). Community leaders had a bold vision to rebuild a green community using renewable energy. Thus, new city buildings were designed to be LEED (Leadership in Energy and Environmental Design) platinum – a very high environmental standard used worldwide. The 2007 image restoration efforts have changed a damaged place into an environmentally green town.

The Emergency Management Accreditation Program (EMAP) provides Emergency Management Standards for disaster managers. This industry gold standard includes guidance for various recovery plans by outlining short- and long-term priorities for affected areas so they can restore critical functions, resources, facilities, infrastructure, and services/programs. Planning for reputation management after a disaster suggests what a damaged place should do to restore its image, which, in turn, helps it to regain business and tourism. Through crisis communication, public education, and by providing information, reputation management during and after a crisis attempts to remove many perceived risks and much uncertainty surrounding high-impact events so community leaders in affected areas can secure greater recovery control after a disaster.

Reputation management plays a significant role in relief and recovery efforts in the aftermath of a disaster. Governmental organizations, nonprofits, nongovernmental organizations, and volunteers undertake immediate relief efforts to provide essentials to help local people regain their livelihood. The recovery efforts should also discuss various broader policy issues to regain business and re-boost tourism. By providing

up-to-date information through the media, recovery activities attempt to alter perceptions of risk and destination image.

### Perceived Risks and Destination Image

Strong risk-related concerns surrounding a certain place can shape negative perception about its identity. The aftermath of disasters can cause social, physical, economic, and environmental damage to affected communities. Besides helping them maintain essential elements of their lives, governmental officials need to understand the mechanisms and the compound effect of risk-induced stigmatization surrounding the destination. Potential business investments and the tourism industry are highly sensitive to risk factors stemming from the environment (Huang et al. 2008). As media can affect an individuals' perception about a destination's image, recovery efforts require crisis communication to disseminate up-to-date information via media regarding the recovery of social factors and physical facilities in the disaster area. Communications should be tailored to sending promotional messages to address current and prospective visitor concerns, alter false perceptions, counter negative image, and reinforce positive perceptions.

By emphasizing media communication, crisis responses can exert control over the secondary impact of risk perceptions on a given destination's image and reputation. Examples of reputation management during a crisis that gained extensive media coverage include recovery efforts after Hurricane Katrina and the 9/11 attacks. After Hurricane Katrina in 2005, people thought of New Orleans, Louisiana, as a damaged place and did not want to go there for business meetings or tourism. Efforts made in 2006 at the annual Mardi Gras festival were a crucial symbolic action that brought people together for a good cause. In another example, New York was seen as a war zone after the 9/11 attacks, so theaters offered free showings to first responders to demonstrate their readiness to entertain all audiences. Governmental bodies also communicated with the general public about efforts to maintain safety and physical security to prevent similar disasters. By Christmas, hotels were almost fully booked for holiday events, as usual. Flint, Michigan, on the other hand, looks like a poorly managed city in the wake of its water issues. At this time, relief efforts to provide safe drinking water and support affected residents battling health issues are still ongoing. Yet, reputation management of the Flint water crisis is not a priority; thus, local people also suffer from social and economic challenges.

Destination image and reputation management are correlated, and often follow the same trend, especially in the wake of a crisis. Safety and physical security are two important elements to consider when making a business investment or choosing a tourist destination. When disaster strikes, it can disrupt the social and physical fabric of communities. Also, misleading media reports can stigmatize and misrepresent risk factors. Consequently, misperception of destination image can increase unemployment rate, reduce private sector profits and government revenue, and eventually hinder recovery process.

Destination image affects visitors' decisions on selecting a vacation destination. Misleading media coverage can cause direct economic consequences. Altering a negative image requires an understanding of visitors' concerns and costly marketing efforts to change false perception. Thus, reputation management during a crisis is a long-term effort to provide information about successful physical rehabilitation to regain visitors and attract new ones.

Hurricane Irma, followed by Hurricane Maria, has left a catastrophic impact on a patchwork of territories and independent nations in the Caribbean, Puerto Rico, and the southeastern United States. Rebuilding some semblance of life residents had before these natural disasters is predicted to be a long-term effort. Officials and residents must grapple with a daunting economic challenge to rebuild these popular tourist destinations. Previous risk perception of these islands consists of seasonal dangers posed by hurricanes and tropical storms. Yet, the total devastation the two hurricanes wreaked on some of these islands may prevent tourists to visit the damaged places, or worse, residents may leave the islands as they

seek a safer place to live. Government bodies play a key role in providing humanitarian services for affected communities. A key part of reputation management during a crisis is preventing the fragmentation of local culture and maintaining local characteristics in the rebuilding of a damaged place. Thus, coordination and cooperation among public bodies as well as nonprofit and private organizations are fundamental to maintaining community spirit.

## Conclusion

Crisis management is situation-based and consists of defined roles, responsibilities, and processes related to organizational requirements to prevent, alleviate, and overcome consequences caused by crisis situations. Disasters can pose daunting economic challenges for affected communities. A tough question for leaders and residents alike is how to rebuild a damaged place after a crisis. Affected residents try to find ways to not only rebuild their lives but also get back to work. Yet, the perceived risk of a damaged place can prevent tourists and businesses from traveling there. Officials need to execute a recovery plan to keep the economy afloat by providing up-to-date information via media to avoid misperception of a location's risk factors.

Reputation management in a crisis allows for the implementation of holistic, active approaches for mitigating the stigmatization of tourism after a disaster. Extensive media coverage can cause misleading information when news revolves around damages and ignores other businesses that are still open. Without managing reputation after a disaster, severe social impacts and economic devastation can occur. Thus, reputation management during a crisis aims to have a positive effect on tourism and business recovery over the long term.

To recap, incorporating reputation management into crisis management enhances the recovery efforts and the associated tourism industry in affected communities while shielding them from negative consequences. The ultimate purpose is to influence individual risk perception, protect and rebuild a positive destination image, portray the destination as a safe place for tourism and businesses, and redevelop facilities and the destination's functionality to support local businesses and tourism industries. Reputation management during a crisis needs to lessen a disaster's impact and retain public trust for the safety and physical security of a destination while it recovers.

| Higher education system | The set of organizations (doctoral universities, research intensive institutions, non-doctoral granting institutions, liberal arts colleges) that provide education at an advanced level |

## Introduction

Higher education systems have been promoting internationally the relevance of research over the past decades. Putting research achievements center stage serves a range of purposes. First, research has a positive influence on national development. Research is in fact considered to be the "engine of growth" of countries: the generation of ideas through theoretical and empirical studies provides impetus to the provision of products and services for the collective. It is noteworthy that research as the foundation of economic and social advancements applies to heterogeneous fields, although different outcomes can be expected of them. Research in science, technology, engineering, and mathematics fields, also known as STEM, can prompt the introduction of new solutions able to better human life from a practical point of view, such as new transportation arrangements, new information and communication technologies, or new materials. In parallel, research in medicine can convey new treatments and drugs to handle pathologies and improve early detection and cure of diseases. Concerning social sciences and humanities, their contributions are basically aimed at comprehending social dynamics and reducing the potential for conflict.

Second, attention for research performance can increase transparency and accountability of university functioning, in line with the values undergirding New Public Management. New Public Management can be interpreted as the application of business concepts and practices to the handling of shared resources. Specifically, performance measurement is a core practice of New Public Management that, when implemented in universities, primarily focuses on research assessment. Research outcomes can in fact be the object of appraisal, although their evaluation is not straightforward, as will be detailed below; consequently, performance-based measurement systems have been designed and are currently used in most higher education systems to streamline and distribute resources at the organizational level.

Third and relatedly, since the 1970s, a series of widespread economic crises have occurred that have required governments to cut on costs and raise overall efficiencies. Placing emphasis on research performance allows university management to realize what activities are conducive to satisfactory outcomes and deserve allocation of a larger set of resources and what, conversely, can be ruled out or downsized (Martin 2011). To this goal, many countries run regularly national evaluation exercises, such as the British Research Evaluation Framework (REF) and the Italian Valutazione della Qualità della Ricerca, to realize what performance different universities, schools, and departments have attained in a given time length. In particular, the British evaluation process has acted as a reference for the setup of various assessment exercises (Rebora and Turri

2013). The REF entails a structured process in which after the previous evaluation, results are published, with the definition of the initial decision of the funding bodies, and leads to the definition of submission criteria and guidelines. The REF is based on a review process across all disciplines conducted by expert panels who define the quality profile of each submission. The REF adopts a system of four-starred quality levels which have become popular: research outputs are classified according to their "originality, significance, and rigor" from world-leading quality (four stars) to quality recognized nationally (one star). Research evaluation can be centralized, as is the case with the above examples, or be decentralized at the single institutional level, as happens with the United States' universities.

## The Assessment of Research Performance

Gauging research outcomes is a complex and demanding process. Research performance can be traced back to two core dimensions: quantity and quality of publications. Altogether, quantity and quality of research are deemed to be linked to social and economic advancement: the more productive scholars are and the more valuable their contributions turn out to be, the likelier it is that they bring about change that is meaningful to society.

Quantity refers to scientific productivity, i.e., the number of products that a single academic has carried out in a defined period. Scientific productivity is therefore a count of products that calls for thoughtful basic choices, though, in the design of evaluation systems. Products are often classified in order to be valued, but classification criteria vary from system to system. A possible way of taking into account the publication record is to employ lists of distinguished outlets: this happens with the Academic Journal Guide elaborated by the British Association of Business Schools, which ranks journals in each area according to four, three, two, and one star, as well as in Italian social sciences and humanities fields, for each of which a national committee issues a list of A-ranked journals and a separate list of less prestigious, but nonetheless to be considered as scientific, journals that are periodically revised. An alternative method to identify eligibility of publications for a significant count is to resort to publications on indexed sources. This implies that publications making up productivity are retrieved from international database like Scopus and Web of Science that cover up a large number of journals, lecture notes, and proceedings in different disciplines according to the specified criteria for eligibility (Baruffaldi et al. 2016). This choice has been embraced in Italian STEM fields, for example, which rely on these sources in the national qualification exam necessary for career progressions. The quantity dimension of research performance therefore holds some link to quality, although this latter is also assessed independently from quantity. Quality in fact is aimed at grasping scholarly influence in the scientific community, which can significantly differ from productivity. Influence is related to the impact that an author's contributions convey to the reader, which can act as a proxy for their potential relevance to the larger collective. Influence is measured according to several different indicators. Among the most used bibliometrics rank the number of citations, the h-index, and the journal impact factor.

The number of citations measures the references made to a given article, book, chapter in book, or other published item in different publication outlets. The overall number of citations that a researcher has received at a given point of time is considered to account for his or her impact on other scholars' work. Since citation distribution tends to be skewed, the average number of citations per publication, the number of highly cited publications, and the proportion of highly cited publications to the overall number of publications can be used to grasp influence, too. Similarly, the number of citations can be calculated at the department level to appraise a collective, instead of individual, influence (Waltman 2016). It has to be noted, though, that a time effect should be considered regarding citations. They tend to cumulate over time, so that recent works are usually less cited than older ones: the influence of a scholar at a certain moment can ensue from past outstanding research outcomes rather than from recent effort. This observation has led some

evaluation systems to adopt a so-called citation window, e.g., 5 or 10 years after the publication date, as a frame of reference. Conversely, a phenomenon of "delayed recognition," i.e., publications that remain largely overlooked for a long time before becoming prominent and attracting citations, has been also explored.

The h-index, or Hirsch index, is defined as follows: a scholar has an index equal to h if he or she has h publications with at least h citations each, while the remainder has received fewer than h citations. The higher the h-index, the stronger the influence that a scholar exerts. Finally, the impact factor applies to journals, instead of individuals. The impact factor calculates the ratio between the number of citations that a journal has received in a given year for the papers that it has published in the preceding two years and the sum of the papers that the said journal has published in the same two years (Garfield 2006). The underlying assumption that individuals who have published papers in journals endowed with high impact factor are influential in knowledge production is still much debated. A major criticism lies in the fact that being accepted by a highly impactful journal is not equivalent to producing a highly impactful piece of research, since, once again according to a skewed distribution, a minority of papers usually receive the largest number of citations in a journal, and they tend to be reviews of literature or articles written by already distinguished scholars.

The evaluation of research performance depending on scientific productivity and scientific influence, albeit important to comprehend the suitability of research to promote higher education and national system advancement, is replete with shortcomings. Differences across fields are relevant: bibliometrics are more suitable for hard sciences than for social sciences and humanities, which have a national and regional orientation and mostly rely on books instead of journals as outlets, while conference proceedings are common publication outlets in fields like computer science and engineering. Comparisons of scientific productivity and scientific influence across various fields are therefore complex and even inappropriate.

Criticism has addressed the repositories of information as well. Indexed sources such as Scopus and Web of Science are believed to be scarcely inclusive and to leave uncovered unconventional, but often innovative, publication outlets. The opportunity to resort to more open databases like Google Scholar, which are not subscription-based and collect contributions from a larger set of publication outlets, has been claimed, as they pose fewer constraints on publication selection, thus embracing a wider vision of knowledge sharing. Drawbacks in research performance evaluation have been identified in the features and content of available databases, too (Waltman 2016). Missing citations have been detected in subscription-based databases as well as inaccuracies in author identification that negatively affect research performance assessment. In addition, this latter is influenced by the number of authors per publication that tends to be particularly high in certain fields like energy physics and biomedicine. Under these circumstances, attributing all the citations to each author risks inflating citation counts compared to other fields. Another mechanism that puts at stake a reliable estimation of research influence is the use of self-citations, which increase the count of individuals' citations without expressing a real impact on peers' work. At the same time, also open databases are far from being flawless. Google Scholar, for example, has been argued to lack in transparency about the sources it draws from, in comparison to subscription-based databases that clearly report on the list of sources they avail themselves of. Consequently, quality control appears to be weaker.

Based on the above factors, decisions made depending on research performance at an institutional level, such as resource allocation, but also at an individual level in terms of career progression, may be biased.

## The Relationship Between Research Performance and Other Knowledge Transfer Activities

The search for satisfying research performance is intertwined with the enactment of other academic tasks and roles that are useful to society. The relationship between the different knowledge

transfer activities that higher education institution are called to engage in has been largely discussed. Among knowledge transfer activities are placed research, teaching, consulting services to private and public companies, patenting, and spin-off creation. Altogether, they represent the heterogeneous channels through which universities share knowledge and convey value to society according to a multi-stakeholder view of higher education systems (Aguinis et al. 2014). Different knowledge transfer activities can in fact be complementary, substitute, or independent of each other. The relationship between research outcomes and commercial exploitation is still controversial and likely depends on the discipline at play: while some complementarity can be found between research and patenting and spin-off creation in the STEM field, academics' capability of attaining good research performance has emerged to be negatively related to collaboration with the industry through consulting services in social sciences, (Rossi and Rosli 2015; Salter et al. 2017). Competing requirements and the difficulty to bring to convergence the rigor underlying research and the impact expected of other types of knowledge transfer have been claimed.

A complex interplay applies to the interplay between research and teaching. According to the Conventional Wisdom model (Hattie and Marsh 1996), research and teaching are complementary knowledge transfer activities since research imbues teaching with contents, while teaching drives the scholar to make issues comprehensible to a diverse audience and can yield hints to expand further on research topics. Conversely, the Scarcity model posits that research and teaching be substitute for each other, as they imply different abilities and vie for scant resources like time and effort: the former is about identifying an original contribution to convey to the scientific community, whereas the latter concerns communication skills and the ability to translate theoretical themes into accessible and practical problems to be solved. Remarkably, knowledge transfer activities ensuing from academia that could benefit the larger collective can turn out to be at odds with each other.

Finally, the growing focus on research performance is believed to affect also the service, also labeled as academic citizenship, that the faculty carry out for and on behalf of their institution, such as public service (e.g., involvement in public and nonprofit organizations' boards, participation in public debates, acting as representatives on social media), institutional service (e.g., membership of committees and Senate, directorship of undergraduate and graduate programs), and discipline-based or professional service (e.g., entering conference committees, acting as journal reviewer or associate editor). Devoting time and attention to activities that are vital for university functioning and thriving is deemed as a distraction from the core of the academic profession, i.e., research (Vogelgesang et al. 2010; Lawrence et al. 2012).

## Conclusion

This entry has delved into the rationale for the growing centrality of research performance in higher education systems. The main reasons lie in the conviction that better research performance is able to promote economic development as well as in the need of more transparency and accountability in public resource management and in the pressure to reduce costs and increase efficiency. The assessment of research performance is a complex process that requires that scientific productivity and scholarly influence be carefully taken into account. It is noteworthy that the pursuit of excellence in research may jeopardize a successful fulfillment of other knowledge transfer activities, such as patenting, spin-off creation, and consulting, in various fields, while also compromising academics' willingness to undertake service on behalf of and for their institution.

# Residential Mortgage Foreclosure

Yanmei Li
School of Urban and Regional Planning, Florida Atlantic University, Boca Raton, FL, USA

## Synonyms

Mortgage default; Mortgage delinquency

## Definition

Residential mortgage foreclosure is the legal process where a mortgage lender attempts to recover the loan balance through repossession and sale of the collateral assets (the real property in this case), when the mortgage borrower fails to repay the mortgage based on an amortization schedule. Foreclosure laws vary in different countries and in different administrative boundaries in a country.

## Introduction

Foreclosures have been widely practiced throughout the world. Foreclosures can be applied to many types of liens, such as unpaid liens associated with mortgages, contractors' bills/mechanic's liens, homeowners' association (HOA) membership dues, and property taxes. All these indicate that if the homeowner or the general contractor fails to pay any bills related to the home, the creditor often has the legal rights to file claims to the real property, even though the homeowner may not be the one directly responsible for the bills. For example, if the general contractor fails to pay the subcontractors or the suppliers of the materials, the creditors may claim the legal title to the house. Mechanic's liens related to personal properties, instead of real properties, can be filed as well. Members who fail to pay the HOA dues or homeowners failing to pay property taxes may be subject to foreclosures as well. In the situation of mortgage foreclosures, the borrower of the mortgage fails to pay the monthly payment, and the lender has the right to repossess the property. Without foreclosures the borrowers can often reclaim the legal title of the property if they pay back the unpaid balance, even though the lender is still the lien holder. Therefore, if there are no foreclosure proceedings, repossession of real property due to mortgage default, which is usually defined as more than 3 months behind in mortgage monthly payment, only guarantees the lender the legal title, not the equitable title, of the property. Through foreclosures, the lender secures both the legal title and the equitable title of the property.

Residential mortgage foreclosures exist throughout the world, but the most recent and notable episode of the mortgage foreclosure crisis happened during the "Great Recession" (2007–2009) in the USA. The primary reasons for the foreclosure crisis are related to "exotic" mortgage products and the bust of the housing

markets after the boom during the early 2000s (Immergluck 2008, 2009). "Exotic" mortgage products are often mortgages with high interest rates, lower loan-to-value (LTV) ratio (the proportion of mortgage principal to the purchasing price of the real property), and some other features that might lead to a higher likelihood of default. In a broader sense, mortgages are classified as prime and subprime mortgages. Subprime mortgages are part of the "exotic" mortgages with higher interest rates, often issued to borrowers with impaired or insufficient credit history. Sometimes subprime loans are predatory. Schwartz (2015, p. 87–88) and Immergluck (2008, 2009) defined exotic mortgages as those with unusual terms and conditions, such as an adjustable interest mortgage with an extremely low "teaser rate," an interest only mortgage for a specific time period, balloon payment (e.g., interest only first but a lump sum pay back with a short loan term), payment options where the borrowers can pay less in the beginning, and mortgages based on unverified income. Many of these mortgages create payment shocks and then result in higher delinquencies, more defaults, and higher foreclosure rates of real properties. Delinquency happens when the mortgage holder skips at least one monthly payment. Default is usually defined as missing at least three payments.

To repossess the property, the lender has the right to initiate the foreclosure process when the mortgage holder is in default. In some states in the USA, the foreclosure procedure is judicial, while in others the procedure is nonjudicial (often called a trustee's sale). The mortgage holder usually has redemption rights, although different states have differing legal procedures in redeeming the property. Judicial foreclosure procedures take longer time to complete than nonjudicial procedures and at times may take years. It is believed that subprime and other "exotic" mortgages were mostly the reasons for foreclosure during the initial stage of the most recent recession; later, however, job losses associated with the recession became one of the primary reasons for foreclosure.

## Spatial Patterns of Mortgage Foreclosure

The residential landscape of the USA is different from many other countries. Income, class, and racial background are closely related to each other. Racial minorities, usually African American or blacks, tend to have lower income and lower homeownership rates and concentrate in certain parts of a city or metropolitan area. Mortgage discrimination was widely practiced prior to the civil rights movements in the 1960s. The Federal Housing Administration (FHA), which was established in 1934, had encouraged mortgage redlining and other discriminatory real estate practices until the 1960s. Mortgage redlining means that certain neighborhoods, often high-minority neighborhoods in inner city areas, were targeted to be excluded for mortgage lending. Therefore, residents from these types of neighborhoods were not able to secure credit to purchase real properties. With increasing suburbanization, wealthier people were able to flee away from inner city areas for a better built environment and a higher quality of life. "White flight" and mortgage redlining left many minority neighborhoods in limbo. Years of disinvestment devastated many of these neighborhoods and made them poverty and crime ridden.

After the 1960s, with the notable establishment of the US Department of Housing and Urban Development (HUD) in 1965, Fair Housing Act of 1968, the Home Mortgage Disclosure Act (HMDA) of 1975, and the Community Reinvestment Act (CRA) of 1977, mortgage and credit access in minority neighborhoods became much easier than before. However, these neighborhoods later then became the target of "green lining" where many homebuyers received "exotic" mortgage products when they were not qualified to receive prime mortgages (Li 2011). The unwanted consequences of green lining increased mortgage default and foreclosures. Therefore, when subprime and predatory lending is concentrated in low-income minority neighborhoods, mortgage foreclosures are consequently concentrated in these neighborhoods as well. The concentration

of renters, low-income residents, crimes, deteriorated infrastructure, and residential mortgage foreclosures caused these neighborhoods to further decline. Many of the foreclosed housing units were converted into rental housing when investors rushed to purchase the deeply discounted properties during the deepening period of the recession and the foreclosure crisis. Even though the demand in these neighborhoods may not be as desirable as in other neighborhoods, the conversion of owner-occupied units to rental units may yield positive, or most likely negative, impact on the neighborhoods.

Broadly speaking, large metropolitan areas were often more affected by recessions than smaller and rural areas. In the USA, large metropolitan areas with the highest price increase during the housing boom and a larger surplus of housing units saw the most foreclosures. The top foreclosure markets in the USA were concentrated in the Sunbelt, mostly Florida, Arizona, and California. However, tight and hot housing markets, such as the San Francisco-San Jose metropolitan statistical area, did not see a large amount of foreclosures. After the recession, many Sunbelt housing markets with strong housing demand recovered fairly quickly.

## Impact of Mortgage Foreclosure

Residential mortgage foreclosures have a profound impact on individuals, families, organizations, neighborhoods, and communities. In most situations, the impact is negative. The foreclosure crisis, combined with the collapse of the housing market in certain areas, may possibly contribute to a recession. The magnitude of the "Great Recession" during 2007 and 2009 in the USA was nearly comparable to the "Great Depression" during the early 1930s. Unemployment climbed, and in 2010 the USA had the highest unemployment rate (9.80%) since the 1980s. Eventually with the intervention of federal policies and the natural decline of residential mortgage foreclosure rates, the US economy is slowly recovering, and the unemployment rate in 2017 has decreased to 4.30%.

The direct impact of mortgage foreclosures is on individuals, particularly those who borrowed the loan and those who invested in the secondary mortgage market. When a homebuyer borrows from a financial institution to purchase a home, after the origination the mortgage is often immediately bundled along with other mortgage products and sold in the secondary mortgage market. In the USA, the "big three" GSEs (government-sponsored enterprises), Fannie Mae, Freddie Mac, and Ginnie Mae, are usually the buyers of these mortgages. Later these GSEs sell the mortgage-backed securities or collateralized mortgage obligations to individuals or organizational investors. The default risks of these mortgages are then passed from the financial institutions which originated the mortgages to investors in the secondary mortgage market. These financial institutions now become the servicer of these mortgages.

Research finds that individuals who went through mortgage foreclosures have increased stress and impaired credit scores and history, and some have slipped into clinical depressions (Cagney et al. 2014). The family members of those individuals were affected and suffered as well. Many households were forced to enter into the rental market after losing their homes to foreclosures, which created or deepened the shortage in rental units, particularly lower-income housing units, and drove up rents. The rental market was less affected by the foreclosure crisis; on the other hand, when housing prices were decreasing in many large metropolitan areas, rents in these areas kept increasing due to increased demand in the rental market. Increases in rents further deepened the housing cost burden of households and families with lower incomes. In many of the metropolitan statistical areas (MSA) in the USA, nearly half of the households, more so for renters, pay more than 30% of their income in housing and related expenses, which was defined as housing cost burdened. After the recession, overall homeownership rates dropped to the lowest point in decades. Households and families, particularly the millenniums (born after 1980), are less likely to own a home. The traditional sense of homes as investment tools was greatly challenged during and after the recession.

Financial institutions and the GSEs were some of the organizations suffering from the foreclosure crisis. Financial institutions holding mortgages in default have to repossess the property and sell it after foreclosures. The GSEs and HUD (due to FHA-insured mortgages in default) consequently become the owners of these real properties. To recover the lost financial assets and liquidify tangible assets, these organizations need to sell the houses quickly. They do not have property management experience, and many of these houses were poorly maintained and then sold as is. The GSEs created certain financial incentives to encourage homebuyers and investors to purchase foreclosed homes that they owned. Compared to market-rate houses, foreclosed homes were often sold at a deep discount. The GSEs suffered enormous financial losses during the recession, which called for reform of these GSEs.

The most visible impact of foreclosures on the society is the negative impact on neighborhoods, particularly those with concentrated foreclosures and poverty, and those declining (Li and Morrow-Jones 2010). Foreclosures have a "contagion" effect, which indicates that neighboring properties are more likely to foreclose if within a certain distance of the foreclosed properties. The "contagion" effect also means that property values for houses within a certain distance of the foreclosed property tend to decrease as well. The closer the adjacent property is to the foreclosed property, the higher the discount may be (Lin et al. 2009). Some other studies also found that residents within a close proximity of foreclosed homes tend to be less satisfied with their neighborhoods (Hur et al. 2015). Before being purchased foreclosed homes were often vacant, boarded up, less maintained, poorly manicured, and therefore became eyesores in the neighborhood. Many of the foreclosed properties were purchased by investors and then converted into rental housing units. Renters are less likely to be attached to their neighborhoods and are less likely to maintain the housing at the same level as an owner. Children from renter households are also less likely to perform well academically. Therefore, neighborhoods, particularly urban single-family neighborhoods, with a higher percentage of renters may have a decreased social capital and thus may destabilize when encountering exogenous stimuli.

Neighborhoods with concentrated foreclosures are most likely affected by the foreclosure crisis. Local communities with concentrated foreclosures are also greatly affected. In addition to the physical deterioration of houses and neighborhoods, the loss of property tax revenues due to decreased property values is one of the largest financial impacts of foreclosures on communities. Reduced tax revenues, therefore, may decrease the level of public services that local communities provide to the residents. As a consequence of declining tax revenues, the quality of public schools may decrease as well. Public schools with poor student performance are mostly in school districts with a large portion of low-income minorities. High rates of foreclosures in these school districts further contributed to the deterioration of educational quality. Tax foreclosures also increased due to financial hardship associated with the recession, when homeowners were not able to spare extra funds to pay property taxes.

Higher foreclosure rates and concentrated foreclosures resulted in stressed households and families, declining neighborhoods, and reduced tax revenues of local communities. Combined with job losses during the recession, the far-reaching impact of foreclosures on society has scarred all involved or related in the foreclosure.

## Policy Responses to Foreclosure

The recent mortgage foreclosure crisis has generated a large amount of studies on foreclosures. The crisis calls for reforms in public policies related to the financial sector. Assistance to homeowners in default and foreclosures was initiated during the Obama administration. Downpayment and financial assistance to homebuyers, particularly first-time homebuyers, were offered. Various programs were launched to help absorb vacant and/or foreclosed properties. All these efforts, although with limitations, have helped tremendously in slowing down foreclosures and maintaining the health of the financial and housing market.

The most direct reaction from the financial sectors is to tighten mortgage underwriting standards.

Green lining makes it too easy to obtain mortgages; tightening underwriting standards will screen mortgage applicants more strictly to reduce the likelihood of default among risky borrowers. Compared to the USA, other countries and regions have consistently had much lower foreclosure rates. For example, Europe had much milder decreases in housing prices during the global financial crisis and had lower foreclosure rates. Two major policy alternatives in Europe were believed to help stabilize the mortgage market. The first is that borrowers have more responsibilities than those in the USA for default on the property. In Europe, mortgages are recourse loans, which means that in addition to claiming the title to the property, the mortgage lenders also have the right to claim other assets related to the mortgage. For instance, when in foreclosure the borrowers are also responsible for the difference between the mortgage balance and the housing value. For example, a person bought a house in 2006 for 400,000 Euros; in 2009, the mortgage balance was 320,000, but the house was only worth 300,000. The borrower would then be responsible for the difference between the mortgage balance and the current housing value (20,000). In the meanwhile, the borrower could also lose the home to foreclosures. This type of requirements discourages voluntary default and foreclosures when the housing price depreciates to less than the principal balance of the mortgage. Negative equity or underwater mortgages were very common in the USA during the recession. However, many borrowers in the USA did not have to be responsible for the consequence of negative equity. Some simply walked away from the mortgage, even though they were able to make the mortgage payments financially, and were not punished. Voluntary or strategic default is less common in states where mortgage loans are recourse loans. The second type of underwriting policy that has helped many countries stay out of the foreclosure crisis is to require a high loan-to-value (LTV) ratio and to strictly enforce the policy. For example, if a borrower is required to pay a 20% downpayment based on the law in the borrower's country, the borrower cannot borrow for more than 80% of the selling price. Some countries even require up to a 50% downpayment. In the USA, conventional mortgages usually require a 20% downpayment; however, a borrower may reduce that requirement by getting a higher interest rate or paying points. Some government-insured loans, such as FHA, may only require a 3.5% downpayment even when a borrower has an impaired credit score. The "exotic" mortgage products further erode the strictness of underwriting policies. After the foreclosure crisis, a higher LTV ratio became a practicing standard in the mortgage industry. "Exotic" mortgages were more regulated, and subprime lenders received better monitoring and oversight from regulating federal agencies. Zero downpayment or a small downpayment was nearly impossible for prime and conventional loans. However, FHA-insured loans, VA-insured loans, and a few financial incentives by Fannie Mae and Freddie Mac still offered lower downpayment requirements to encourage home buying. All these loans with low downpayments, however, almost always charge a much higher interest rate than conventional loans.

The federal government, particularly the Obama Administration, has attempted to enact various policies to curb the deepening impact of foreclosures during the recession. In 2009, the American Recovery and Reinvestment Act created multiple stimulus packages and programs to help households, financial institutions, and neighborhoods which were directly or indirectly affected by the foreclosure crisis. Mortgage reduction, mortgage assistance, and downpayment assistance programs were offered to eligible households and families. Tax credit was offered to first-time homebuyers during the years in the recession and a few years afterward. The Neighborhood Stabilization Program (NSP) was authorized under the act. NSP encourages nonprofit and other organizations to purchase foreclosed or vacant properties, renovate these properties, and sell them to low- to moderate-income households. These agencies receiving the NSP grant have first-look privileges for houses owned by HUD and the GSEs. The NSP program was launched as three rounds and later became a competitive grant. The impact of NSP in stabilizing neighborhoods was less documented and researched; however, the sparse nature of the housing units in the program had very limited impacts on neighborhoods and the housing market (Abt Associates 2015).

Other incentives, such as the HomePath and HomeSteps programs under Fannie Mae and Freddie Mac, have reduced downpayment requirements and offered first-look policies for those buying their homes and use the HomePath and HomeSteps programs. However, it is not required to use these and similar programs to finance the homes when purchasing from the foreclosure inventory through HUD and the GSEs.

Another important policy initiative is to reform the GSEs and redefine their roles in the secondary mortgage market. The GSEs may refuse to purchase high-risk mortgages, which might help to prevent financial institutions originating mortgages from abusing the pass-through nature of default risks. These financial institutions may make the application screening process stricter; however, they are not allowed to engage in mortgage discrimination per the Home Mortgage Disclosure Act (HMDA).

## Conclusion

Residential mortgage foreclosure is a phenomenon that will exist in any economy; however, the recent foreclosure crisis in the USA offers some lessons for other countries. The loose mortgage standards, and later the increased unemployment, were the major reasons for the foreclosure crisis in the USA. Foreclosures have a profound impact on people and the society; therefore, policy learning, changes, and innovations are necessary in mitigating the negative impact of foreclosures. These policies include strengthening mortgage underwriting standards, homeowner mortgage assistance, neighborhood stabilization programs, and policies preventing voluntary default. However, balancing the need to encourage homeownership and to increase credit access remains a challenge to house many underprivileged people in the USA.

## Synonyms

Adolescents; African American; At-risk factors; Black; Intersectionality; Protective factors; Resilience; Social support

## Definition

| | |
|---|---|
| At-risk | Vulnerable to problem behaviors resulting from exposure to risk factors (Nettles 1991; Cox et al. 2007; Lozada et al. 2017; Cunningham et al. 2018). |
| Protective Factors | Individual, familial, social, or institutional safeguards that help an individual oppose and resist the effects of individual or environmental hazards (Calvert 1997; Clark 1995; Cunningham et al. 2018). |
| Resilience | The ability to cope and solve problems in the presence of multiple risk factors (Dillon et al. 2003; McCubbin and McCubbin 1996; Wayman 2002; Ja'nina and Longmire-Avital 2018) achieving or approaching success out of unlikely or risk circumstances. It is an ongoing process punctuated by attainment of goals along the way (Cunningham et al. 2018). |
| Risk Factors | Individual and environmental factors that correlate with the increased vulnerability to problem occurrences and negative developmental life outcomes (Attar et al. 1994; Clark 1995; Lozada et al. 2017; Cunningham et al. 2018). |
| Social Support | Caring and supportive interpersonal transactions that protects from adverse effects of stressful occurrences – the school, the community, or kinship network (e.g., peers, adults, co-workers, extended family, school counselors, teachers) providing resources that enables individuals to develop skills necessary for survival and success (McWhirter et al. 2004; Nettles et al. 2000; Viner et al. 2012; Butler-Barnes et al. 2018). |

## Introduction

Adolescents of today are confronted with global experiences like that of no other generation – global pandemic, terrorism, crime, poverty, obesity, illiteracy, a rise in racial unrest. This stage of development is typically a time characterized by developmental stressors. However, these risks can jeopardies academic achievement for African American teens who are exposed to multiple stressors such as disadvantaged environments, high crime neighborhoods characterized by violence, and substandard living conditions present more complicated challenges (Goodkind et al. 2020). At the micro, meso, and macro-level, these social factors strongly impact adolescents' health and follow them into adulthood.

Understanding the roles of the social determinist of health and how they affect adolescent resilience is foundational for understanding the health of the future adult population nationally and the economic strain of care as they age. Factors such as upward socioeconomic mobility, equity, quality education, safety, positive peer groups, spirituality, and familial supports are vital to helping black youth thrive (Viner et al. 2012). Furthermore, it is essential to understand the role of racism and racialized policy in generating additional barriers and limitations for Black youth (Goodkind et al. 2020).

Shifting from adolescence to young adulthood is a period of vulnerability for African American youth. They begin to make choices that influence outcomes over their lifespan and across various systems in their lives. This article uses the ecological perspective to understand the experiences of Black youth. Not only do the individual, family, and environmental effects provide context for their behaviors, attitudes, failures, and accomplishments but policies, cultural, social, ethnic, and racist settings within which learning, and development occur play a significant role (Viner et al. 2012; Lozada et al. 2017). Within the context of the resiliency model, this research employs an ecological perspective by considering the environment and effects on the individual

(Bronfenbrenner 1979) to examine the relationship between social support and resilience in connection to the academic experiences of African American adolescents.

The need to understand the operation and meaning of resilience in African American adolescents' lives is significant. Within the framework of this entry, resilience is conceptualized as the innate ability to cope and solve problems in the presence of multiple risk factors (Lacy 2005; Cunningham et al. 2018). The following cognitions and behaviors operationally define it: a sense of self-identity, close friendships, constructive self-improvement activities, attending church, school-related success, seeking out teachers, counselors or other adults about problems, and showing problem-solving and coping behaviors (Butler-Barnes et al. 2018; Cunningham et al. 2018; Lozada et al. 2017).

For this study, answers to the following questions guide the discussion:

1. What is the relationship between social support and resilience among African American youth in late adolescence?
2. How does gender significantly interact with the relationship between social support and resilience?
3. What types of social support influence resilience among African American youth in late adolescence?

Answers to these questions reflect the analysis, the findings, and the discussion from a demographic survey of Black youth, and subjects' responses on a survey questionnaire. Surveys consisted of the following standardized scales: The Youth Coping Index, the Student Resiliency Survey, the Young Adult Social Support Index, and the Perceived Social Support Indexes. Therefore, this article examines how social support is a critical feature in promoting resilience among African American adolescents. Consideration extends to high-risk situations and the relevance of protective factors to aspects of resilience among other subgroups identifying the environmental influences associated with adaptive coping behavior and success.

## The Significance of the Study

The critical issue is identifying the protective process and mechanisms to increase the likelihood of African American youth remaining in school and succeeding despite the many challenges threatening their positive futures (Lozada et al. 2017; Cunningham et al. 2018; Goodkind et al. 2020). This crucial examination has the potential to lead to significant interventions and processes that promote resilience among African American youth.

## Research Method

The potential to be resilient has a great deal to do with the presence of protective factors, those personal, familial, or community-based experiences that directly or indirectly affect individuals and operate to offset the potential negative consequences introduced by risk factors (Lacy 2005; Lozada et al. 2017; Cunningham et al. 2018). Butler-Barnes et al. (2018) found that if sufficient social support and social resources are present, competence outcomes are possible even in the face of chronic stressors. Social supports thereby function as protective factors and are used as the predictor variable in this study. Those positive influences like a "hardworking mom," a "praying grandmother," a mentor in the community, or an empathetic school counselor are examples of social supports (Lacy 2005; Dill 2017; Ja'nina and Longmire-Avital 2018; Cunningham et al. 2018). Positive interactions with significant individuals in the community, at school, places of work, or play an active role in limiting the effects of risk factors in late adolescence. While studies examining protective factors among African American adolescents are sparse, relatively new research addresses African American children and the social contexts in which their development occurs (Lacy 2005; Dill 2017; Ja'nina and Longmire-Avital 2018; Cunningham et al. 2018). The challenge to enable at-risk youth to succeed is great because they often experience significantly higher stress at home, at school, and in the community (Bernard et al. 2020).

Many researchers evaluated adolescent development through youths' lens exposed to significant barriers and challenges like poverty, individual and community violence, low food access, and underperforming schools – which are all socially constructed challenges maligned by racism (Goodkind et al. 2020). Most researchers consider a pathological approach and focus on how exposure to risks causes youth to engage in problem behaviors like violence and aggression, crime, drug, and alcohol use (Butler-Barnes et al. 2018; Cunningham et al. 2018; Lozada et al. 2017). Black adolescent exposure to these risk factors is often associated with problem outcomes and low academic achievement levels (Minnard 2002; Thomas et al. 2009; Cunningham et al. 2018). School failure is significant, and the need for increased social support from family, friends, and school personnel is substantial. Cunningham et al. (2018) point out that positive features within the environment decrease vulnerabilities and increase the capacity to effectively overcome adversities and thrive physically and psychologically despite difficult circumstances.

Empirical studies of resilience indicate that positive family, the wider community, social interactions with peers, neighborhood schools, businesses, and external systems can improve African American youth (Butler-Barnes et al. 2018; Cunningham et al. 2018; Lozada et al. 2017). It is essential to understand that positive social support is related to positive experiences for African American youth. Using the intersectionality, stress process model, and minority stress theory, we can conceptualize how oppression can affect one's experience. Using a combination of theories to explain this work highlights the study's interdisciplinary nature and provides a deeper understanding of resilience.

## Literature Search Strategy

From a comprehensive perspective, one can consider social support and resilience by contrasting older and more current literature on the topic. Lacy's (2005) study draws from early literature on resilience research and considers the roles of those risk factors and protective factors applicable to African Americans' experiences, and serves as a seminal guide on the topic when examining the literature. In this discussion, the terms Black and African American are used interchangeably as group names that emphasize the identified population's origins, ethnicity, or race.

The older work used articles from PubMed and EBSCO HOST, and other literature databases to substantiate this research. Information from more recent the same sources. The newer articles captured discussions on resiliency for the following populations: Black LGBTQ+ populations, Women, and Youth (as a whole). The search included key terms that produced articles related to resiliency and social support within the African Community. During this search, it was essential to incorporate an intersectional approach, intentionally choosing articles that fill gaps from the existing evidence base, focusing on generational differences in resilience, LGBTQ+ populations, and immigrant populations. The literature base on Black, LGBTQ+ populations is developing.

### Updated Conceptualizations

Consideration for other significant sub-groups facing challenges (at-risk factors) examined intersectional African American adolescent experiences to ensure a holistic understanding of Black youth challenges. For this reason, it is important to note that a discussion of updated conceptualizations of the term youth is crucial. Recent literature highlights the inclusive and intersectional needs of African American youth who identify as part of the LGBTQ+ community. Using the theoretical frameworks of intersectionality, being queer and/or non-gender-conforming, Black youth equates to higher-risk levels for despair and oppression (Colpitts and Gahagan 2016; Wittrup et al. 2019). For the Black LGBTQ+ community dealing with the compounding effects of racism, sexism, health disparities, and violence, resilience through support factors is crucial (Jones and Neblett 2016; Cyrus 2017; Evans and Erickson 2019). While frameworks such as a minority stress theory help to explain how being a Black LGBTQ+ member can lead to downstream effects, the theoretical resiliency tenants can

highlight how social support might mitigate poor mental health outcomes for this subpopulation (Colpitts and Gahagan 2016; Ja'nina and Longmire-Avital 2018).

## Findings

Current findings elucidate the literature on resilience among African American adolescents and expand foundational theoretical and empirical studies supporting how protective factors shield youth from negative influences and overall well-being. From the theoretical approach, this review serves as a strength to expanding the combined variable of social support as a protective factor. Resilience researchers identified characteristics and processes that explained the positive adaptation and resilient behaviors of at-risk youth.

To examine the relationship between social support and resilience among African American youth in late adolescence, Lacy (2005) surveyed young adults whose lives were characterized by multiple risk factors and noted when resilience protective factors like social support existed in their lives. The presence of risk factors existed on multiple levels for the study subjects, from experiences of homelessness, deferred adjudication or probation, low academic attainment to experiencing teenage pregnancy, violence in the home, or the loss of a loved one. Lacy (2005) noted a statistically significant relationship between social support and resilience among African Americans in the study's findings. By this, we see that social support is a needed and demonstrated factor for resiliency. The literature supports this premise among various subpopulations as well (Colpitts and Gahagan 2016; Hatchel and Marx 2018).

Essentially, social support is a protective factor that increases resilience in African American youth (Colpitts and Gahagan 2016; Butler-Barnes et al. 2018; Cunningham et al. 2018; Goodkind et al. 2020). Lacy (2005) found a positive relationship between social support and resilience among African American young adults. Supportive interactions, often found outside the home, remain significant for youths' optimal social-emotional growth. They can influence peers or encourage exchanges between students and teachers or other prosocial adults outside the family (Jones and Neblett 2016; Cunningham et al. 2018; Goodkind et al. 2020). Success is possible when students connect to prosocial organizations, have positive peer relationships, and experience educational processes that are nurturing and rewarding.

There are several practice-related implications the literature suggests for resiliency. First, there is a clear (Brittian Loyd and Williams 2017; Butler-Barnes et al. 2018; Cunningham et al. 2018) relationship between overall social support and increased thriving points among African American youth (Jones and Neblett 2016). A robust social support system helped young people's mental health outcomes and shore up a complimentary self-view. Secondly, within school settings, natural mentoring relationships have been documented to counter and protect against the noxious effects of school-based discrimination on academic engagement (Cunningham et al. 2018; Ja'nina and Longmire-Avital 2018; Goodkind et al. 2020). Within a resiliency framework, close mentoring relationships help youths combat discrimination. These relationships can instill a Black student's sense of racial pride and actively counter discriminatory messages. A strong sense of self, in turn, fosters resilience and higher academic achievement.

Gender significantly interact with the relationship between social support and resilience. Lacy (2005) found that the strength of the positive relationship between social support and resilience for African American youth is not impacted either negatively or positively by gender. Earlier studies indicate the importance of social support in helping African American youths regulate their sense of control, but gender has no significant influence. Young men, as well as young women, need validation and need to experience unconditional acceptance and positive regard (Cunningham et al. 2018; Ja'nina and Longmire-Avital 2018; Goodkind et al. 2020). Positive social interaction with peers enhances social integration and bonding, and students who bond in a social unit also

commit to that unifies beliefs and values (Goodkind et al. 2020).

Using multiple support measures, McMahon et al. (2011) assessed positive influences and outcomes among African American youth, finding that friends provide various forms of social support. Additionally, more recent research highlights a more specific focus on the resilience factors, particularly social capital, positively associated with increased physical and mental well-being among African American youth (Woods-Jaeger et al. 2020).

There are many types of social support that influence resilience among African American youth. Three specific types of social support identified as statistically significant predictors of resilience among the young adults surveyed:

1. Friendship support characterized by acceptance, interaction, and approval through peer relationships.
2. Supportive adults in positions of authority have significant influence and provide positive regard, a sense of connectedness that facilitates social competence and thereby serves as a predictor of resilience among African American youths.
3. Spiritual health and a sense of well-being. While it is a relatively unexplored factor considered in research on resilience, it is a significant factor, according to Dill (2017), Edwards and Wilkerson (2018).

Individuals do not have to be directly engaged in church attendance or some structural religious activity to be positively impacted by spirituality. Lacy found that students' conceptual beliefs about God (or their higher power), their relationship with God, and how God affects their world increases the likelihood of feeling supported, watched over, protected, and guided. Such feelings tend to promote more resilient behavior (Dill 2017; Edwards and Wilkerson 2018). Individuals do not have to be directly engaged in church attendance or some structural religious activity to be positively impacted by spirituality. Lacy (2005) found that students' conceptual beliefs about God (or their higher power), their relationship with God, and how God affects their world increases the likelihood of feeling supported, watched over, protected, and guided. Such feelings tend to promote more resilient behavior.

More recent literature supports Lacy's (2005) findings and does not deviate from the older literature on youth resiliency conceptualizations. Tools such as natural mentoring relationships help educators and practitioners develop interventions. According to Gooden and McMahon (2016), "getting youth involved in activities where they are encouraged to rely on each other and work together might help to foster communalism" (p. 126). Providing consistent, ongoing interactions that connect young people significantly foster thriving and resilient behaviors.

Considering the current racial context, a fourth matter is the role of racism as a risk factor. African American youths can face various forms of stressful life events due to the additional burden and stress of racism (Viner et al. 2012; Metzger et al. 2020). Wittrup et al. (2019) point out that when faced with an accumulation of negative experiences and difficult social and emotional conditions, the combination of temperament and early experiences often deprives Black youth of crucial psychological resilience resources. Yet, when African American cultural experience is present resilience is strengthened. Family history and cultural elements have helped sustain groups of people, even under oppression. Internal locus of control operationally defined as having a healthy, positive racial identity can become the vaccine that helps mitigate racism and discriminatory racial acts; engage the ability to master the obstacles. Cultural experiences and enhance the believe that one effort to pursue progressions (the ability to move forward) will not diminish in the face of dehumanization (Viner et al. 2012; Metzger et al. 2020).

For the Meso level, family education and church slash spirituality resonate as support factors that align with the resiliency theory.

1. Spirituality – Mezzo
2. Education – access to higher income
3. Family messages – nuclear and extended family messages)

Lacy (2005) asserts that African American youth who obtain support from such sources as friends, spiritual health, and academic authority figures over and above family members tend to demonstrate increased resilience despite adversity. Social support from various sources, as opposed to one or two sources, optimizes positive behavioral outcomes. Meso, Exo, and macro-level influence African American cultural experience. For this reason, future research must consider the impact of policies across time (Chronosystem) on the African American cultural experience.

## Recommendations

Several recommendations highlighting the relevance of ongoing research examining ways to build positive coping and thriving strategies among African American youth emerges out of current literature. For example, Gooden and McMahon (2016) support the premise that what is needed is additional studies examining the effects of spiritual support, particularly for African American youth. Additionally, research on the positive influences of religiosity and spirituality as a form of social support can help clergy and other community leaders find ways to increase individuals' positive coping and thrive amidst adversities.

Another area of research that warrants additional investigation is the role of social support among Black LGBTQ+ populations. The presence of adversity and isolation among this group is significant, and positive coping factors are understudied. Underserved by the mental healthcare system, subpopulations within the Black LGBTQ+ population have different social factors to impact their resiliency, but social support proved to be a commonly important element (Follins et al. 2014; Cyrus 2017; Stone et al. 2020). It is vital to understand academic literature regarding this population is minimal.

The literature supported the notion that social support and resiliency in Black LGBTQ+ communities deserve special attention (Cyrus 2017). In general, social support seems to foster resiliency among Black LGBTQ+ populations. There are various factors for Black LGBTQ+ individuals that impact their resilience – these include religious institutions, cultural gender norms, family acceptance, and having a Black LGBT community (Follins et al. 2014; Cyrus 2017; Stone et al. 2020). Still, there are no monolithic Black LGBTQ+ communities, and there are varying levels of resiliency and spirituality, and social factors that can contribute to how these communities experience social support. Additionally, the regional context may be a factor, as well. The literature advocated looking at the subcommunities within these populations separately.

Furthermore, ongoing research needs to occur regarding young black females. Ongoing research can be applied to understand resiliency within this population. Within this academic space, the newer articles focused particular attention on Black women and their resilience experiences. When employing intersectionality theory, Intersections such as living with HIV, economic status, and acknowledging systemic racism are essential in resiliency. Using the stress process model and stress theory also helps understand the multiple stressors that impact Black women. The presence of psychological resources can have a positive impact on mental health. Black women living with HIV reported higher resiliency with higher self-efficacy, higher self-esteem, and higher post-traumatic growth. Furthermore, higher resilience positively correlates with having more social support.

## Conclusion

This examination of the literature supports the theoretical resiliency model with more specific consideration for social support as a protective factor supporting positive coping strategies among a sample of African American youth. Evidence of the positive relationship between social support and positive coping is thriving when faced with adverse challenges. In earlier studies on resilience, researchers pinpointed characteristics and processes used to explain how social support attributes youth's positive adaptation and resilient behaviors facing adverse experiences.

African American youth need practical help in addressing the multiple issues that afflict their lives, which hinder them from experiencing academic and social success. The presence of social support can effectively minimize the negative influences and exposure to environmental and situational challenges. It is the teacher's role, the community worker, the service provider, and others to find ways to implement processes and experiences that empower African American youth to access resources and opportunities leading to positive change (Cunningham et al. 2018; Wittrup et al. 2019; Goodkind et al. 2020).

African American youth need to be heard and allowed to influence decision-making processes that affect their lives. By listening to young peoples' voices and seeing the world through their eyes, social workers can learn a lot about how to get things done in a way that enriches these young people's lives. Researchers find that positive out-of-home networks and participation in constructive community activities increase students' general social functioning skills.

Rather than looking at African American youth from a pathological standpoint and seeing the risk factors young people encounter as perpetual problems, human service workers should encourage policy initiatives that implement interventions with youth across multiple systems and based on an ecological model. Interventions that simultaneously support the student in the classroom, family, and community systems are essential to reduce stressors and increase social support feelings.

Finally, findings from Lacy's (2005) research provides implications for recognizing the need for culturally sensitive services geared to the realities of African American youth. Advocating for intervention strategies like mentoring programs and developing culturally relevant peer support groups designed to encourage students' appreciation and respect for the cultural experiences that may influence their perceptions of social support. Current research supports this premise and further highlights future research and practice to enhance African American youth's overall lived experiences.

# Resistance to Organizational Change

Ola G. El-Taliawi
Lee Kuan Yew School of Public Policy, National University of Singapore, Singapore, Singapore

## Synonyms

Change management; Organizational resistance; Dispositional resistance

## Definition

Behavior that opposes the introduction of new forms of operating or thinking.

## Introduction

Organizational change is a phenomenon that has been studied widely over the past decades. As organizations find themselves operating in increasingly complex environments, their very

survival often depends on their ability to implement changes necessary to adapt. However, one concept which goes hand in hand in discussions on managing change is employee "resistance to change." This entry therefore will discuss the concept of resistance, as examined in the literature.

## Organizational Change in Perspective

The study of organizational change is quite broad and has been intensely researched, drawing on principles from different fields, namely, change management, organizational development, strategic management, organizational theory and behavior, institutional theory, and others. The more complex an environment gets, politically, legally, or technologically, organizations face increased pressure to cope with such contextual forces to be able to survive. They do so through change. This rise in complexity and the need for constant change, thus, has made organizational change studies more prominent over the passing years and especially throughout the 1990s (Greenwood and Hinings 1996).

Organizational change has been defined and categorized by scholars in various ways. These definitions and categories shed light on the dynamics of "resistance"; therefore, it is essential that they be discussed here. Regarding definition, there seems to be consensus among scholars that change involves the introduction of some new form of operating or thinking (Schalk et al. 1998). It occurs with the aim of organizational adaptation to the environment and/or performance improvement (Leana and Barry 2000).

Other scholars have moved beyond merely defining organizational change and have tried to categorize it. They vary in their labeling of change, but they mostly differentiate it by scope, pace, and/or scale. Pardo del Val and Martinez Fuentes (2003), for instance, differentiate between low and high scope change, where *low scope change* is incremental and aims for improvement in small aspects, but keeps the general working framework. Conversely, *high scope change* is transformative and involves totally changing the organization's general framework. Low and high scope change is also referred to in Greenwood and Hining's typology (1996) as *evolutionary and convergent change* versus *radical and revolutionary change*.

## "Resistance" to Organizational Change Examined

The phenomenon of "resistance" has also been examined equally widely drawing from different fields including psychology, human resources, and even physics. Scholars have taken a leaf out of the physics book to symbolically define resistance as a "restraining force moving in the direction of maintaining the status quo" (Piderit 2000). Resistance to change has even been equated by some scholars to inertia (Maurer 1996). The outcome of resistance, according to Pardo del Val and Martinez Fuentes (2003), is that it could delay the change process, increase its costs, or obstruct its implementation. In his classic article on dealing with resistance to organizational change, Lawrence (1969) points out that many change initiatives fail altogether, because of unanticipated resistance to change.

According to Armenakis and Bedeian (1999), change may cause responses, such as denial and stress, which may lead employees to resist the change rather than embrace it. Empirical proof of resistance has been found by several researchers, including Zell (2003), who investigated resistance to change in a university setting. She found that the individuals studied went through stages of denial, anger, and depression before reaching a final stage of acceptance of the organizational changes taking place.

Some scholars have attempted to examine the causes of resistance at the different stages of change execution. Schabracq and Cooper (1998) argue that humans develop a set of "situated roles" or general automatic responses in their daily lives that reduce uncertainty. Thus, when organizational change is introduced, it poses a challenge to their situated roles and gives rise to stress, which might eventually lead them to resist the change altogether. Additionally, inadequate strategic visions, political deadlocks, and having a false or distorted perception of the change at the

initial stages of formulation or implementation may result in employee resistance (Pardo del Val and Martinez Fuentes 2003). Cynicism among employees is also cited as a factor behind employee resistance to change. According to Reichers et al. (1997), cynicism can result from several failed change attempts, leading to loss of faith – with detrimental consequences to future change efforts. Hence, scholars have found that "resistance" can occur at any time during the organizational change process and may have different causes.

Drawing back from the earlier discussion of the typology of change, researchers have also argued that the extent and type of resistance might vary according to the type of change. For instance, resistance might be more dramatic if change is revolutionary or radical, or their resistance might be less pronounced if the change is of low scope and involves making minor adjustments (Pardo del Val and Martinez Fuentes 2003). Other scholars, on the other hand, have theorized that resistance varies according to the type of employee commitment. Becker (1992), a supporter of this notion, points out that employees have three types of commitment to their organizations: compliance (to rules and policies), internalization (values), and identification (social affiliation). Hence, their type of commitment will determine their degree of resistance, if any, to the change imposed.

## Beyond "Resistance" to Organizational Change

An alternative school of thought that critiques and opposes the notion of "resistance" to organizational change presents itself in the literature. Patti (1974), for instance, makes a compelling argument against the use of "resistance" as a concept by arguing that our biased view of the bureaucracy has pushed us to automatically consider bureaucratic institutions as naturally resistant to change and innovation, which may not necessarily be true. Furthermore, she argues that the language of "resistance" tempts managers to perceive of subordinates as "obstacles" to change, thus framing managers' interests as more important than workers' concerns, which may not necessarily be negative.

Piderit (2000) also speaks against the clear dichotomy that the research on "resistance" has created; categorizing employee stances between either determined opposition or firm support. According to him, even negative responses can sometimes have positive motivations, such as concern for the organization's well-being. Therefore, the "resistance" notion bypasses the chance to take such good intentions seriously. Similarly, Krantz (1999) argues that the concept of "resistance" has evolved over years to become a "not-so-disguised" way of blaming employees for failed change attempts, when in fact managers themselves might be the result of such failure.

Another critique of the concept of "resistance" lies in the conflict over its conceptualization. As argued by O'Connell Davidson (1994), "resistance has come to include anything and everything that workers do, which managers do not want them to do, and that workers do not do, that managers want them to do." In essence, some scholars simply believe that the notion of "resistance" has "outlived its purpose." Hence, proponents of this school of thought advocate that researchers need to view responses to change beyond mere "resistance," where responses may not necessarily be consistently positive nor consistently negative. In fact, according to Piderit (2000), when faced with change, employees usually experience feelings of "ambivalence" or mixed and confused emotions, rather than outright resistance or support. In support of this notion, Vince and Broussine (1996) found in their study of public managers' responses to change, that excitement and fear were often experienced simultaneously. Therefore, it is important for researchers to analyze responses along a continuum. In addition, according to Armenakis and Bedeian (1999), responses usually occur on more than one dimension. For instance, affective or cognitive responses may include psychosomatic symptoms such as stress, while behavioral responses may include sabotage and absenteeism. Hence, employee responses have to also be analyzed from a multidimensional perspective.

## Conclusion

As organizations face increasing pressures to adapt to their complex and rapidly changing environments, they are forced to change and innovate to survive. Since employee buy-in and ownership of the change process has been found to be key to ensuring successful implementation of change initiatives, it is paramount to understand what causes resistance to change. This entry, therefore, has discussed the concepts of organizational change and resistance to change as they are conceptualized and debated in the scholarly literature.

Advocacy; Business Planning; Consumer Research; Demographics; Directories; Funding; Franchise Support; Industry Research; Intellectual Property; International Business; Marketing; Mentorship; Professional Development; Tax; Training

## Introduction

The first challenge for many new entrepreneurs is stepping back from their own plans and ideas to place their fledgling enterprise in a wider context. The start-up process is not something anyone can take on alone. Launching a new, innovative idea requires building a network of supporters, reliable research, quality data, and an ability to be responsive to new information. As an entrepreneur moves ahead with their plans, they will find it

necessary to seek new information, return to the research process, and fill gaps in their knowledge.

Starting up is an ongoing process; entrepreneurs may find that the information they need in order to proceed changes as the research process for entrepreneurs is often a moving target. However, all entrepreneurs need to identify their competitors, understand the major and minor factors influencing the outlook for their industry, and learn more about their customer segments in order to be successful.

This entry examines what support and resources are available and where they can be obtained. This listing is categorized by support organizations and free, government, and subscription resources. These resources provide support, guidance, and information at any point in the process and are essential to understanding where a new enterprise fits in with wider industry trends, the local business landscape, and for individual customers. The items listed here should be treated as entry points for further research and exploration.

## Support Organizations

Support organizations provide assistance to help entrepreneurs get their business ideas off the ground. Many provide free in-person or virtual mentoring, access to networking opportunities, and a plethora of business education and planning workshops, videos, and resources. Beyond the opportunity to learn from a local mentor, support organization websites often offer helpful template documents for making financial projections and developing business models and plans. Many of these US and global support organizations partner with agencies in local communities.

Some entrepreneurs will find it helpful to join a professional or trade organization specific to their industry in order to network more effectively, price services collectively, and access research reports developed by experts in their specific field. Consider the benefits of joining professional organizations carefully, as there is generally a charge for doing so.

Entrepreneurs can locate a local support organization or industry professional or trade association with a simple Internet search or via the resources in this entry. The following is a list of organizations:

Association of Procurement Technical Assistance Centers
https://www.aptac-us.org/
Focus Areas: Business planning; mentorship; training
Procurement Technical Assistance Centers form a nationwide network of experts, in over 300 locations, who provide valuable training and counseling services to businesses about the process of selling products and services to government agencies.

Association of Women's Business Centers
https://awbc.org/
Focus Areas: Advocacy; business planning; mentorship; training
The Association of Women's Business Centers advocate to secure economic justice and entrepreneurial opportunities for women. Women entrepreneurs can access training, work with mentors, get help developing their business, and learn about financial opportunities at over 100 Women's Business Centers throughout the United States.

Edward Lowe Foundation
https://edwardlowe.org/digital-library/erc/
Focus Areas: Business planning; mentorship; training
The Edward Lowe Foundation's Entrepreneur's Resource Center is a not-for-profit organization that promotes entrepreneurship by providing information, research, and education.

Ewing Marion Kauffman Foundation
https://www.entrepreneurship.org/
Focus Areas: Business planning; mentorship; training
The Ewing Marion Kauffman Foundation created Entrepreneurship.org as an online resource to help entrepreneurs grow great ideas. The site provides innovative educational tools and informative resources covering the latest issues and insights affecting entrepreneurs.

International Trade Administration
https://www.trade.gov/
Focus Areas: Mentorship; industry research; international business
The International Trade Administration is a government agency that works to improve the global business environment and ensure fair trade and investment. The ITA helps US-based businesses compete both internationally and at home. Entrepreneurs will find information about market conditions, opportunities, regulations, and business customs for over 125 countries prepared by trade and industry experts at US embassies worldwide.

KIVA
https://www.kiva.org/borrow
Focus Area: Funding
Kiva is a nonprofit that expands access to capital for entrepreneurs around the world. KIVA allows small businesses to crowdfund start-up capital and borrows against those funds at 0% interest.

Minority Business Development Agency
https://www.mbda.gov/
Focus Areas: Advocacy; business planning; funding; mentorship; training
The Minority Business Development Agency is an agency that promotes growth and competitiveness of the United States' minority-owned businesses, including African American, Asian American, Hasidic Jew, Hispanic American, Native American, and Pacific Islander businesses.

National Veteran-Owned Business Association
https://navoba.org/
Focus Areas: Advocacy; business planning; mentorship; training
The National Veteran-Owned Business Association certifies and connects veteran businesses with corporate contract opportunities. They provide support through training, advocacy, and networking.

Small Business Development Centers
https://www.sba.gov/sbdc
Focus Areas: Business planning; mentorship; training
Frequently located at colleges and universities throughout the United States, Small Business Development Centers are a resource partner of the US Small Business Administration. They provide consulting services and workshops to help entrepreneurs and small businesses start and grow.

SCORE
https://www.score.org/
Focus Areas: Business planning; mentorship; training
The Service Corps of Retired Executives has partnered with the US Small Business Administration to provide free mentoring services, education, and business planning resources to small businesses. Entrepreneurs can often be matched with a mentor from their industry to receive one-on-one tailored assistance with their business.

State Departments of Commerce, Revenue and Corporations Bureaus
Look up individual state website
Focus Areas: Business planning; directories; mentorship; industry research
Each state has either a department of commerce or revenue, which oversees economic growth and business, or a corporations' bureau that maintains a list of corporations registered in that state. These organizations can provide invaluable information about the current state of the economy, growing state industries, and the steps needed to register and operate a business legally in that state.

United States Chamber of Commerce
https://www.uschamber.com
Focus Areas: Lobbying; mentorship; training
The United States Chamber of Commerce is a professional association and lobbying group that claims to represent companies of all sizes across every sector of the economy in Washington. Chambers of Commerce around the country also offer networking opportunities and education workshops for entrepreneurs. Not all local or specialized Chambers of Commerce are connected to the national

organization. To find convenient locations, search the Internet with consideration toward regional-, neighborhood-, and county-level geographic descriptions.

United States Copyright Office
https://www.copyright.gov/
Focus Area: Intellectual property
The US Copyright Office registers copyright claims, records information about copyright ownership, and provides education information about the copyright protection process to the public.

United States Patent and Trademark Office
https://www.uspto.gov/
Focus Area: Intellectual property
The United States Patent and Trademark Office is a government agency that assists entrepreneurs in understanding and obtaining protections for their intellectual property including patents and trademarks. Entrepreneurs can access the official patent and trademark searching databases, information on pro bono patent attorneys, and educational media about intellectual property.

United States Small Business Administration
https://www.sba.gov/
Focus Areas: Business planning; funding; mentorship; training
The U.S. Small Business Administration is a government agency that provides support to entrepreneurs and small businesses in the form of business loans, business education, and advocacy.

Veterans Business Outreach Centers
https://www.sba.gov/page/veterans-business-outreach-center-vboc-program
Focus Areas: Business planning; mentorship; training
The Veterans Business Outreach Center (VBOC) Program is a component of the US Small Business Administration. Over 20 VBOCs are located throughout the United States for transitioning service members, veterans, National Guard and Reserve members, and military spouses to take advantage of business training, counseling, referrals, and other services.

Y Combinator
https://www.ycombinator.com/
Focus Areas: Business planning; funding; mentorship; training
Y Combinator is a start-up accelerator that provides entrepreneurs with seed funding and mentoring to get their business started. Launched in 2005, Y Combinator has been used to launch over 3,000 companies, including Stripe, Airbnb, Cruise Automation, DoorDash, Coinbase, Instacart, Dropbox, Twitch, and Reddit.

## Free Resources

Access to vetted freely available content can often be a lifesaver for new entrepreneurs. The resources listed here are easily accessible via an Internet search but may require a free or paid account for full access. As with any activity involving money, entrepreneurs should be especially cautious about potential scams or any opportunities for support in which the mission of the organization is unclear or exacts a fee without a clear benefit to participants. Consider assessing the trustworthiness of resources with assistance from librarians and business mentors. The listed freely available resources and platforms have established track records of providing accurate, useful information. Freely available resources might not be vetted for accuracy or up to date, so entrepreneurs should take care to review their content for currency, relevance, authority, accuracy, and purpose.

Angel Capital Association
https://www.angelcapitalassociation.org/
Focus Area: Funding
Angel Capital Association lists angel groups across the nation. Angel investors typically provide money to help small start-up companies take their first steps. Angels can be family, friends, or strangers. Although this association is not a source of capital, it is the official industry alliance of angel investor groups in the United States. This website aligns the needs of angels, entrepreneurs, and the start-up support community.

Bplans
https://www.bplans.com/
Focus Area: Business planning
Find sample business plans from over 500 different types of businesses. Learn how to structure a business, gather resources for market research, and locate financial information.

Crunchbase
https://www.crunchbase.com/
Focus Areas: Directories; industry research
Crunchbase is a global venture capital, angel investment, and private equity database. Entrepreneurs can find information on the financing of start-ups including their industries, investors, and acquirers and get news on emerging industries and technologies. This resource provides limited free data and searching capabilities with the setup of a free account. For full access, entrepreneurs will need a subscription.

Deloitte Industry Outlook
https://www2.deloitte.com/us/en.html
Focus Area: Industry research
Deloitte offers industry prediction reports for state government, banking and securities, commercial real estate, energy and resources, insurance, payments, process and industrial products, renewable energy, retail, and talent strategies industries.

Franchise Direct
https://www.franchisedirect.com/
Focus Area: Franchise support
A useful resource for entrepreneurs considering purchasing a franchise and those seeking broad information about franchising. This site and its research hub provides access to many Franchise Disclosure Documents that may offer helpful background information about start-up and licensing fees. It also allows users to compare the costs of similar franchises before committing.

Global Edge
https://globaledge.msu.edu/
Focus Areas: Demographics; consumer research; industry research
From the Center for International Business Education and Research at Michigan State University, Global Edge contains information on international industries and international consumers. Each country's page also provides trade statistics, rankings of corporations with headquarters in that country, and indices for a range of factors such as Ease of Doing Business and Global Competitiveness.

Google Marketing Platform
https://marketingplatform.google.com/
Focus Area: Marketing
Google's marketing tools, including Google analytics and surveys, will help businesses with websites track website visitors' interaction and activity on the site.

Google Patents
https://patents.google.com/
Focus Area: Intellectual property
Online index of full text of patents, patent applications, and prior art non-patent literature from around the world. Search by patent or application number, date, assignee, keyword, and more.

Google Trends
https://trends.google.com/trends/?geo=US
Focus Area: Industry research
Ideal for mapping local popularity of search terms when the product, service, or need is too niche to be addressed in major industry reports. May also be used to trace the popularity or emergence of a term over time.

Guidestar (Candid)
https://www.guidestar.org/
Focus Area: Directories
Directory of nonprofit organizations that provide mission, program, and financial information. Access key personnel, IRS 990 Forms, and annual reports of nonprofits. Search by geography, cause area, and more. Guidestar Free provides limited data with a free account. Guidestar Pro requires a subscription.

National Venture Capital Association
https://nvca.org/
Focus Area: Funding

The National Venture Capital Association provides a list of member venture capital firms. Venture capital is a form of equity financing in which wealthy investors, investment banks, and other financial institutions provide financing to start-up companies and small businesses that are thought to have high growth potential.

Observatory of Economic Complexity
https://oec.world/
Focus Area: International business
An online resource for international trade data and economic complexity indicators available through interactive visualizations of countries and products.

Pew Research Center Social and Demographic Trends
https://www.pewsocialtrends.org/
Focus Areas: Consumer research; demographics
This project studies behaviors and attitudes of Americans in key realms of their lives, including family, community, health, finance, work, and leisure. The project explores these topics by combining original public opinion survey research with social, economic, and demographic data analysis.

Statistical Abstract of the United States
https://www.census.gov/library/publications/time-series/statistical_abstracts.html
Focus Area: Demographics
First published in 1878, the Statistical Abstract serves as the official federal summary of statistics and provides over 1,400 tables of benchmark measures on the demographic, housing, social, political, and economic condition of the United States. The United States Census Bureau terminated the series in 2011.

Thomas Register
https://www.thomasnet.com/
Focus Area: Directories
Thomas is an online directory of suppliers, manufacturers, and distributors. Entrepreneurs can search for business by product, geographic location, and more. Create a free account to access the full free version of the database.

UnData
https://data.un.org/
Focus Areas: Consumer research; demographics; international business
Search for global data on markets and industries provided by the United Nations.

World Bank Doing Business in Profiles
https://www.doingbusiness.org/
Focus Area: International business
World Bank's Doing Business Indicators country economy profiles measure different aspects of the start-up process including the 11 areas in the life cycle of a business: starting a business, dealing with construction permits, getting electricity, registering property, getting credit, protecting minority investors, paying taxes, trading across borders, enforcing contracts, resolving insolvency, and labor market regulation.

## Government Resources Within the United States

Federal, state, and local governments collect and retain quantities of useful and necessary information for start-ups. While this data can sometimes be difficult to locate or navigate, many offices and agencies have made their freely available information more useful and accessible in recent years. This collection of resources is published by government agencies and made available for free or at minimal cost. While government sources might not be the first place entrepreneurs turn to for information, they will need to develop familiarity with certification, licensing, and registration processes through government sites and may discover additional government resources through that process. Reading citations and references in reports, industry surveys, and trade journal articles can help you navigate government information more effectively. Locate the exact title of the government source cited in a useful, but outdated graphic, and use it to find more recent versions of the same source. The following is a listing of such sites:

American Census Data
https://www.census.gov/
Focus Areas: Consumer research; demographics; industry research
Primary way to access Census Bureau data, including releases from the American Community Survey, Economic Census, Population Census, and more. Use data.census.gov to view, print, and download statistics about population, housing, industry, and business.

American Time Use Survey
https://www.bls.gov/tus/
Focus Areas: Consumer research; demographics
Recent and historic data tracking use of time by age, marital status, and other demographic information. Data can be used for a wide variety of purposes from tracking leisure time trends to identifying who performs household chores and family care. Can be used to confirm a need for services or broader regional interests.

Bureau of Transportation Statistics
https://www.bts.gov/
Focus Areas: Consumer research; demographics; industry research
The Bureau of Transportation Statistics provides a plethora of statistics and insight into how Americans travel each year. Users can also track multimodal freight activity and other transportation economics.

Centers for Disease Control and Prevention
https://www.cdc.gov/
Focus Areas: Consumer research; industry research
As the leading health institute in the United States, the CDC provides information about diseases and conditions. The CDC also collects valuable statistics about disease proliferation and mitigation efforts.

Consumer Expenditure Survey
https://www.bls.gov/cex/
Focus Areas: Consumer research; demographics
This site consists of two surveys that provide information on the buying habits of American consumers, including data on their expenditures, income, and consumer characteristics.

Consumer Price Index
https://www.bls.gov/cpi/
Focus Areas: Consumer research
The CPI measures the average price urban consumers pay for goods and services across the United States and in various regions. Databases, interactive charts, tables, fact sheets, and more report and synthesize the data collected.

County Business Patterns
https://www.census.gov/programs-surveys/cbp/about.html
Focus Areas: Consumer research; demographics
County Business Patterns are annual economic information reports that reflect businesses, their employment, and payroll figures with in-depth geographic coverage. Useful for market analysis.

Industries at a Glance
https://www.bls.gov/bls/industry.htm
Focus Area: Industry research
From the US Bureau of Labor, *Industries at a Glance* reports on over 100 industries, organized by NAICS code or industry name, focusing on employment, labor, and trends.

National Technical Reports Library
https://ntrl.ntis.gov/NTRL/
Focus Area: Industry research
Government agency charged with the collecting and disseminating of scientific and technical reports from government-sponsored research. Technical Reports describe the process, progress, or results of technical or scientific research. Include in-depth experimental details, data, and results.

PubMed Central
https://www.ncbi.nlm.nih.gov/pmc/
Focus Areas: Consumer research; industry research
A free digital archive of biomedical and life sciences journal literature for entrepreneurs pursuing the development of an innovation in medicine or biotechnology.

Small Business and Self-Employed Tax Center (IRS)
https://www.irs.gov/businesses/small-businesses-self-employed
Focus Area: Tax
Few people's eyes light up at the prospect of reading advice from the Internal Revenue Service. In fact, there is always a strong market for accountants and other professionals to take on the work of navigating tax policy and procedures while the primary entrepreneur focuses on other aspects of their business. However, the Small Business and Self-Employed Tax Center offers a no-nonsense overview of business and taxation, and the Industries section provides links to useful statistics and trends in a wide range of industries.

## Subscription Resources

Sometimes the best resources and information are locked behind paywalls. Subscription resources contain high-quality proprietary information that you cannot obtain freely on the Internet. This can include databases of company profiles, unique customer demographics and psychographic data, and established and emerging industry information. These types of resources are only available to those who pay to license the content from a vendor on a yearly or multi-year basis. While individual entrepreneurs may find it useful to purchase access to a subscription resource, many will only need access to individual reports or occasionally check for changes or new information. Libraries can be an invaluable resource for new entrepreneurs as they navigate the research process. Many purchase access to business subscription resources and make them available electronically with a library card or in-person. Touch base with a local public library or a nearby college library for possible access to these types of resources. The following is a list of available subscriptions:

A to Z World Business
https://www.atozworldbusiness.com/
Focus Area: International business
A to Z World Business provides detailed country data on business and trade, current economic climate, statistical rankings, and taxation.

BCC Research
https://www.bccresearch.com/
Focus Areas: Directories; industry research; intellectual property
BCC Research provides reports on major economic, scientific, and technological developments in industrial, pharmaceutical, and high-technology industries worldwide.

Business Plans Handbook
The complete collection is available from Gale eBooks: https://www.gale.com/ebooks
Focus Area: Business planning
The Business Plans Handbook is a multi-volume set of sample business plans from businesses operating in the United States and Canada. Entrepreneurs benefit from seeing how similar businesses approach the planning process.

Business Source Complete
https://www.ebsco.com/products/research-databases/business-source-complete
Focus Area: Industry research
Business Source Complete provides full-text business journals and hundreds of scholarly, peer-reviewed journals covering all aspects of business, marketing, management, economics, finance, accounting, and international business. Find industry reports, business case studies, newspapers, and more.

BizMiner
https://www.bizminer.com/
Focus Area: Industry research
Delivers industry statistics and insights for over 9000 lines of business at local and national levels.

CB Insights
https://www.cbinsights.com/
Focus Areas: Directories; funding
A venture capital, private equity, and other funding streams research database. CB Insights allows track how start-ups are funded,

build a list of potential investors, and research emerging industries.

Conference Board
https://www.conference-board.org/
Focus Area: Industry research
The Conference Board offers in-depth information on a wide range of current business topics ranging from diversity and inclusion to leadership; marketing to public policy; industry-specific information to topics with global reach; and much more.

Cost of Living Index
https://www.coli.org/
Focus Areas: Consumer research; marketing
The Council for Community and Economic Research compiles data that compares the cost of housing, goods, and services between cities. Products include an online calculator, wage comparisons, and geographic indices.

Data-Planet
https://www.data-planet.com/
Focus Areas: Consumer research; demographics; industry research
Repository of datasets from over 550 databases. Products interpret data and are made available to a variety of organizations like libraries, government agencies, and financial institutions.

eMarketer
https://www.emarketer.com/
Focus Areas: Consumer research; industry research; marketing
eMarketer offers data and insights on the digital media consumer market. It focuses on understanding how consumers spend their time and money online and how marketers can best communicate with them via digital channels. Industries covered include automotive, consumer products, financial services, healthcare, telecom, and media and entertainment.

Encyclopedia of Associations
Available from Gale Publishers https://www.gale.com/
Focus Area: Directories
The Encyclopedia of Associations is a directory of over 20,000 America nonprofit professional and trade organizations with a national scope. Divided by subject and geographically, businesses can find organizations that support their work, advance professional standards, and foster development in their industry.

First Research
http://www.firstresearch.com/
Focus Areas: Industry research; international business
A database of industry profiles, statistics, and analysis from over 900 international and national industry segments.

Gartner
https://www.gartner.com/en
Focus Area: Industry research
Provides research and analysis on the global IT industry, includes online research, and reports from 1995 to the present.

Ibisworld
https://www.ibisworld.com/
Focus Area: Industry research
A database of industry reports and data that cover over 700 established and emerging industries. Written by industry analysts, these reports highlight topics such as the competitive landscape, barriers to entry, and major players. Specialized reports are available on-demand.

Key Business Ratios (KBR)
https://mergentkbr.com/
Focus Area: Industry research
Provides competitive benchmarking compiled from data on public and private companies through balance sheets, income statements, and ratios for over 800 lines of business.

LinkedIn Learning
https://www.lynda.com/
Focus Area: Professional development; training
LinkedIn Learning, an online learning website using Lynda.com content, has thousands of video courses in the creative, business, and technology career fields. With many topics

and three skill levels, beginner, intermediate, and advanced, users can find courses to explore new information or review and enhance what they already know.

MarketLine
https://www.marketline.com/
Focus Areas: Industry research; marketing
MarketLine provides market data analytics on consumer products and extensive economic and demographic data on hundreds of countries.

Market Share Reporter
https://www.gale.com/c/business-insights-essentials
Focus Area: Industry research
Identifies the major players and their influence within industries. Useful for entrepreneurs of all types in placing themselves in relation to successes and niche markets that may be overlooked. Useful for identifying potential business to business connections.

Mergent Intellect
https://getmergentintellect.com/
Focus Areas: Consumer research; directories; marketing
Search this database for listings of businesses and people to use for marketing. The international scope can be helpful for identifying potential business partners outside of the United States.

Mintel
https://www.mintel.com/
Focus Area: Consumer research; marketing
Provides thousands of market research reports focusing on consumer products, lifestyles, retailing, and international travel industry. Reports include market size, growth, distribution, competitors, and consumer usage.

Nielsen
https://www.nielsen.com/
Focus Areas: Industry research; marketing
Measures trends in the media industry across all platforms and produces ratings of what audiences view and access.

NetAdvantage
https://www.capitaliq.com
Focus Areas: Industry research
Investors value this resource for its quick access to analysts advice and industry information. Entrepreneurs can benefit from familiarizing themselves with industry surveys and market information. Their profiles of key professionals and companies can assist with identifying players in major industries by region.

PitchBook
https://pitchbook.com/
Focus Areas: Directories; funding
A database of private capital markets, including venture capital, private equity, and merger and acquisition transactions.

Plunkett Reports
https://www.gale.com/c/business-insights-essentials
Focus Area: Industry research
These extensive reports include financial benchmarking and revenue projections for major and emerging industries, such as residential real estate investment, online shopping, airlines, lodging, and publishing on a national scale. Even if an entrepreneur considers their own enterprise to be modest, small, and local, they will find the information useful for connecting their ideas to broader economic trends. Entrepreneurs will also be able to demonstrate familiarity with larger markets to potential funders with access to these reports and projections.

Reference USA
https://www.data-axle.com/what-we-do/reference-solutions/
Focus Areas: Consumer research; directories
Description: A directory of public and private company profiles. Includes residential listings for direct marketing purposes and historic company information. Covers the United States and Canada.

RMA Annual Statement Studies
https://www.rmahq.org/annual-statement-studies/
Focus Area: Industry research

The Risk Management Association provides benchmark data that comes directly from the *financial statements* of small- and medium-sized business clients of *RMA's* member institutions.

Statista
https://www.statista.com/
Focus Areas: Consumer research; industry research
As one of the world's leading databases of statistics, Statista provides market and consumer data across a variety of topics in the form of statistics, dossiers, and infographics as well as a global consumer behavior survey.

Udemy
https://www.udemy.com/
Focus Areas: Professional development; training
Udemy is an online course provider with thousands of video courses, on topics ranging from business, software, and financing to personal development, lifestyle, and health and fitness. Offered in multiple languages, learners of all skill levels can find topics that will increase their business and career opportunities.

US Legal Forms
https://www.uslegalforms.com/
Focus Area: Business planning
This website provides basic legal forms in many categories of business, real estate, and personal matters. Subscriptions include additional features such as an Attorney Directory, Law Digest, Legal Q&A, links to external sites, and federal and state tax forms.

Ward's Business Directory of US Private and Public Companies
Available through Gale Directory Library https://www.gale.com/c/gale-directory-library
Focus Area: Directories
Useful business directory for researchers, analysts, entrepreneurs, and job seekers. Locate information on companies by name, industry, or geographic location. Find data about revenue and activity about competitors and potential customers.

## Conclusion

Without doubt, new entrepreneurs will confront numerous challenges as they endeavor to launch their start-up. The process is not something anyone can take on alone. Support and resources are available to provide guidance and information and to network with other entrepreneurs/businesspeople who are knowledgeable.

## Synonyms

Corporate social responsibility; Grand challenges; Stakeholder engagement; Sustainable development

## Definition

Responsible leadership is a values-based leadership approach that through stakeholder and systems orientation caters for the needs of constituencies directly and indirectly impacted by organizations.

## Introduction

Responsible leadership has become relevant academically during the beginning of the twenty-first century and ever since has been receiving increasing attention. This is due to the enhanced relevance of Corporate Social Responsibility (CSR) and the broader context of sustainable development. Essentially, it is based on the normative premise that organizational leaders as 'citizens of the world' have co-responsibility in addressing the world's most pressing problems such as hunger, poverty, or pandemic threats (Maak and Pless 2009). Rooted in stakeholder theory (Freeman 1984) with a normative core, responsible leadership places organizational leaders within a stakeholder society where they lead based on desirable virtues and principles (Maak and Pless 2006). In this way, they establish meaningful relationships with multiple stakeholders inside or outside the organization regarding economic, social, or ecological aspects associated with their organizations' operations. This expands the traditional leader-follower dyad inherent in classical leadership theories, such as leader-member exchange or transformational leadership, which is why responsible leadership may be considered a contemporary or modern approach to leadership. In addition, what distinguishes responsible leadership from other values-centered leadership theories, such as ethical, servant, or authentic leadership, are its links to the social and ecological components of value creation and change (Pless and Maak 2011).

Responsible leadership is subject to definitional multiplicity. Accordingly, it is often considered "a relational and ethical phenomenon, which occurs in social processes of interaction with those who affect or are affected by leadership and have a stake in the purpose and vision of the leadership relationship" (Maak and Pless 2006, p. 103) and as "the art of building and sustaining social and moral relationships between business leaders and different stakeholders based on recognition, care and accountability" (Pless 2007, p. 450). Responsible leadership has also been referred to as "orientation or mind-set taken by people in executive-level positions toward meeting the needs of a firm's stakeholder(s)" (Waldman et al. 2020, p. 5), while others have emphasized the linkages to "societal and environmental targets and objectives of sustainable value creation and positive change on a global scale" (Miska and Mendenhall 2018, p. 119).

## Why Is Responsible Leadership Important?

Responsible leadership, due to its stakeholder orientation, naturally adopts a business-society perspective. In this way, it is associable with corporate responsibilities as well as with organizations' contributions to sustainable development as embodied in the United Nations' Sustainable Development Goals. In this regard, it can serve as a foundation to elucidate leadership in the context of societal grand challenges (George et al. 2016) spanning both stakeholders inside and outside organizations. Importantly though, responsible leadership is usually values-based, which scholarly is commonly translated into the adoption of a normative or virtue-ethics lens. Stahl and Sully de Luque (2014), for instance, conceptualize responsible leadership behavior in terms of Kantian "doing good" and "avoiding harm" and Patzer et al. (2018) build upon Habermasian foundations while Cameron (2011) equates responsible leadership with virtuousness. Therefore, under a responsible leadership lens business-society relationships with regard to leadership processes and dynamics tend to be considered beyond a purely descriptive point of view, tapping into the ethical and normative core of stakeholder theory.

## Perspectives and State of the Responsible Leadership Field

Perspectives on responsible leadership may be classified according to the scope of the leadership phenomenon as well as to the extent to which individuals address specific stakeholder concerns. As for the first, several authors emphasize the multi-level scope of responsible leadership

spanning micro (individuals), meso (groups and organizations), and macro (society) levels of analysis – in terms of antecedents and outcomes as well as considering cross-level interactions (Miska and Mendenhall 2018). These perspectives accentuate the contextual embeddedness (Stahl and Sully de Luque 2014) of responsible leadership in societal settings. According to Frangieh and Yaacoub (2017), research has tended to emphasize the micro-meso nexus, highlighting personal characteristics and organizational structures, which aligns with Miska and Mendenhall's (2018) perspective that the dynamic cultural and institutional macro-level environments require better understanding.

As for the second, several scholars from the perspective of organizational leaders have analyzed the underlying paradigmatic views inherent in the responsible leadership phenomenon that affect the extent of stakeholder consideration and inclusion. A common theme emerges with regard to instrumental versus integrative (Maak et al. 2016) or economic versus stakeholder perspectives (Waldman et al. 2020) – essentially contrasting traditional shareholder orientation with a broader array of diverse stakeholders. Accordingly, different responsible leadership orientations have been advanced, such as the idealist, integrator, opportunity seeker, and economist types (Pless et al. 2012). These underline the definitional plurality associated with responsible leadership and its shaping by paradigm.

## Studies in the Field of Responsible Leadership

Among the seminal works on responsible leadership is Maak and Pless's (2006) discussion of responsible leadership in the context of stakeholder theory. Based on normative and virtue-ethics foundations, they propose a roles model as *gestalt* describing the different roles responsible leaders assume in leading stakeholders, organizations, and societies. Later works distill the global stakeholder-society context further to outline the requirements on the part of organizational leaders. Ever since, several reviews (Frangieh and Yaacoub 2017; Marques et al. 2018; Miska and Mendenhall 2018) have contributed to demarcating the growing responsible leadership field from other values-oriented approaches toward leadership. In addition, Voegtlin (2011) endeavored the development of a validated scale to measure discursive responsible leadership, and in this way started motivating more empirical research. Quantitative approaches have commonly emphasized the employee and/or follower perspective (e.g., Doh et al. 2011) while works adopting qualitative methodology (e.g., Pless 2007) have progressed motivational drivers, roles, and person-focused responsible leadership antecedents.

Notably, responsible leadership has been conceptually linked to political CSR in terms of both its micro-level foundations (Maak et al. 2016) as well as broader societal developments (Patzer et al. 2018). In addition, while responsible leadership has mainly been conceptualized from a generally Western point of view, several studies set in non-Western contexts such as economies like China, Egypt, Russia, and Turkey have started examining the phenomenon.

## Conclusion

Responsible leadership has emerged as a distinct values-based approach toward leadership that sets organizational leaders within multi-stakeholder contexts. Based on ethical foundations, frequently from a normative point of view, responsible leadership is thus prone to examine questions associated with organizational responsibilities and broader societal sustainable development.

# Responsible Leadership in Public Contexts

Mohamed Mousa[1] and Walid Chaouali[2]
[1]WSB University, Dabrowa Gornicza, Poland
[2]International Institute for Higher Education in Morocco, Rabat, Morocco

## Synonyms

Leadership; Responsibility; Responsible leadership

## Crisp Definitions of the Key Title Words

1. Leadership: the ability to guide others towards achieving specific objectives (Mousa 2019).
2. Responsibility: the ability to act correctly (Mousa and Ayoubi 2019).
3. Responsible leadership: "the art and ability involved in building, cultivating and sustaining trusting relationships with different stakeholders both inside and outside the organization, and in coordinating responsible actions to achieve a meaningful, commonly shared business vision" (Maak 2007, p. 334).

## Introduction

Corruption, corporate scandals, and change in value systems among Western publics have led management thinkers and practitioners to search for a new style of leadership not only to re-develop the missing trust in business practices but also to embed ethics in different organizations (Mousa et al. 2019). Mousa and Ayoubi (2019)

highlight that responsible leadership has become a trend in organization literature nowadays. Maak (2007) has perceived responsible leadership as "the art and ability involved in building, cultivating and sustaining trusting relationships to different stakeholders both inside and outside the organization, and in coordinating responsible actions to achieve a meaningful, commonly shared business vision" (P. 334). Brown and Trevino and Pless and Maak (2011) highlight the need to find leaders who can use their power and resources to act correctly. Consequently, responsible leadership has been introduced as a new style of leadership through which building lasting relationships with stakeholders, embedding ethics within corporate activities, and fulfilling social obligations besides satisfying shareholders by maximizing profits come as realistic mechanisms rather than postponed dreams.

Waldman (2011) highlights that the trade-off between shareholder profits and stakeholder social expectations can be perceived as the main challenge facing responsible leaders. Consequently, meeting stakeholders' needs depends on: (1) the leaders' level of accountability, which reflects the extent to which leaders are willing to accept and then fulfill stakeholder expectations; and (2) the scope of stakeholder engagement, which reflects the extent to which leaders cherish stakeholder participation in the process of decision-making. Mousa et al. (2019) maintain a dearth of empirical studies addressing the association between responsible leadership and work-related behavior exists, particularly in public contexts. Moreover, Mousa and Ayoubi (2019) affirm the scarcity of studies on responsible leadership in non-Western public and private contexts.

Pless and Maak (2011) indicate that the concept of responsible leadership has stemmed from stakeholder theory, which entails that the leader and his organization should consider and address the needs of surrounding stakeholders. In his social learning theory, Bandura (1977, p. 22) states that "from observing others one forms an idea of how new behaviours are performed and on later occasions this coded information serves as a guide for action." According to that theory, responsible leadership is perceived as a role model, a trusted idol who shapes the morals and behaviors of his employees. Bandura (1986) highlights that social learning theory serves as a liaison between behavior and cognition as it entails concentration and motivation. Doh and Quigley (2014) clarify the significance of responsible leadership at the individual level, as the leader perceives his followers (employees) as his main stakeholder and accordingly seeks to stimulate their motivation and subsequently performance. At the meso (organizational) level, responsible leaders initiate long-lasting trusting relationships with *in groups* (employees) and *out groups* (e.g., social actors, government representatives) among the organization's stakeholders. Such engagement of different stakeholders ensures the achievement of societal goals/desires (public education, fighting against poverty) besides organizational ones (profits). At the macro (societal) level, responsible leaders seek to contribute to broader societal goals (e.g., safeguarding human rights, fight against discrimination) and start to show more responsibility towards their environment (decrease carbon emissions) (Stahl et al. 2013).

For Waldman and Galvin (2008) and Pless and Maak (2011), responsible leadership differs from transformational leadership as the responsible leader shifts his focus from only addressing followers (employees) to maintaining long-term relationships with a set of different stakeholders. Meeting social needs is therefore often seen as a priority for any responsible leader. Moreover, if an ethical leader develops an ethical orientation, he and his subordinates should follow this, and the responsible leaders will collaborate with an influx of stakeholders in addressing the socio-ethical agenda they all strive to achieve.

## Responsible Leadership in the Egyptian Public Context

The first study on responsible leadership in Egyptian context was quantitative and the author aimed to find out whether or not responsible leadership mediates the relationship between organizational inclusion and the psychological contract. The study was done by Mousa (2020), who addressed

academics in four Egyptian public universities through questionnaire forms. Upon employing multiple regression analysis to the collected data, the author discovered that responsible leadership positively mediates the relationship between organizational inclusion (which reflects the sense of respect, involvement, and appreciation academics perceive) and the psychological contract (which reflects the emotional and/or nonemotional processes academics perceive due to their schools' fulfillment or breach of their obligations). Mousa (2020) considers this result as logical because the removal of any workplace discrimination, cultural bias, and sense of marginality that ensures the fulfillment of the employer's obligations can be enhanced if the employees feel a set of ethical considerations, stakeholder engagement, and responsible practices from their employer. It is worth highlighting that ethical considerations, stakeholder engagement, and responsible practices represent nothing except the main dimensions of responsible leadership.

The second study on responsible leadership in the Egyptian context was conducted by Mousa et al. (2019). The study was entitled "Climate change, responsible leadership and organizational commitment: The experience of Egypt." In this study, the authors focused on physicians in four public hospitals in Egypt in order to explore whether or not responsible leadership mediates the relationship between climate change and the physicians' organizational commitment. The significance of this research was its focus on climate change, which is currently perceived as one of the most important challenges facing humanity. Climate change includes and is not limited to the increase in global temperatures, rising sea levels, and environmental catastrophes such as hurricanes and storms. Despite the significance of understanding how mitigating the negative consequences of climate change particularly in workplaces and organizational contexts, there is a dearth of empirical studies exploring the organizational outcomes of climate change as indicated by the authors. Even in the Egyptian context, the authors observed an expected shortage in water sources, rising sea levels, growth of carbon emissions in addition to an excessive increase in population. Therefore, tackling the phenomenon of climate change in a country like Egypt is necessary in response to the many negatives and challenging dilemmas both for the government and organizations. Addressing the relationship between climate change and an important organizational phenomenon like organizational commitment, which reflects the tendency of both employer and employee to maintain their work relationships, is a real priority in the Egyptian context. The authors, therefore, through questionnaires and employing a multiple hierarchical regression analysis to the resulting data, identified a negative statistical effect of climate change on organizational commitment among physicians in the Egyptian context.

Responsible leadership does not mediate the relationship between climate change and organizational commitment. Mousa et al. (2019) and Mousa and Puhakka (2019) elaborate that the issue of climate change and its organizational consequences will never be resolved if we depend only on responsible leadership. It needs many other aspects such as public-private partnerships. In order to deal with a threat like climate change, collaboration among international organizations, governments, environmental activists, social actors and responsible leaders should be secured and maintained. This may explain why many corporations and/or organizations have not initiated any systematic effort and/or environmentally friendly policies to mitigate the effects of climate change until the present moment.

The third study on responsible leadership in the Egyptian context was conducted by Mousa and Ayoubi (2019) and addressed academics in three public business schools in an attempt to explore whether or not responsible leadership mediates the relationship between inclusive/exclusive talent management and organizational downsizing. The focus on talent management, which reflects a systematic process of recruiting, hiring, developing, retaining, and deploying talented academics and organizational downsizing, which reflects a strategic scheme to decrease/cut/control organizational costs through decreasing the number of

employees in the addressed organizations, emphasizes the importance of the study. The study was quantitative using questionnaire forms to gather data, which the authors then analyzed statistically. They discovered that responsible leadership has no role in mediating the relationship between inclusive talent management and organizational downsizing, as there is no statistical relationship between the two variables (inclusive talent management and organizational downsizing). Furthermore, responsible leadership also has no role between exclusive talent management and organizational downsizing, as exclusive talent management focuses only on 10–20 per cent of employees (academics in this study) and identifies those that are talented and not others. Accordingly, any responsible practices and/or empathy or engagement from stakeholders does not entail any betterment for those who are classified as nontalented, as their organizations (business schools in this study) might well fire these and end their organizational relationship.

## Conclusion

This chapter starts by elaborating the main motives behind the emergence of responsible leadership as a new style of leadership adopted in different contexts and/or organizations. Upon defining the concept of responsible leadership, the author illustrated the main challenges hindering the implementation of responsible leadership in organizational settings. Subsequently, the author identified the differences between responsible leadership and other styles of leadership (e.g., transformational, ethical) and lastly, paid attention to the three studies conducted to address responsible leadership in Egyptian public contexts. Unlike other countries, the last 3 years have witnessed a considerable focus on addressing the implementation of this new style of leadership in Egyptian public contexts. However, the authors observed that the studies conducted on responsible leadership in Egyptian contexts are all quantitative. Therefore, interested researchers may need to conduct qualitative studies to further explore the main motives and challenges that affect undertaking or implementing responsible leadership there.

# Responsible Public Finance Management

Urszula Kinga Zawadzka-Pak
Department of Public Finance and Financial Law, Faculty of Law, University of Bialystok, Bialystok, Poland

## Synonyms

Accountable public financial management

## Definition

Public resource mobilization and public expenditure management based on public expenditures and revenues balance, effectiveness, efficiency, realism, sincerity, transparency, and democracy (civic participation and democratic procedures).

## Introduction

Public financial management (PFM) is concerned with the aspects of public revenues mobilization and the public expenditure management, even if the revenues side is often neglected. Over the years, scholars of public management have changed their views for responsible PFM, from the classical model, via the new public management (NPM) to the governance model. Thus, the current concept of the responsible PFM has been shaped progressively. Currently, it is considered that it should be based on the public expenditures and revenues balance, the effectiveness, the efficiency, the planning realism, the sincerity, the transparency, and last but not least on the democracy (civic participation and democratic procedures).

## Classical Model, New Public Management, Governance Model

In the classical model, the responsible PFM was used to be considered as an efficient bureaucracy where public policies are faithfully executed by professional, whose main objective was to respect the legal provisions, including the expenditures limits (dominance of the "rule of law"). They should be recruited on the basis of merits and provided sufficient incentives in order to concentrate on their official duties (hegemony of the professional in public service delivery). Additionally, in the classical model, the responsible PFM meant that the budgetary revenues should be balanced by the budgetary expenditures (the balanced budget principle), even if the classical model have not provided the means enabling the avoidance of the intentional deficits. Moreover, the scope and the amount of the planned expenditures of the particular ministries and their subordinated units were based on slight changes comparing to the amounts planned or executed in a previous year (the incremental budgeting) (Weber 1947; Hood 1991). This planning method had not promoted the rational public spending. Thus in the second half of the twentieth century to link the content of the budget spending authorizations with the ministries' and agencies' decisions about the funds' allocation and to enhance their efficiency (rather than public policies effectiveness) several new initiatives were taken, i.e., the planning, programming, budgeting system, PPBS in 1960s or the zero-based budgeting, ZBB (Bovaired and Löffler 2009).

Despite these attempts, there was still a need to meet a problem of the operational inefficiency of public spending. Thus, at the end of 1980s, NPM strongly inspired by private sector practices was started to be implemented in the public administration sector. NPM is often linked to the doctrines

of economic rationalism that assumes that there are very few exceptions to the rule that the market is the best way of deciding what is to be produced and how it is to be produced by public sector (Nevile 1994). Government bureaucracies should now become the strategic business units competing with each other to fulfill in the best possible way the needs of citizens, considered here as the customers of public services. The efficiency and effectiveness of public services should be transparently planned in the performance plans in the form of outputs and outcomes indicators. Then its achievement (or not) should be controlled, benchmarked, and analyzed. Next, in the NPM concept there is a need of the comprehensive and transparent information about the state's financial situation that should be provided under the accrual basis of accounting, what means that the revenues and the expenditures are recorded when the obligations to pay arise. This accrual method, previously used mainly in the private sector, is an alternative to the cash method, previously traditionally used in the public sector, where the revenues and the expenditures are recorded at the moment of the payment.

Recently, it turned out that promoting the efficiency, the effectiveness, or the economy can weaken the equity that should be the highest value. What is more, NPM greatly strengthens the administrative discretion to the detriment of citizens' representatives in a parliament. As a remedy to these problems, the public governance concept was conceived basing on the collaboration as decision-making and service-delivery supporting instrument (Osborne 2010) where not only a government should govern but also other actors as private sector units, NGOs, and citizens, all together creating in this way the multidimensional networks.

## Measures on Public Revenues Strengthening Responsible Public Finance Management

The responsible PFM requires the combination of complementary actions in terms of both the public revenues and the public expenditures.

Concerning the actions on the public revenues, three measures should be taken. Firstly, the responsible PFM requires the realistic public revenues planning based on the reliable macroeconomic prognosis that should be rather pessimistic than optimistic. Otherwise, when the revenues prove lower than it had been expected, the rushed and unreasonable expenditures cuts and/or the increase in deficit are needed. The divergences between planned and executed revenues can be higher by more than 10% (Zawadzka-Pak 2014). The last financial and economic crisis that started in 2007 highlighted the need of the establishment of the bodies independent from government and controlling the quality and the realism of the macroeconomic and the budgetary prognosis. Thus in many countries the fiscal council has been established.

Secondly, for the responsible PFM, the effective tax administration capable to collect all or at least the majority of tax claims is needed. Only when the execution cost is higher than the tax debt it is economically rational to abandon the execution. The inevitableness of taxation shapes the responsible fiscal citizenships that helps to solve the problem of tax avoidance that takes place when the applicable taxes are not payed. It is estimated that scandalous EUR 1 trillion of potential tax revenues is lost to tax fraud, tax evasion, tax optimization, and aggressive tax planning every year in the EU, representing an approximate cost of EUR 2,000 for every European citizen each year (Report 2013). Even if the terminological boundaries are not clear, there are three main types of tax avoidance: tax frauds (illegal fiscal crimes), tax evasion (tax fraud in the legal sense: process aimed at the avoidance of taxes when the binding law would normally lead to the tax payment), and tax optimization/relocation (using the legal means and/or abusing law only for the purpose of avoiding tax payment). To solve these problems there is a need of punitive approach (sanctions) and the preventive one (e.g., preventive fiscal agreements between a tax administration and a debtor) (Raczkowski and Schneider 2013).

Thirdly, responsible PFM in terms of public revenues requires conscious and rational tax expenditures policy. Tax expenditures are reductions in the tax liabilities that result from preferential legal provisions, such as special exclusions and exemptions from taxation, deductions, credits, deferrals, or preferential tax rates (Berman and Rabin 2007). There is a need of the (nonexisting in many countries) information on the total amount of public revenues lost because of the tax expenditures and the legislation limiting the tax expenditures. Often the estimated amount of tax expenditures exceeds the amount of a country's public deficit. Unfortunately this not always transparent part of public spending is out of budget procedure and public control and effectively limits the ability of proper and responsible fiscal policy (Dziemianowicz et al. 2014).

## Measures on Public Expenditures Strengthening Responsible Public Finance Management

Even if the actions concerning the public revenues contribute to the responsible character of PFM, it cannot be fully achieved without the measures on the public expenditures.

Firstly, the responsible PFM should result in fiscal (public finance) sustainability that relates to the ability of a government to assume the financial burden of its debt in the future. Fiscal policy is not sustainable if it implies an excessive accumulation of government debt over time and ever increasing debt service. Limits to sustainability differ across countries and over time (Fiscal 2012). The most effective instrument to achieve the public finances sustainability are the fiscal rules that are the institutional mechanisms that constrain fiscal policy discretion aiming to enhance transparency, accountability, and the effectiveness of fiscal management. There are two sorts of fiscal rules: the procedural fiscal rules that define the attributes and interaction of participants in the budget process and the numerical fiscal rules that limit in amount the expenditures, the public deficit, and the public debt, eventually they guarantee the minimal level of public revenues. Respecting of these rules can help to maintain the public deficit and in consequence the public debt at the sustainable level. Even if the fiscal rules, especially after the last crisis, have become popular, only in few countries they have contributed to balancing the state budget and to considerable public debt reduction.

Secondly, the responsible PFM should aim at the effectiveness (quality of public services and products), the efficiency (ability to avoid wasting public resources), and economy (savings). This principle "3E," strongly promoted by the NPM can be realized by the performance budgeting, defined as the public sector funding mechanisms and processes designed to strengthen the linkage between funding and results (outputs and outcomes), through the systematic use of formal performance information, with the objective of improving the allocative and technical efficiency of public spending (Robinson 2007). Even if the majority of countries have some experiences with the performance budgeting, the least-developed ones as well, the performance information rarely is used satisfactorily and often is not used at all to improve the PFM. The achievement of the aims of "3E" principle requires the reinforcement of the performance budgeting effects by the other often neglected tools of performance management, including the managerial flexibility and the managerial accountability.

There is another instrument that can contribute to "3E" principle, i.e., participatory budgeting that, contrary to the performance budgeting, can be used only at the local level. The responsible PFM should include the responsible allocation of resources through financing actions actually needed by citizens and in consequence should contribute to the progressive improvement of their quality of life. The governance concept assumes that effective public administration requires the citizens' participation in the decision-making process, including the spending decisions. Participatory budgeting is one of the main instruments of citizens' participation at the local level that enables

the citizens to decide about the destination of part of the local budget expenditures. It is originated from Brazil, Porto Alegre city, and spread all over the world. Here, its positive impact is a noticeable improvement in the accessibility and quality of various public welfare amenities in those municipalities that have adopted it. The participation of the Brazilian in the participatory budgeting and the influence of the people belonging to low-income groups in the budget allocation process are proof of their empowerment (Bhatnagar and Rathore). Additionally, if the important part of citizens is involved, the participatory budgeting can strengthen the local democracy, as in the case of Brazilian cities, where it has contributed to reduction of clientelism, nepotism, and even dictatorship.

However, at the local level the necessary precondition of responsible PFM is the sufficient scope of autonomy of local government. There are two main international regulations setting standards of local governments' legal position, comprising standards of local PFM: Worldwide Declaration of Local Self-Government and European Charter of Local Self-Government, both adopted in 1985. Local governments, being the public administration units closest to citizens, are considered to fulfill the best the citizens' needs. However, to achieve it the local authorities need the financial, administrative, and political autonomy. Thus, the responsible PFM should widen the scope of local decentralization. Unfortunately, many central governments unwilling to share with the local government the power to decide have stopped the initialized decentralization process.

One of the most serious threats to the responsible PFM is the corruption. Obviously, even if this problem is more serious in the least-developed countries or developing countries (e.g., it is estimated that the third of the Kenyan budget is lost to corruption), the majority of countries struggle with it. Combating corruption, as having systemic but also ethical grounds, is a complicated problem. However, as the empirical evidences show promoting internal motivation can be effective in deterring corruption, possibly even more than external motivation such as performance pay systems (Kwon 2014). Another possibility is to create anticorruption agencies. One such institution that is often presented as a successful example is the Hong Kong Independent Commission against Corruption (Huberts 2014).

## Control of the Responsible Public Finance Management

Controlling of the politicians' and public servants' actions and enhancing in this way their accountability is an important factor strengthening the responsible character of PFM. With the evolution from the classical model to the governance one, the enlargement of forms of public accountability took place.

Firstly, the traditional legality control of the public spending and the public revenues is the indispensable condition of the responsible PFM that additionally should be based on the Montesquieu's principle of the triple division of power. Thus, at the stage of preparation of Budget Bill, the executive bodies should play a preponderant role, at the stage of the Budget Act voting to the legislative bodies, at the stage of the Budget execution to the Council of Ministers and the subordinated units, at the stage of control of the Budget Act execution to the Courts of Auditors, and finally at the stage of control of the conformity with the Constitution of the Budget Act and other acts related to PFM to the constitutional courts.

Secondly, NPM introduced the effectiveness and efficiency of budget spending execution realized thanks to the objectives and indicators of the performance plans and via the control of its execution and more broadly via the management control. The latter provide accountability in an effort to stimulate decisions-making that result in efficient and effective use of public funds and preparation and use of appropriate reporting systems (Berman and Rabin 2007).

Thirdly, the already mentioned fiscal council should enhance the government fiscal

accountability. Provided that these bodies enjoy professional independence and ensure impartiality and high quality in the production of their reports, they can have important positive influence on the reduction of the public deficit and the public debt level and more broadly on the PFM.

Even if there is no doubt that all these types of controls play important role in the PFM, they are not sufficient to make PFM effectively responsible. As it is considered, these more or less traditional types of controls should be enhanced by the internal control (motivation) of politicians and the public servants. Empirical researches demonstrate that motivation matters for performance because motivated employees are committed to achieving the goals of the organization and put more effort (Rainey and Steinbauer 1999). Thus in the responsible PFM the important attention should be paid to mechanisms motivating to collect and spend public funds efficiently (as NPM wishes) and effectively (as the governance concept postulates).

## Conclusions

The concept of responsible PFM was developed progressively. Its first success conditions were conceptualized in the classical model, even if the effective instruments enabling to fulfill them were unknown, as in the case of the balanced budget principle. Afterwards, NPM has highlighted the strong need of effective, efficient, and economical PMF, proposing some instruments to implement it, e.g., performance budgeting. However, over the time, it turned out that public administration needs additional means to carry out the responsible PFM. In consequence, the governance concept proposes the participation of citizens, the private sector units, and the NGOs to create the networks capable to make PFM more responsible.

The instruments of responsible PFM concern both the public revenues (the realistic macroeconomic and budgetary prognosis, the policy against tax avoidance, the tax expenditure policy) and the public expenditures (the performance budgeting, the participatory budgeting, the decentralization, the fight against corruption). Even if this list is not exhaustive, the analysis of these instruments leads to the conclusion that the general condition of the effectiveness of these instruments is not only its formal implementation but its real incorporation to the public administration practice. To achieve it, the multidimensional accountability system for responsible PFM is needed.

Budget restructuring; Governance; Government reform; Portfolio management; Reorganization

## Definition

Restructuring the National Weather Service's budget, organization, and governance to improve service delivery and achieve the strategic outcome of Building a Weather-Ready Nation.

## Introduction: Current Mission and the Need for Change

The National Weather Service (NWS) is a federal government agency with the mission to provide real-time observations, forecasts, and warnings of weather, water, and short-term climate events to save lives, protect property, and enhance the Nation's economy. The NWS accomplishes its mission through a real-time, end-to-end forecast process, described in Fig. 1.

These functions support 24 h × 365 day forecast operations within a spectrum of 9 National Centers, 13 regional River Forecast Centers (RFCs), 21 Aviation Center Weather Service Units (CWSUs), and 122 Weather Forecast Offices (WFOs) geographically distributed throughout the United States (Fig. 2). The NWS also supports a growing weather, water, and climate industry that provides tailored products and services to a large spectrum of private and public interests from agriculture, energy, and manufacturing to public safety.

The NWS continues to work with the research community as well as with its partners and customers to improve the delivery of the best possible observations, forecasts, and warnings. Furthermore, the NWS has recognized through an expansive strategic planning activity that it must go beyond providing forecasts and warnings and connect this vital information to decision-makers within federal, state, tribal, and local governments to ensure that the information is translated into actions that saves lives. This bold vision has been captured within a strategic outcome of "Building a Weather-Ready Nation" and involves the provision of what has been termed "Impact-Based Decision Support Services" (National Oceanic and Atmospheric Administration 2011) to connect meteorological information to decision-makers to encourage proper action in the face of impending extreme, weather, water, and climate events.

After developing the NWS strategic plan to build a Weather-Ready Nation, the NWS contracted two National Academy reviews of the NWS: a 2012 study by the National Academy of Sciences (NRC 2012) and a 2013 study by the National Academy of Public Administration (NAPA 2013). Both studies validated the Weather-Ready Nation strategic outcome and strongly encouraged NWS to evolve to meet the changing weather, water, and climate needs of the Nation. The NAPA report specifically noted the best place to start in this evolution was to reform NWS's budget structure, Headquarters (HQ) organization, and business processes as essential building blocks to future change, as these had not changed appreciably since the 1990s. The decision to restructure the NWS budget made sense since budgets serve as an effective mechanism to provide the administrative coordination that serves as the basis for the change management envisioned (Brook 2012).

Changes to the HQ organization and associated business processes (governance) made logical sense to align with the restructured budget. Ultimately, the NAS and NAPA reports proved critical in providing the independent, third-party support for the NWS to gain approval on these

**Restructuring the National Weather Service to Build a Weather-Ready Nation, Fig. 1** End-to-end forecast process and value chain at the National Weather Service

**Restructuring the National Weather Service to Build a Weather-Ready Nation, Fig. 2** Map of NWS HQ, regions, National Centers, and field offices

changes from NWS's parent agencies, the National Oceanic and Atmospheric Administration (NOAA), the Department of Commerce (DOC), the Office of Management and Budget (OMB), and Congress. In the last several years, NWS has briefed its progress to NAPA on multiple occasions, and members of NAPA continue to recognize NWS's noteworthy progress and provide support as NWS continues on its journey to build a Weather-Ready Nation.

The effort to restructure the budget, reorganize HQ, and establish a NWS Governance Document (required for a transparent and inclusive budgeting, planning and mission execution process across the entire agency) was initiated in 2013. The results and conclusions from this major undertaking, which was approved by Congress in 2014 and implemented by the NWS in 2015, will be described in this paper, along with the benefits that have already been realized and other reflections concerning the effort. The paper ends with a look forward as we now position the NWS to enhance the services required to address the Nation's growing needs for weather, water, and climate prediction, especially for extreme weather and water events.

## Budget Restructuring

Prior to 2015, the NWS Congressional budget was organized into 25 Program, Project, and Activity (PPA) budget lines across the Operations, Research, and Facilities (ORF) and Procurement, Acquisition, and Construction (PAC) PPAs and was largely categorized by program or operational system (Fig. 3, top panel). These PPAs were difficult to defend and manage, particularly within the Local Warnings and Forecast (LWF) and Central Forecast Guidance (CFG) PPAs, which contain many, but not all, of NWS's forecast operations. Together, these two PPAs constituted 80% of the NWS ORF budget and 72% of the total NWS budget. LWF alone contained an assortment of programs and projects at the local level including funding for labor, rents, utilities, and repairs at NWS's facilities, as well as funding for the National Data Buoy Center and marine observations, other land-based observations, various dissemination, and IT systems in local and regional offices, among other local office expenses.

Since management authority was not aligned with budget authority in the NWS, particularly within these two broad PPAs that constituted a large majority of the NWS budget, the NWS Chief Financial Officer (CFO) was routinely asked to make trade-offs between dissimilar programs and projects when budget shortfalls occurred in the third and fourth quarters of the fiscal year, often with little notice and with little background or insight into the programmatic benefits and risks of those decisions to the NWS mission. For instance, the previous budget structure allowed NWS management to trade off infrastructure for forecast operations, areas that are dissimilar yet both essential to the success of the NWS to accomplish its mission.

Furthermore, the old budget structure contained a number of unique observations and information technology programs that also were represented by separate PPAs, restricting the NWS from being able to efficiently and effectively manage its resources across the suite of observational programs and technologies to deliver the best results for the NWS and the Nation. Perhaps one of the most egregious examples in the old budget structure was three distinct budget lines for the NOAA Weather Radio Program that focused on (1) transmitter upkeep and maintenance; (2) day-to-day operations and maintenance at field sites which predominantly consisted of leases, maintenance services, and telecommunications; and (3) construction, expansion, and upgrades. In this old structure, if resources for leases were expended in one budget line, funds from the other two budget lines could not be used to cover the additional costs without going through the required several-month process to reprogram the funds through Congress and reapportion them through OMB. Overall, this structure did not provide a transparent, logical view of how those decisions mapped into the forecast process noted in Fig. 1 and hindered NWS's ability to effectively select and manage

**Restructuring the National Weather Service to Build a Weather-Ready Nation, Fig. 3** Comparison between the old budget structure (top) and the new budget structure (bottom) for the fiscal year 2014 enacted budget

the best mix of programs and projects within schedule and budget.

This budget structure eventually contributed to a mismanagement of funds and an Antideficiency Act violation in 2012. It was discovered that NWS illegally reprogrammed funds in 2010 and 2011 among the various PPAs without notifying Congress as required by law, thereby incurring obligations in excess of available appropriations. According to an analysis by the Government

Accountability Office, as well as an internal NWS assessment by Grant Thornton LLC, systemic budgetary pressures, improper levying of common service assessments on the LWF and CFG budget lines, and lack of internal controls culminated in the inappropriate and illegal reprogrammings (Blank 2012).

While corrective action was taken on behalf of NOAA and the NWS to improve internal controls and financial management, independent assessments also suggested that the NWS Congressional budget structure should be reevaluated to increase transparency, flexibility, and accountability. The NAPA report stated, "The Panel finds that in reorganizing budget lines and the HQ structure, it should consolidate responsibility around operational functions and service delivery. . .and work towards forecast consistency and sharing of information and policies across regions and offices" (NAPA 2013). The Grant Thornton report suggested several recommendations for improvement, including that NWS should develop standard definitions of budget lines and identify the types of costs that are appropriately charged to budget lines in addition to the programmatic costs (Grant Thornton 2013).

Based on these recommendations, a new NWS leadership team began discussions in 2013 with NOAA, DOC, OMB, and Congress to restructure the NWS budget to be more logical, simpler to understand, and more intuitive to manage. The NWS proposed to restructure the budget into a portfolio-based structure that followed the forecast process described earlier in Fig. 1: Observations, Central Processing (computer infrastructure), Analyze Forecast, and Support, (forecast operations), Dissemination (distribution of information), Facilities (buildings and sites that support the NWS), and Science and Technology Integration (forecast improvement and numerical weather prediction). By organizing the budget along functional portfolio lines, NWS can better identify, plan, and manage the organization's resources.

This new budget structure proposed that the 25 PPAs in the old budget structure be streamlined into 9 PPAs that reflect the individual components of the forecast process and map directly to the 6 portfolios described above. ORF and PAC budget lines were created for the Observations, Central Processing, Dissemination, and Facilities portfolios (Fig. 3, bottom panel). Science and Technology Integration has only an ORF budget line and Facilities has only a PAC budget line. Consolidating the number of PPAs in the budget aligns with best practices, including recommendations made two decades ago by the 1993 National Performance Review on federal government performance (Gore 1993). Budgeting by function also follows best practices. As an example, OMB similarly organizes its federal budget according to functional "categories," regardless of the agency that is responsible (Brook 2012).

This new budget structure provides the NWS with a number of benefits. First, the new structure is more transparent and understandable internally to NWS staff, particularly to those making budgetary decisions, reducing the chance of errors or mismanagement. The new budget structure allows NWS to more easily communicate and defend its budget proposals since the scope and contents of each portfolio are directly correlated to the forecast process that the NWS operates within every day. Furthermore, the new budget structure provides flexibility for trade space analysis within each budget portfolio containing a related set of similarly themed programs, projects, and activities, allowing NWS to more effectively and efficiently resource the suite of programs and technologies that meet the overall requirements of the portfolio. The more logical budget structure also aligns better with the intent of the appropriation process and makes it easier for the administration and Congressional appropriators to plan, appropriate, and track execution of NWS's budgets. Lastly, the budget structure helps drive consistency across the distributed organization of the NWS as all budget categories cut across both HQ and field offices, another recommendation by NAPA. Other government agencies have reported similar benefits from simplifying their budgets. One example is the US Forest Service, which saw an 18% increase in productivity in 2 years due to its experiment with budget simplification (Posner and Rothstein 1994).

In 2014, the NWS tracked obligations against the proposed portfolio budget structure while simultaneously executing against the old budget structure in which the budget was appropriated. This generated a detailed mapping and comparison between the two structures, which in turn helped illustrate the benefits of the new structure to stakeholders and helped prepare NWS's workforce for the upcoming changes. After multiple briefings with NOAA, DOC, OMB, and Congressional constituents illustrating the benefits described above, NWS received approval from Congressional appropriation and authorization committees in 2014. NWS officially began operating in the new budget structure on April 1, 2015.

## Headquarters Reorganization

Before, during, and since the modernization of NWS in the 1990s, the continuous effort to sustain and improve the field office structure has challenged the administrative NWS HQ structure. Many functions, both new and evolving, were often placed within a HQ office jurisdiction due to skill sets of the employees rather than organizationally where the function made sense. Over time, several offices within HQ lost role clarity, and many lost budget authority over areas they were considered responsible for. The restructuring of the NWS budget provided an opportunity to explore changes to the NWS HQ organization that would improve role clarity, return budget authority to the appropriate leaders, and improve accountability and performance. In August 2013, NWS gathered feedback on functional needs, priorities, issues, and gaps to better support NWS field offices in providing observations, forecasts, warnings, and associated services necessary to build a Weather-Ready Nation. The process was inclusive of the NWS's employees' union, the National Weather Service Employees Organization (NWSEO). The feedback was consolidated into 27 major findings or gaps.

In September of 2013, the NWS Budget and Headquarters Restructuring Project was established by NWS leadership, who charged a HQ Transition Team with developing a new HQ organizational structure and associated NWS Governance Document, based on the 27 identified findings and gaps. From the onset of the project, NWS leadership consistently communicated that this effort was not about creating a smaller NWS, but about creating a smarter and more efficient NWS that aligns to the new budget structure and is able to work toward the strategic outcome of Building a Weather-Ready Nation. The team researched government-wide best practices from organizations such as the Government Accountability Office (2012) and The Bridgespan Group (2009) and other international meteorological agencies and organizations across the world including the World Meteorological Organization (WMO), the UK Met Office (UKMO), and the Australian Bureau of Meteorology (BOM), as well as recommendations of past NWS teams.

In December 2013, the HQ Transition Team developed three options for the future NWS HQ organization structure with pros and cons. The first option was status quo, which primarily consisted of clarifying functional responsibilities. A second option was an organizational structure that assigned budget planning responsibility to "portfolio leads" largely outside of the primary HQ structure. A third option was an organizational structure that created six HQ Portfolio Offices directly aligned with the portfolio-based budget structure and responsible for budget planning, budget execution, and management of HQ functions for their respective budget portfolios.

The NWS Director chose the third option. The key factor driving this decision was a clear linkage between the HQ office structure and the new portfolio-based budget structure, described in detail below. Further, this organizational structure was very different than the current structure, which helped signal internally and externally that fundamental change was required to move forward.

The new proposed HQ structure directly aligned budget and management authority in NWS HQ with one-to-one relationships between the six HQ Portfolio Offices and the six budget portfolios described in section "Budget Restructuring" to empower and establish clear lines of accountability for budget planning

through execution (Fig. 4). Each Portfolio Office Director is responsible for end-to-end planning and budget execution across labor and nonlabor portions of the budget. The UKMO is similarly organized along the functional lines of the forecasting process, which served as an example for the NWS.

The reorganization also created the Office of the Chief Operating Officer (OCOO) and the Office of Planning and Programming for Service Delivery (OPPSD). The OCOO overseeing the "operations side" of the organization was created to enhance integration across the mission operations offices and the HQ "Analyze Forecast and Support Office" which supports the field. With the creation of the OCOO, the NWS, for the first time, established one office that manages the requirement process and mission operations of the entire NWS field structure. Key roles of the OCOO are to ensure accurate, effective, and consistent delivery of operational products and services, prioritize operational requirements to meet the mission of the NWS, and enhance integration between field offices and HQ in coordination with the offices under OPPSD.

The OPPSD side of the organization was created to house the primary mission enabling functions of the NWS and to develop solutions to the requirements generated on the operations side of the organization. The main role of the OPPSD office is to connect strategic planning with annual planning, ensure the functional integration across all Portfolio Offices to select the best mix of programs and projects to meet field requirements and achieve NWS strategies, and enable corporate engineering standards across portfolios. This change also removed the programmatic planning function for current and out-year budgets from the Office of the Chief Financial Officer (OCFO), a substantial functional and cultural change for the OCFO which had morphed into an office that made both budget and programmatic decisions for the organization, usually with minimal input from HQ or field programmatic offices, as indicated in section "Budget Restructuring." The new HQ organization is designed to better align roles and responsibilities for programmatic and budget planning with leaders most qualified to develop these plans to meet field requirements, accomplish the mission, and evolve the NWS toward the science-based, service agency envisioned in the NWS strategic plan and the NAS and NAPA Academy reviews.

Additional new offices were created to streamline, add, or increase authority of vital functions. The Office of the Chief of Staff was created to create greater synergy across several corporate staffing functions including Congressional Affairs, Communications, and Equal Opportunity and Diversity Management. The Office of the Chief Learning Officer, reporting directly to the Deputy Assistant Administrator, was created to raise visibility of the importance of education and training for the entire workforce. Previously, this function was buried within a HQ office that could not obtain the support required to provide essential training for the organization, leading to major shortfalls in training and exclusion of training for nonoperational employees. Elevating training decisions ensured that NWS continues to invest in its workforce. The reorganization also created an Enterprise Risk Management and Internal Audit Office, bringing a much needed internal review process to enterprise-level risks and issues and largely modeled after the UKMO, and an Office of Organizational Excellence to focus on long-term strategy, external partnerships, organizational health and culture, and continued maintenance of the NWS Governance Document, described in section "Governance." The reorganization also created the National Water Center, now Office of Water Prediction, reporting to the Office of the Chief Operating Officer to develop and deliver state-of-the-art hydrology prediction and related decision-support services.

The HQ Transition Team spent the spring and summer of 2014 developing roles and responsibilities of each office, division, and branch based on the proposed HQ organizational structure, working extensively with all HQ managers. Over 700 HQ positions had to be mapped from the previous HQ structure to the new structure, along with 34 Senior Executive Service (SES) positions, contracts, and property while redefining NWS organizational coding. The NWS submitted a reprogramming package to notify Congress of

**Restructuring the National Weather Service to Build a Weather-Ready Nation, Fig. 4** NWS organization chart after the reorganization. Blue boxes represent HQ offices after the reorganization. Green boxes represent field offices

the NWS's intent to reorganize, and in the autumn of 2014, Congress acknowledged with no objections to the proposed HQ organization.

In November 2014, the final reorganization package was submitted to NOAA Workforce Management Office (WFMO) for review and eventual implementation. A HQ Implementation Team led by Steven G. Cooper, a senior manager from field operations and acting Southern Region Director at the time, was assembled to coordinate and lead implementation, ensuring all budget and administrative support systems (travel, human resources, etc.) were updated accordingly. Further, the Implementation Team's ability to coordinate across NWS and NOAA were critical to its success. On April 1, 2015, both the budget restructure and the HQ reorganization simultaneously went into effect, less than 2 years after the initial start of the effort. Office Directors accepted responsibility and were expected to assign resources to the functions defined in their respective offices.

## Governance

### Process to Develop the NWS Governance Document

In order to effectively operate within the restructured budget and reorganized HQ, NWS required a governance that defined the business-related roles, responsibilities, authorities, policies, and processes across the entire organization. Defined governance processes are essential to effectively and inclusively develop a resource management strategy, promote checks and balances and scientific decision-making, and improve strategy implementation and overall performance (Xue and Guo 2013). Prior to 2013, no comprehensive governance document existed in the NWS. While some budgeting and decision-making roles, responsibilities, and processes were defined, they were not connected, and individuals were often not held accountable to follow them. The primary senior-level corporate decision-making council at the NWS was the NWS Corporate Board. In 2012, in the wake of the 2012 Antideficiency Act violation, the Administrator of NOAA instructed the NWS Director to examine the membership, roles, and responsibilities of the Corporate Board.

The internal review found that the NWS Corporate Board should be terminated. The Corporate Board was large, with a majority of the NWS Senior Executive Service as members and with no clear process for setting priorities, establishing annual milestones and budget plans, and defining execution strategies, making it a difficult environment to make decisions. The culture of decision-making in the NWS at the time did not allow for decisions to be made at appropriate levels within the organization, resulting in a decision-making bottleneck and preventing NWS senior leadership from focusing on top priorities and issues. Further, the meetings were often a mixture of strategic and tactical issues, hampering its ability to focus on strategic initiatives or an effective change management process.

To fix these issues, the NWS researched best practices and case studies from other agencies. The team learned from the UKMO's robust annual planning process, which was integrated into their strategic and budget planning processes and which was fully transparent and inclusive of all offices within the UKMO. To improve decision-making, the team learned from an effort at the Australian Bureau of Meteorology (BOM) to improve their decision-making process. At one time, the BOM suffered from similar issues as the NWS. The BOM organization structure was insufficient for engendering a sense of authority over priorities and decisions, and they had unwieldy corporate bodies that were ineffective in driving toward agency-wide priorities. To rectify this, BOM created a smaller body at the top of the organization that focused on a few key strategic issues but relied on several substructures that focus on operations and administration. The BOM example illustrated that establishing clear roles and responsibilities and pushing down day-to-day operational and business decisions when appropriate are key to a successful corporate decision-making process. Consider also the case of the US Department of Housing and Urban Development (HUD) under Former Secretary Henry Cisneros. Cisneros removed the regional

office level and sent approximately 1000 employees to work within local offices. As a result, the agency reported greater decision-making and less resistance in implementing ideas (Posner and Rothstein 1994). Similar to these case studies, NWS has found that pushing decision-making to lower levels of the organization empowers the workforce and accelerates the incorporation of new ideas into the agency, improving morale and promoting more effective and efficient operations.

In early 2014, NWS instituted a transitional governance that guided NWS planning, budgeting, and decision-making as the NWS transformed its HQ and budget structure. The transitional governance helped shift the governance culture of the organization by promoting transparency and inclusiveness in planning and budgeting across HQ and field offices.

Beginning in January 2014, the HQ Transition Team, also leading the HQ reorganization, began developing the long-term NWS Governance Document that would go into effect after the reorganization and budget restructure. The team was also supported by a small group of three contractors with experience in business process reengineering and project management. The HQ Transition Team established seven Integrated Working Teams (IWTs) associated with each of the proposed governance chapters, to research best practices and ensure the governance development process incorporated a broad set of perspectives from across the organization. Each team consisted of approximately a dozen middle- to senior-level managers from across NWS HQ and field offices and was led by a member of the HQ Transition Team. Table 1 provides a description of the seven chapters developed by these teams. It is worthwhile to note that while the term "governance" often only includes processes associated with decision-making, the NWS Governance Document includes a larger set of business processes spanning strategic and annual planning, budgeting, execution, decision-making, and risk management.

The draft chapters and a shorter Governance Overview Document were sent to all NWS senior executives and senior-level NWS Office Directors for their review. The HQ Implementation Team received and adjudicated 500+ comments. This review process, while time-consuming, was based on the tenets of transparency and inclusiveness that are manifested within governance itself. As a result, the governance gained broad support and was signed and adopted by all 38 senior leaders in April 2015, concurrent with the budget restructure and HQ reorganization. At this time, it was also decided that the governance would be reviewed on a yearly basis and updated based on lessons learned. Since then, the NWS developed and conducted governance-related communications and training and, a year later, performed a thorough review of NWS Governance v1.0, as intended. The review included feedback from NWS senior executives, managers, and employees and resulted in a NWS Governance v2.0 which was finalized and signed in September of 2016. NWS is currently in the process of developing Governance v3.0. NWS has also begun developing and tracking governance performance metrics to quantitatively evaluate the effectiveness of the governance and has implemented a Governance Improvement Advisory Board of NWS council secretaries to identify and recommend areas of continuous improvement.

## Aspects and Benefits of the NWS Governance Document

The NWS Governance Document addressed many long-standing organizational issues at the NWS. Table 2 describes the improvements made by the NWS Governance Document, the most notable of which include aligning budget authority with management authority in the newly reorganized HQ structure and institutionalizing a transparent and inclusive process for planning, programming, budgeting, and executing NWS's programs and projects rooted in portfolio management and which optimizes the agency's resources.

In the governance, Portfolio Directors with technical expertise are empowered to make most budgetary decisions across the entire multi-year budget cycle and across the matrixed NWS HQ and field structure, driving efficiency, consistency, and progress to deliver weather, water, and climate services to the Nation. Financial controls are

**Restructuring the National Weather Service to Build a Weather-Ready Nation, Table 1** Title and description of each NWS Governance chapter

| Chapter | Description |
|---|---|
| Strategic management | The strategic management governance chapter defines the process by which NWS develops strategic goals, objectives, and priorities and the process by which these strategies connect to and influence NWS programmatic and annual plans and budgets |
| Budget formulation | The budget formulation governance chapter provides direction on planning, preparing, formulating, and submitting the NWS budget to NOAA, DOC, and OMB for eventual inclusion into the President's budget to Congress |
| Portfolio management | The portfolio management governance chapter defines the disciplined and integrated approach to identify and prioritize NWS requirements and allocate resources to select the best mix of executable programs and projects to meet those requirements within the NWS portfolio budget structure |
| Annual planning | The annual planning governance chapter defines the annual process for developing organization-wide budgets, plans, and milestones rooted in portfolio management and driven by long-term strategic goals, objectives, and priorities articulated in corporate planning documents, including NWS strategic plans and the President's budget |
| Budget and program execution and evaluation | The budget and program execution and evaluation governance chapter details how the NWS budget is executed, the roles of OCFO, Portfolio Offices, Execution Offices, and the different types of internal and external budget and program evaluations. The process initiates at the start of the fiscal year with an appropriation and outlines all the steps required to execute budgets, programs, and projects, including quarterly program reviews of all NWS portfolios, crosscutting programs, and field activities |
| Corporate decision-making | The corporate decision-making governance chapter defines the process for making informed decisions on issues and plans that cut across multiple NWS offices, Portfolio Offices, and/or Execution Offices, requiring input from leaders with diverse expertise and perspectives to select the most appropriate course of action. The chapter defines four corporate councils that make these corporate decisions |
| Enterprise risk management | The enterprise risk management (ERM) governance chapter defines a framework by which the NWS identifies, assesses, controls, measures, and monitors various risks and opportunities for achieving the organization's strategic and financial objectives. Enterprise risk management within NWS is distinct from program or project risk analysis and assessment. ERM is a process effected by the NWS's leadership, management, and other personnel and is applied in strategy setting and across the whole agency |

still preserved within the OCFO. Since the federal government requires each agency to submit budget requests to Congress several years in advance, a robust planning process is required. Having a single Portfolio Director with subject matter expertise in charge of the multi-year budget cycle for their portfolio supports effective and efficient planning and management of resources connected across the budget timeline. Further, as all HQ and field offices throughout the NWS receive their budgets from one or more of these portfolios, all offices are effectively matrixed into the portfolio structure during the budget planning process, driving consistency, collaboration, and collective planning.

Portfolio Directors identify investments based on validated field requirements, coordinate across portfolios to include all impacted offices, quantitatively and transparently evaluate investments based on evaluation criteria, approve the investments (some of which may be raised to a corporate decision-making council, as described below), and then prioritize the investments based on other programs and projects, all for the purpose of moving the organization toward its mission, vision, goals, and priorities. This portfolio

**Restructuring the National Weather Service to Build a Weather-Ready Nation, Table 2** Benefits gained after the implementation of the NWS Governance Document

| Before Governance Document | After Governance Document |
|---|---|
| Governance and HQ management structure not optimized or documented | Governance aligns budget authority with management authority in a reorganized HQ and is transparent internally and externally |
| Budget formulation not aligned with annual programmatic planning | The Portfolio Offices, with oversight by OPPSD, manage the entire 3-year budget cycle from budget formulation to budget execution |
| Limited visibility and understanding into strategic management, budget formulation, and annual planning | Entire agency, including the field, directly contributes to strategic management, requirement identification, budget formulation, and annual planning through an annual planning process, annual planning meeting, budget formulation process, and strategic planning meeting |
| Requirements management is not consistently practiced and is not connected with budgetary decision-making | Roles and responsibilities for the requirements process are defined, and the process is directly connected to the portfolio management process |
| Poor communication and relationship across HQ and field | Governance promotes a collaborative team culture and approach across HQ and field to plan and manage the mission critical programs and projects of the NWS and ensures communication, inclusiveness, and transparency in the process |
| Operations offices make their own programmatic decisions, leading to inconsistencies across offices and duplication of effort | Portfolio management process improves resource allocation, drives efficiency and effectiveness, and reduces duplication and inconsistencies across the NWS |
| Corporate decisions often made at HQ with limited visibility into how NWS decisions are reached | Establishment of four corporate decision-making councils with membership across HQ and field leadership ensuring inclusiveness and transparency and protecting against personality-driven management |
| No formalized process for enterprise risk management or performance management | Governance develops an Office of Enterprise Risk Management (ERM), an ERM Council, and ERM Governance chapter and provides a foundation for performance management and evaluation |
| Executing offices are not accountable for executing to agreed-to programmatic plans and budgets | Use of a spend plan agreement between OCFO, Portfolio Offices, and executing offices ensure all offices are accountable based on the agreed-to formulated plan and associated budget. Quarterly program reviews have led to more programs and projects executed on time and within budget |

management process leads to better decision-making based on strategic prioritization and more effective and efficient use of resources.

The governance also defines an out-year budget formulation and planning process for delivering the budget request to Congress and an annual planning process for identifying annual programmatic plans and spend plans associated with NWS's annual appropriations. Both planning processes are transparent and inclusive of both HQ and field offices. In the budget planning and formulation process, Portfolio Directors identify ongoing and new program and project requirements and resource allocations coordinated by OPPSD and then work with OCFO, NOAA, and DOC to develop budget justifications. In the annual planning process, Portfolio Directors identify and prioritize programmatic plans based on validated operational needs and estimated budgets formulated in the previous budget cycle. Both planning processes contain planning meetings defined in governance, approximately 6 months offset from each other, which include all NWS HQ and field senior leadership to ensure the

process is inclusive and transparent. These planning meetings also provide time for unique programs that crosscut multiple portfolios to identify and discuss interdependencies. The crosscuts are built into the governance and budget process and include social science, training, and international activities. As noted above, both planning processes require a set of validated, prioritized requirements to base their resource management decisions. Field offices with OCOO are responsible for collecting, identifying, analyzing, vetting, and prioritizing these requirements based on the strategic priorities of the NWS, and the Portfolio Directors are responsible for developing budget and programmatic plans to address these requirements.

At the conclusion of the annual planning process, the Portfolio Directors, the OCFO, and each HQ and Field Office create a spend plan agreement that defines the milestones and associated budgets that will be executed over the subsequent year. This is an important attribute of the new process as the planning and execution of projects are facilitated by the knowledge that resources cannot be arbitrarily repurposed at the end of the fiscal year, as was occasionally done in the past. Since many of the executing offices are under the chain of command of the OCOO but are provided budgets by the Portfolio Directors under a different chain of command (Fig. 4), these spend plan agreements ensure that the annual plans are executed as intended. Annual programmatic and budget plans are then tracked throughout execution through a quarterly program review, which reviews the plans, budgets, and status over 250 NWS activities and/or projects.

The NWS Governance Document also contains chapters on corporate decision-making and enterprise risk management. Strong decision-making is a key aspect of strong leadership and is a critical component of well-functioning organizations. Corporate decision-making refers to those high-impact decisions that cut across multiple NWS offices and require input from a variety of managers to select the most appropriate course of action. Corporate decision-making councils bring transparency to the decision-making process, unify HQ and field leadership, and ensure opinions from across the organization are heard for key decisions.

There are four corporate decision-making councils in the NWS (Fig. 5). The Executive Council is a small, focused body responsible for making strategic decisions for the agency, with membership consisting of the Director, Deputy Director, COO, OPPSD Director, and CFO. The Mission Delivery Council, chaired by the COO, oversees the requirements process and approves

**Restructuring the National Weather Service to Build a Weather-Ready Nation, Fig. 5** The four NWS Corporate Decision-Making Councils as defined in the NWS Governance Document

operational and service delivery policies to ensure successful and consistent mission operations. The Portfolio Integration Council, chaired by the Director of OPPSD, is focused on cross-portfolio integration to ensure that the budgets and timelines of NWS programs and projects across multiple portfolios and across the 3-year budget cycle are threaded together to achieve mission outcomes. Finally, the Enterprise Risk Council, chaired by the NWS Deputy Director, identifies and monitors enterprise risks and issues and approves mitigation strategies.

## Reasons for Success and Lessons Learned

It took the NWS roughly 2 years to design, receive all approvals, and implement the budget restructure, HQ reorganization, and Governance Document and all within existing human and budgetary resources. The success of these efforts can be traced to a number of key factors:

1. **Strong vision** – NWS advocated for a strong and effective customer-centered strategic outcome, "Building a Weather-Ready Nation," which was embraced by the NWS workforce and became a strategic priority by NWS's parent organizations.
2. **Utilizing a challenge to move forward with the sense of urgency** – One of the key elements of successful change management is to utilize a challenge to create a sense of urgency (Kotter 1996). NWS concurred with the NAPA review recommendation that NWS couldn't continue to operate within the old HQ and budget structure to (1) effectively plan and budget for today's operations and (2) work toward the future NWS vision of a Weather-Ready Nation. Furthermore, there was evidence that NWS employees felt frustrated by the old structure that left many HQ offices disenfranchised in the budget process. As a result, NWS used these recommendations to convince stakeholders and the workforce that NWS needed to change the budget structure and realign HQ support functions immediately to correct previous deficiencies and to transform NWS HQ into a more effective service-oriented organization responsive to NWS's operational needs today and into the future.
3. **Engagement** – The NWS senior management team engaged in regular and timely communications at all levels of the government, including NOAA, DOC, OMB, Congress, the NWS's employees' union, industry partners, and most importantly NWS's managers and employees. This outreach was critical for success.
4. **Involvement** – The budget restructure, HQ reorganization, and governance development effort directly involved nearly 150 employees, leveraging a diversity of expertise from across the organization. This purposeful engagement and the associated culture of collaboration, transparency, and inclusiveness were critical to the successful rapid implementation and adoption of the effort by the workforce.
5. **Complementary activities** – By designing the budget structure, HQ organization, and Governance Document to all build on each other and by ensuring they were enacted simultaneously, it improved understanding of the effort, reduced conflicts between old and new processes, and increased the probability that the changes would take hold.
6. **Heavyweight teams** – Clayton Christensen in the book "The Innovator's Dilemma" describes the use of small, motivated, agile teams attached to senior leadership in situations where the proposed change fits with the organization's values but not with the organization's existing processes (Christensen 2000). The budget restructure, reorganization, and governance activities fit these criteria. NWS empowered a small, agile, heavyweight team of leaders, many of who were in their early to mid-careers and motivated to make significant, lasting change for the NWS that would impact their careers. With top management support, these teams were empowered to leverage input from across the organization to create and implement the changes quickly and effectively.

7. **Understanding level of support** – The team, through continuous engagement, adjusted expectations based on what could and could not be accomplished given the sentiment of NWS's workforce, its employees' union, partners, and stakeholders. For instance, changing working conditions was an element of the reorganization that would have encountered strong opposition from NWS's employees' union, NWSEO. As a result, the NWS did not pursue changes that were negotiable at first, but instead focused on changes within management's rights. It was then easier to negotiate changes in working conditions on a case-by-case basis after the reorganization.
8. **Continual leadership attention and feedback** – Through the heavyweight team structure, NWS leadership provided continual attention, guidance, and unwavering support throughout the entirety of these change efforts, removing roadblocks, making adjustments based on lessons learned, and paving the way to success.

NWS must remain vigilant to ensure that the organization continues to move forward. As with every change management effort, sliding backward is always a risk. Further, change in the federal government is often more difficult than in industry, as change and innovation are often at odds with conservative bureaucratic culture (Cels et al. 2012). Thus, it is even more important for NWS to battle these headwinds with a sustained effort to continually engage with stakeholders and employees, communicate, incorporate feedback, reassess, analyze, and improve.

## Conclusions

From 2013 to 2015, the NWS planned and implemented an ambitious restructuring of its Congressional budget, reorganization of its Headquarters, and development of a new governance to define core business processes, all within existing resources, and completed within a short two year period. These actions were initiated in response to serious budgetary mismanagement issues and multiple National Academy reviews recommending that foundational reform of budgetary and management structures and processes were needed. In 2016, after the effort was completed, the NAPA Panel on Executive Organization and Management commended the NWS for:

- Adopting, tracking, and reporting on the NAPA recommendations provided in the study.
- Rebuilding basic competencies and orienting the NWS toward the outcomes it wants to achieve.
- Relating organizational units and resources to mission success.
- Engaging internal and external stakeholders in support of mutual goals.
- Addressing governance and change management as a shared responsibility of management and employees at all levels, and through the use of a carefully and inclusively developed NWS Governance Document, all NWS senior leaders are aligned in the support of the roles, responsibilities, and processes therein.
- Accomplishing the budget restructure, HQ reorganization, and governance development in roughly 2 years, greatly exceeding expectations.

Elements of the transformation instituted at the NWS are also in the process of being implemented at other line offices in NOAA, and a large component of the US Geological Survey has already used this framework to restructure their organization. In summary, this effort is a successful example of federal government reform that is improving NWS's service delivery to the Nation.

These changes to NWS's budget, organization, and governance have also provided a solid foundation from which to tackle future transformational changes to NWS's operating model that are ultimately needed to achieve the Weather-Ready Nation vision and create an NWS that is second to none. The ultimate goal of the NWS as embodied by its mission statement is not just to provide weather, water, and climate information but to do so "for the protection of life and property and the

enhancement of the Nation's economy" (National Oceanic and Atmospheric Administration 2011). Overall, NWS employees are highly motivated and inspired by NWS's mission, as described in the book "Mission Mystique" (Goodsell 2011), which will help catalyze future change to fully realize this incredibly important mission.

To fully realize its mission, NWS will need to increasingly commit its resources toward understanding and prioritizing the needs of its core governmental partners working in emergency management, water management, disaster management, aviation, and other closely related fields as was recently codified in the Weather Research and Forecasting Innovation Act signed into law in April 2017 (H.R. 353, 2017). NWS accomplishes its mission of protecting life and property in large part through these partners. Addressing partner requirements and needs will, with increasing agility, transparency, and effectiveness, flow through the budget and realigned NWS HQ described in this paper to produce an ever more responsive set of tools, products, and services delivered from the NWS to those partners.

Of course, this won't be easy. Getting there will require a robust requirements process, changing what and how the NWS measures itself and applying change management techniques. Notably, it will also require the NWS culture to become more customer-centric. Yet, by leveraging NWS's new budget, organization, and governance, NWS is poised to evolve its products and services and engage with its partners, customers, and stakeholders to advance the United States' weather, water, and climate enterprise and work together to build a Weather-Ready Nation.

# Results and Output-Based Budgeting

Lauren Ellul
Faculty of Economics, Management and Accountancy, University of Malta, Msida, Malta

## Synonyms

Performance information; Performance targets; Performance-based budgeting; Results-oriented budgeting

## Definition

Results and output-based budgeting (also referred to as performance-based budgeting) is defined as budgeting that links the funds allocated to measurable results.

## Introduction: Towards Results-Oriented Budgeting

Budgeting is a multifunctional tool, aimed at fulfilling a number of simultaneous purposes. Planning, management, and control processes form part of every budgetary system (Schick 1966). Decision-making is also a key process that is facilitated through the utilization of the budgetary tool (Zimmerman 2003). In the context of the public sector, control over public funds and accountability to the citizens are amongst the main functions of budgeting (Wildavsky 1978). The budgeting process assists decision makers within the public administration to allocate limited resources amongst the several competing programs; at the same time, it seeks to control public officials' spending through the determination of a specific amount of funds earmarked for each ministry's and department's planned activities.

"Budgeting always has been conceived as a process for systematically relating the expenditure of funds to the accomplishment of planned objectives" (Schick 1966: 244). In a sense, this statement, made around 50 years ago, emphasized the orientation of budgeting towards the achievement of results, in that it linked projected spending to the attainment of pre-established plans and goals. Yet, the traditional view of budgeting, which has been resilient over a number of years and which is still very popular across a considerable number of countries, focuses mainly on input control and resource allocation, rather than on outputs and deliverables.

Notwithstanding the prevalence of traditional budgeting, the need for budgetary reform has been felt in various countries, triggered by the ever-increasing demand for services from the public in a scenario where government revenue is constrained. In addition, the citizens' expectations of enhanced government accountability and transparency are also setting off budgetary reforms. Yet another factor which might be pushing a number of EU governments to reform their budgetary framework is the requirement to comply with the fiscal deficit and debt targets imposed by the Maastricht criteria for qualification and participation in the Economic and Monetary Union, which criteria necessitate countries to exert tight control on their spending. In this regard, results-oriented budgeting seeks to make governments more effective and efficient, by establishing a link between the achievement of pre-established objectives and the resources/inputs required for such purpose. Results-oriented budgeting shifts the orientation of the budget from an emphasis on inputs, to a focus on performance and outcomes. It seeks to connect public spending to the value generated for the citizens and the benefits created for the country.

Results or output-based budgeting is often referred to as performance budgeting and because of this, these two expressions are henceforth used interchangeably in the text.

The purpose of this entry is to discuss and explain results-oriented budgeting, a budgeting system/process aimed at aligning budget allocation decisions with performance targets and measurable results. The rest of the document is structured as follows: firstly, traditional line-item budgeting is described, highlighting its strengths and limitations; next results-oriented budgeting and its impact on resource allocation in the context of the budget process is explained; this is then followed by a discussion of the objectives of result-oriented budgeting together with the challenges encountered when implementing such a system; finally, an overview of the diverse implementation strategies adopted for performance budgeting is given.

## The Traditional Budget

The content of the traditional budget comes in the form of line-items of expenditure, including, for instance, personnel emoluments and operational and maintenance expenses. This budget system involves the establishment of expenditure ceilings in respect of each line item incorporated in the

budget. Forecast expenditures for the next fiscal year are commonly presented in two budgets, one comprising projected capital expenditure and the second one incorporating government's recurrent activities by expenditure categories. The strengths of the traditional budget lie in its relative simplicity and in the control exercised on public expenditure through the stipulation of spending caps which cannot be exceeded (Shah and Shen 2007).

However, the traditional line-item budget suffers from a number of limitations, including its short-sightedness, whereby focus is placed on changes in expense categories from one year to the next. An incremental approach is adopted, such that ministries and departments expect the same budget allocations of the previous year, adjusted upwards by an appropriate percentage aimed to cover for inflation. The incremental basis does not allow for a review of the performance of government programs and activities, since it assumes that no improvements can be effected on last year's allocations. In view of the lack of performance measurement, the effectiveness of programs undertaken cannot be determined and thus, elements of waste cannot possibly be identified and addressed, since they are ingrained in the system. Furthermore, traditional line-item budgeting is especially problematic where government needs to effect spending cuts in order to promote fiscal consolidation or, for example, to reach the country's fiscal deficit target in order to comply with EU obligations. In these circumstances, expenditure cuts are often carried out across all programs without considering their impact on the performance of such programs, rather than targeting budget allocations covering inefficient or ineffective programs. Across-the-board budget cuts might harm sensitive sectors which might already be functioning under tight funding conditions (Murray and Efendioglu 2011).

## The Concept of Performance Budgeting

The concept of "performance budgeting" has been used as the antithesis of traditional budget procedures and formats (Van Reeth 2002). Attempting to address the shortcomings of traditional systems, results-oriented budgeting entails making budget allocation decisions based on program goals and measured outputs/outcomes. In this regard, public organizations are increasingly incorporating results data in their budgeting practices. Comparing results-oriented budgeting with the traditional approach, the former concentrates on the results attained from the expenditure rather than on the funds spent – on what money can buy rather than on fund availability.

Performance budgeting has been defined as any reform that seeks to incorporate output measures in the budget process (Kong 2005). Joyce (1999: 598) defines performance budgeting as involving "a sophisticated web of relations, from inputs to outputs, to outcomes… the connecting of resources to results for budgeting purposes." Results-oriented budgeting, thus, implies that an increase in resource allocation will lead to a corresponding growth in the deliverables. OECD (2008: 3) has defined performance budgeting as "budgeting that links the funds allocated to measurable results." OECD (2007) has identified three categories of performance budgeting: presentational, performance-informed, and direct (formula-based budgeting). These categories are summarized in Table 1.

In presentational performance budgeting, performance information is included in budget documents as background information for enhancing accountability. Such information does not affect decision-making and does not impact resource allocation. As regards performance-informed

**Results and Output-Based Budgeting, Table 1** Performance budgeting categories

| Type | Linkage between performance information and funding | Main purpose in the budget process |
|---|---|---|
| Presentational | No link | Accountability |
| Performance-informed budgeting | Loose/indirect link | Planning and/or accountability |
| Direct performance budgeting | Tight/direct link | Resource allocation and accountability |

Source: OECD (2007: 21)

budgeting, performance information is utilized in budgetary decision-making, but it does not determine what funds will be allocated to government's programs and activities. Thus, resource allocation is affected by past and future performance only indirectly. Where direct performance budgeting is adopted, the amount of funding allocated is based on results attained in the previous period. Such funding is determined on the basis of a formula containing pre-established performance indicators. This type of performance budgeting is only used in selected sectors, like health and education.

An essential precondition for the operation of results-oriented budgeting involves the development of performance measures, including output and outcome measures (Robinson and Brumby 2005). A performance measure has been defined as a "quantifiable expression of the amount, cost, or result of activities that indicate how much, how well, and at what level, products or services are provided to customers during a given time period" (Office of Financial Management 2011: 1). Performance measurement seeks to assess whether progress has been made in attaining the targets. In the context of the public sector, it sheds light on the effectiveness of a budget program, such that policymakers would be able to establish whether the allocated funds are producing the desired results.

## Objectives and Challenges

Results-oriented budgeting initiatives have had a number of objectives, including improving allocation decisions, boosting fiscal consolidation, and enhancing transparency and accountability.

A results-oriented budget aims to enhance the decision-making process covering the allocation of budget funds, by providing public officials with relevant information on program performance expected to be reached through the funds voted. Renewal of the funding of existing programs in the following year is based on an analysis of the success or otherwise of such programs in attaining the performance targets (Gilmour and Lewis 2006).

Results-oriented budgeting is also linked to macro-level goals, since the level of government spending affects fiscal sustainability (Robinson and Brumby 2005). It is useful for identifying ineffective programs and targeting spending cuts to such programs. If productive efficiency is improved such that elements of waste and ineffective programs are eliminated and public services are delivered at lower overall costs, other things being equal, government expenditure would decrease. This would, in turn, lead to a reduction in the tax burdens of citizens or in the undertaking of new programs and initiatives by government (Robinson and Brumby 2005).

The allocation of funds by programs and the development of performance indicators and measures facilitate the public's understanding of government's success in achieving the outputs and outcomes being pursued (Shah and Shen 2007). Therefore, a results-oriented budget provides the citizens with a tool of accountability and transparency for the results attained by the public administration. Performance measurement assumes fundamental importance in the public sector since the civil service is dealing with public funds and it, thus, owes responsibility and accountability for the delivery of products and services to the citizens.

Results and output information can thus be used to hold public officials and civil servants responsible for the actual performance of their programs and departments. Holding public officials accountable for their performance is important for gaining their commitment and dedication to achieve the pre-established targets. This calls for setting achievable and realistic, albeit, challenging targets. In circumstances where the expected outputs and outcomes are not attained, the reasons for such underperformance must be identified and justifications must be sought before holding any person responsible for the under achievement. Indeed, there could be factors affecting the attainment of performance targets which are beyond the public officials' control. For instance, political interference such as decisions which override the financial estimates, or expenditure cuts effected by the central agency during the year for fiscal deficit reduction

purposes, might negatively affect the achievement of certain pre-established targets. Thus, outcome information should be principally targeted at bettering future allocation decisions and performance, rather than to penalize civil servants for past underperformance.

Nevertheless, if it is established that the public official is responsible for the achieved performance, the person involved has to be rewarded or sanctioned accordingly. This necessitates setting up a system of rewards and sanctions for rewarding public officials who achieve the targets and punishing civil servants who perform inadequately (OECD 2007). There are a number of options for reward and sanction mechanisms that could be applied, including, amongst others, linking the performance bonuses awarded and/or the career progression prospects of public officials to the attainment of pre-determined goals; allocating to the department that has achieved its targets, a higher budget in the subsequent year; and allowing a department/ministry who performed satisfactorily to carry forward unspent funds for use in the following year. In order to avoid as much as possible dubious individual behavior, such as greedy behavior or attempts at data manipulation, it might be advisable to set rewards and sanctions at an entity level, rather than at a personal level (Burgess and Ratto 2003).

Notwithstanding the various merits of results-oriented and output-based budgeting, there are several challenges to the implementation of such a system. One issue which arises is how to utilize outcome information for the purpose of allocating resources (Aristigueta and Justice 2006). If the target was not attained, should the program be stopped because it is wasting public money or should the allocated budget be increased because the ineffectiveness is a result of underfunding? Alternatively, if the performance information shows that an activity is effective, should government allocate more funds to produce more outputs and outcomes or should it reduce the program's budget on the grounds that it will still generate the desired results?

Another challenge relates to the fact that though performance information is used to support decisions on setting government expenditure priorities, it has had minor impact on the actual budget allocations (Willoughby and Melkers 2000).

In addition, the introduction of budgetary reforms will, in many cases, be replacing a deeply embedded line-item (traditional) budgeting system, which would have served the country for many years. Jepperson (1991) and Burns and Scapens (2000) advise that changes to an embedded system or to existing "routines and institutions" might encounter resistance to change from the people involved. Results-oriented budgeting initiatives, with their emphasis on outputs and outcomes rather than on spending, might seem to be conflicting with a deeply established culture where public officials are not used to performance measurement. This system is supposed to result in heightened control over spending by public officials and naturally people do not like to be controlled. There is the risk that performance measurement is perceived by civil servants and politicians as threatening their position, since it highlights weaknesses in performance, for which responsibility has to be assumed. Overcoming this challenge requires a culture change, which is both time consuming and expensive (Murray and Efendioglu 2011). But, on the other hand, if the reform has strong political commitment and it is championed by persons who are in a high position of power, resistance to change will be mitigated and the change in people's mindset will be facilitated.

Another problem that arises in the implementation of new budgeting systems within the public administration is the lack of adequate human and financial resources (Kong 2005). A shortage of suitably qualified civil servants might act as a stumbling block for the implementation of a results-oriented budgeting system, since the development of performance information for inclusion in budget documents and the subsequent monitoring of actual performance vis-à-vis the pre-established targets require substantial human resource effort. Unless the remuneration packages and the career development prospects offered by government compare well to those obtainable in the private sector, augmenting the staff complement in the public sector might prove quite

challenging. A further requirement for launching a budget reform is the investment needed in an accounting and information system, to cater for the generation of the required reports.

A results-oriented budgeting system could also be hindered by political influences, including, for instance, government's reluctance to reduce its staff complement or to shift people between departments with the purpose of enhancing effectiveness, since these actions might result in the loss of political points for the governing party. There is also the risk that government's effectiveness would be questioned, in circumstances where the actual performance is short of the pre-determined targets.

## Implementation Strategy

Though results-oriented budgeting systems are widely used, considerable variation in their application exists amongst countries. There is certainly no "best practice" in the implementation of performance budgeting; countries have to design and adapt the budgetary reform to their capacities, cultures, and priorities. This statement is substantiated by the fact that countries have introduced performance information into their budgetary system by embracing diverse implementation strategies (OECD 2007).

One of the issues that has to be taken into account is whether a country should enact the budgetary reform in law or through policy guidelines. The implementation of results-oriented budgeting approaches, particularly of performance budgeting, has followed diverse routes in different countries, with some introducing the reform through legislation, others adopting a system whereby the central government agency releases policy guidelines, while other countries have a mixture of guidelines and law (OECD 2007). Enacting the reform in law might ensure permanence if there is a change in government (OECD 2007). Furthermore, though the introduction of the reform through legislation does not guarantee its successful implementation, the potential consequences of breaking a law might secure the commitment of the civil service and the politicians towards the reform and might result in less monitoring being required, than would be the case if performance budgeting would be implemented by means of policy guidelines.

Another consideration that a country has to make is whether to follow a top-down or a bottom-up implementation approach for launching a results-oriented budgeting system. In a top-down perspective, the central agency (represented by the Ministry for Finance, the Office of the Prime Minister or the Cabinet) plays a main role in the development, operation, and monitoring of the reform; conversely, in the bottom-up view, the departments come up with their own methods and there is less enforcement from the central agency (OECD 2007). Where the envisaged change from the current budgeting system is incremental, the goal conflict is low and there is stability in the environment, a top-down approach is advisable (Berman 1980). A top-down or centralized approach might serve to exert more pressure for change. Furthermore, it provides for consistency in the presentation of performance information across ministries and departments, ensuring meaningful comparisons (OECD 2007). On the other hand, a bottom-up approach involves a greater level of participation by departments in the preparation of the budget figures and in the development of performance and outcome targets and measures complementing such figures. This augmented involvement would potentially result in the departments assuming ownership and responsibility for achieving the pre-determined performance targets. It will also mitigate the resistance to the budgetary reform that might be possibly put up by the civil service. The bottom-up perspective promotes the birth of ideas and programs from public officials with experience on the ground, in view of their frequent contact with the citizens and their needs. This approach is criticized on the basis that civil servants were not democratically elected and policy and program design should, thus, not be in their hands. Berman (1980) recommends the adoption of a bottom-up approach where the upcoming policy changes are significant, the environment is unstable and there is goal conflict. If a bottom-up view is embraced by the

reform implementers, the central agency would still play a fundamental role; firstly, in ensuring that government's strategies and priorities are being addressed through the budget plans and that this is being done within the established expenditure ceiling and secondly, to ensure that the performance targets developed are reasonable and properly benchmarked against international indicators. The central agency will also issue budget guidelines and will be involved in monitoring the actual performance of the departments, vis-à-vis the performance targets that they would have developed themselves.

A further issue to consider is the timeframe required for the implementation of a results-oriented budgeting system. A long-enough period should be dedicated to ensure successful implementation, due to the considerable effort involved to establish a new budgetary system, including, amongst others, the system design, identification, and investment in a new accounting and IT system; recruitment of the required staff complement; and delivery of staff training. Nevertheless, an excessively long implementation period would be counterproductive, since complacency would set in, people's morale and motivation would suffer and there is a higher risk that the ministries' portfolio would undergo changes thus rendering the project more complex.

Successful implementation necessitates strong leadership, which is fundamental for providing a clear vision for the new budgeting system and for bringing on board all key stakeholders during the planning and implementation stages (Kong 2005). Also, an effective project team supporting the leadership is important for driving the reform and keeping the momentum, in order to avoid the loss of interest during the necessarily long implementation process.

## Conclusion

Notwithstanding the move towards output and outcome budgeting observed in a number of countries where performance budgeting was implemented, Sterck and Scheers (2006) found that performance information is not extensively used in final allocation decisions. This finding was confirmed by the OECD 2011/2012 Performance Budgeting Survey, carried out amongst thirty-two countries, which revealed an indirect/loose link between performance information and funding decisions (von Trapp 2014). The latter study indicated that the budget allocation process remains a political tool, with performance information being utilized for accountability purposes, rather than for resource allocation decisions. There were cases where performance information was not being used at all. The study also found that performance targets are mainly being established by line ministries and agencies. These findings indicate that the majority of the countries which have adopted performance budgeting have opted for performance-informed budgeting, where the performance data provides information for informing the budgetary decision-making process, but it does not determine the budget allocations.

Accountability and transparency are important objectives that a results-oriented budgeting system seeks to address. The use of performance measurement in the budgeting process is also aimed at improving government effectiveness and efficiency, while at the same time exercising tighter control on the spending of public money. In particular, performance information plays a key role in guiding resource allocation decisions in countries which are seeking to embark on austerity measures in order to ensure sustainable public finances. Rather than relying on spending cuts across all government programs for the purpose of satisfying fiscal deficit and debt reduction objectives, performance information facilitates the identification of ineffective programs and activities, such that the public administration would be in a position to target the most appropriate sectors for cutting expenditure.

## Synonyms

Performance governance; Performance management; Responsibility

## Introduction

This text aims to develop a state of the art comprehension about performance and performance governance and present two meaningful performance management experiences in Brazilian state governments.

To start with a robust conceptual elaboration is essential because performance management is a term subjected to broad conceptual and

R

semantic confusion. It may mean anything done (e.g., the use of tools such as project management, strategic planning) to get results achieved or it may require specific conditions and requisites to be so called. Nor is performance management the accomplishment of a set of rules, procedures, rituals, and ceremonies regarding government planning and monitoring and evaluation systems – which are pretty diverse in line with bureaucratic traditions in Latin America and Brazil in particular. The Brazilian Constitution, for example, imposes governmental planning, but it has hardly been part of effective performance management. Although some states have strategic plans and some sectoral planning at federal level, most of the planning lack organizational alignment; most of the monitoring and evaluation systems lack good appropriation and many well-intentioned tools (such as project management) end up as bureaucratic burden.

The conceptual treatment under way departs from a comprehensive concept of performance do disembark on multidimensional performance management models. Then a couple of experiences are briefly presented.

## Performance, an Expanding Concept

Performance is not only a multifaceted concept, it is an expanding one. The concept has expanded from efforts towards results and public value (Andrews et al. 2010; Boyne 2010; Brewer 2006; Kelly and Swindell 2002; Van Dooren et al. 2010; Dubnick 2005). Each of these dimensions reveals key aspects, as shown in Fig. 1, reminding a "performance kaleidoscope" (Walker et al. 2010, p. 271) around a performance chain.

There are three important subdimensions to the efforts: execution, excellence, and economicity. Execution refers to doing, performing steps, tasks, activities, actions. It includes projects, processes, and action plans. Excellence means doing things in a qualified way, following good management practices, based on quality standards. Economicity refers to advantageous procurement of inputs (buying well) and rational allocation of resources in activities (nonwaste).

Results are related to efficiency, efficacy, and, mostly, effectiveness. Effectiveness (outcomes) is the desired impact on the context/system in which the action takes place. It refers to the desired

**Results-Based Management, Brazil, Fig. 1** Performance chain and its multiple dimensions. (Source: Author)

impacts, not unwanted effects or negative externalities. It includes intermediate and final impacts and may represent a chain of impacts. Efficacy (output) means to generate a product (good or service, tangible or otherwise) and deliver it to a recipient. Efficacy involves quantity, quality (meeting specifications), and coverage of what is delivered to the recipients. Efficiency is an input-output ratio. To be efficient is to generate more products (outputs) with less inputs. It refers to the productivity of the factors, whether financial, human, material, logistical resources.

Public value is a term that has been the object of much debate since Mark Moore's "Creating Public Value" (1995). He referred to a number of aspects of public sector actions, but mainly return to citizens of taxes paid (in terms of satisfaction with public services and policies), the extent to which the public sector generates value from the resources it collects – in a manner analogous to the private sector, where generated value is returned to shareholders as dividends. But he also referred to public value as (Moore and Benington 2011): value attributed by recipients to what they receive from the public sector; civic and republican values; perceptions of satisfaction and quality (what the public values and consequently would give something in return for); value added through innovation processes; asset, intangible property represented by public institutions; and results of public policies formulated according to refined preferences.

Subsequently, the meaning of the term has orbited around four dimensions (Osborne 2018):

- Satisfaction: the extent to which results (primarily effectiveness) align with visions, expectations, demands, and interests (ranging from the general public's interest to the interest of groups) (Meynhardt et al. 2017)
- Trust: the extent to which the institutions that generate the results are considered capable of generating them sustainably (Kelly et al. 2002).
- Resilience and social capacities: the extent to which a given action promotes increased capacity of society/community to withstand and overcome moments of crisis (Bressers 2017)
- Social values: the extent to which a particular action promotes/aligns with civic, republican, and humanitarian values.

Expanding the concept of performance makes it more complex to manage.

## Performance Management

A significant portion of the literature on performance management mostly addresses measurement, which, broadly speaking, is the process of generating objective and quantified information on performance and incorporating this information into the decision-making process of the action whose performance is measured (Talbot 2010). There is a clear assumption that the overall management process is well established and strategically positioned so that systematic and rigorous measurement will make all the difference. The argument developed here is that performance governance is precisely the integration between a results-oriented management cycle and a measurement system.

According to Van Dooren et al. (2010), "performance management is a type of management that incorporates and uses performance information for decision making. . . . incorporation is about integrating performance information into policy and management cycles of, among others, policy-making, budgeting and contract management" (pp. 30–31).

This definition reveals at least two layers: management of an action (policy and management cycles) and generation and incorporation of information on the action's performance. The first layer is similar to the strategic management process, which implies managing the drivers of performance in a results-oriented way, which means managing "the causal relationship between drivers and achievable results" (Talbot 2010, p. 215). Concepts of management cycles are quite archetypical and are present, for example,

in the plan, do, check, and act stages of the PDCA (Shewhart 1986); in the explanatory, normative-prescriptive, strategic, and tactical-operational stages of Matus (2002); in the goals, development, implementation, and review phases of Ansof (1979); and in the strategic change cycle of Bryson (2011).

The second layer refers to measurement cycle, involving generation of indicators, target setting, data collection, analysis, interpretation, and dissemination of results. Based on this distinction, Fig. 2 illustrates the two layers referred to, in addition to layers 3 and 4. Layer 3 refers to the alignment cycle, by means of strategy cascading, performance agreement, and engagement. Layer 4 refers to the learning cycle. Most multi-dimensional performance management models (Talbot 2010) aim at integrating these cycles.

**Results-Based Management, Brazil, Fig. 2** Performance management as strategic management and measurement, alignment, and learning cycles. (Source: Author)

## Performance Management Regimes and Models

There are different ways of implementing performance management, through different regimes (contractual, capacity building, competitive, and voice and choice) (Talbot 2010).

There is a tendency to expand the scope and depth of multidimensional results-based governance regimes and models – with multiple learning, targeting and control, and accountability purposes (Van Dooren et al. 2010).

Greater scope means building a model that somehow manages the full spectrum of the performance chain: skills, inputs, activities, outputs, impacts, value. Greater depth means to act in an integrated way at different levels: society/citizens; governments (including multilevel); policy domains; networks; organizations; units; teams; individuals. In this context of complexity, the focus is more on what and how to treat each dimension, rather than focusing on only one (e.g., managing only efforts). With regards to levels, a deep multilevel performance management model that addresses individuals to government as a whole, it is crucial not to lose connections and integrations with levels above and below.

Table 1 develops a kind of maturity matrix of results-based governance, drawing on an original matrix by Van Dooren et al. (2010).

## Limits of Performance Management

The key question is what works in multidimensional performance management experiments and models, what are the limitations, and how can they be mitigated. There are four main categories of results-based governance limitations, related to the peculiarities of the public domain, measurement and target setting, use and ownership of performance information, and implementation issues.

The borders of the public domain are broad, tenuous, and shifting in the meanderings of multi- and pluri-institutional governance networks. There are multiple "principals" sectoral authorities, center of government, parliament, audit organizations. Multiple goals prevail: political, technical, symbolic – such as demonstration effect, or appearance of performance management practices without any behavior change and with decisions taken on the basis of poor quality information (Van Dooren et al. 2010).

Measurement and target setting are affected by the many technical and methodological limitations of the indicators, including measurement effects and "diseases," the difficulties and limitations of value metrics, and the myopia effect, whereby the long-term view is excluded by overfixation on the short-term view (Bouckaert and Balk 2011). There is also gaming, such as the underestimation of targets; focus on the nearness of the target, on the most achievable targets, to the loss of others; manipulation of measures/indicators (inflate, deflate, artificially pollute; aggregation and disaggregation to conceal/reveal something) (Bouckaert and Balk 2011); and manipulation of the action, focusing only on the areas measured, to the loss of others, and neglecting what is not measured (Bevan and Hood 2006). There may also be situations in which pressure for outputs generates distortions in the selection of inputs; and complacency, with predominance of adequate performance rather than excellence (Behn and Kant 1999; Grizzle and Pettijohn 2002; Van Dooren et al. 2010).

The use and ownership of performance information are also limited. The lack of visibility stems from the usual political inattention and little engagement by society. On the other hand, rigid and excessive measurement systems lead to paralysis (Mayne 2007; Bouckaert and Balk 2011; Smith 1995).

Among the limitations related to implementation, power games stand out, often generating disputes over autonomy and the fragmentation of implementation responsibility (Trivedi 2018).

These limitations can and must, in a variety of ways, be addressed in the construction of a performance management model.

**Results-Based Management, Brazil, Table 1** Evolution line of results-based governance. (Based on Van Dooren et al. (2010), with adaptations and additions)

| | Traditional preperformance | Administration of performance | Management of performances | Performance management | Performance governance |
|---|---|---|---|---|---|
| Performance setting | Undefined | Formally defined but focused on procedures and compliance | Multiple definitions of different areas of public policy and/or managerial functions (HR, finance, procurement, etc.) | Central, sector, and unit agendas | Central, sector, and unit agendas across government and society |
| Measurement | Intuitive; subjective | Bureaucratic record of administrative data (as administrative activity); goal; predominantly inputs and processes (activities) | Specialized systems (sectoral/ functional) for performance measurement | Cross-cutting performance measurement systems under a single command | Comprehensive and consolidated system of performance measurement |
| Incorporation | None | Some | Within different areas for specific functions | Internal systemic integration | Internal and external systemic integration |
| Use | None | Limited: reports; internal; without lessons learned | Disconnected (not cross-cutting) | Coherent; comprehensive; consistent | Comprehensive internal use and social use |
| Limitations | Functional inattention | Ad hoc; selective; rules-based | Inconsistencies between areas | Complex, perhaps unsustainable as a stable system | Uncontrollable; unmanageable |
| Focus | Focus on inputs and compliance of procedures | Focus on inputs and compliance of procedures | Multiple foci | Outputs and outcomes | Outputs, outcomes and value |
| Information and data | Not available | Of a technical nature, disconnected from performance improvement strategies | Of various natures, might be connected to improvement strategies | Internally structured and shared | Internally and externally structured and shared |
| Management guidance | Performance is not on the agenda | Control; expectation of a commitment to performance | Peculiar views of performance commitments | Coherent performance improvement strategies | Coherent performance improvement strategies |

## Landmark Results-Based Management Experiences in Brazil

In Brazil, the state modernization process has generally been led by the central government. However, since the last decade, states and municipalities have played more active roles motivated by the fiscal crisis and enterprising governments. The two main cases of results-based management recently implemented in Brazil are from the states of Minas Gerais (Management Shock) and Pernambuco (All for Pernambuco).

**Results-Based Management, Brazil, Table 2** Path of the management shock in Minas Gerais (Based on Vilhena, Martins, and Marini, 2016, with adaptations and additions)

The Management Shock in Minas Gerais[1] was the most comprehensive performance management model ever developed in Brazil. Its scope is due to the fact that it has managed to design an integrated development strategy; implemented through multiyear plans, results, and government projects, including actions to reduce expenditure and improve management; with systematic M&E; consequences in terms of variable remuneration, career progression, selection, and dismissal of managers; certification and skills development. Table 2 shows the main elements of the Management Shock's three generations[2].

Implemented and in operation since March 2008, the All for Pernambuco Model, through qualified debate with society, selected and intensively disseminated a set of goals to be pursued throughout the management, synergistically guiding the action of the entire Government. It also routinized, in the public apparatus, a set of tasks and procedures for each of the stages of the policy management cycle, routines that are executed and

[1] For more detail see Vilhena, Martins, and Marini (2016).

[2] For more details see Alessandro, Shostak and Lafuente (2014).

simultaneously monitored by the Government. This set of tasks is systematically monitored and evaluated, involving a large set of managers and civil servants.

The All for Pernambuco model' monitoring system consists of regular meetings chaired by the Governor; physical and financial monitoring of the Priority Projects – Decision-making meetings; and focus on addressing bottlenecks. The complete cycle lasts 5 weeks. The Secretariat of Planning (SEPLAG) teams act as "Concept Guardians" – facilitators of the process. Execution is monitored online (Control Panel) and key projects monitored by PMO, complying with PMI methodology (PMI 2018).

The results achieved were bold: close to 40% reduction in the homicide rate since the start of the Pact for Life (60% reduction in Recife); close to halving of the child mortality rate in 5 years – from 30.1 deaths per 100 thousand live births in 2006 to 15.66 in 2011; meaningful illiteracy reduction on Pernambuco's municipalities.

Both cases reveal multidimensional performance management models to which many government planning and evaluation systems have been integrated. The reference experiences are examples of performance governance and, despite their limitations and reorienting (typical case of the management shock, which was discontinued in the last state government), inspire many others that have not yet reached this condition. But despite being exceptions, they act as proofs of concept and as proof of what can happen when certain conditions are met – qualified public servants, sense-making, and combined political and executive leadership.

## The Future of Performance Governance in Brazil

Van Dooren et al. (2010) argue that the future of results-based governance will require greater agility to deal with complexity; greater closeness to the action; insertion in the political dimension; strengthening of the evidence base, facts, structuring of the political debate (who gets what, when and how); engagement of more actors; expansion of learning based on multiple analytical perspectives; coping with controversy and ambiguity; and a careful argumentation of causes, consequences, and priorities.

It is critical that those who implement results-based governance realize the conditions and constraints that surround any results-based governance experience and seek to mitigate them in the design phase of the models. This includes taking into account that:

- Results-based governance should seek to introduce a performance culture and transform the organizational arrangements involved
- Technological instruments and artifacts are no more important than the model, the logical design of the management, and the measurement process
- The regulation of results-based governance must not stifle the model, rather, it is necessary to establish a mix of incentives and inducements based on engagement, closeness, and ownership
- Society's engagement is vital to increase demand for performance information, allowing better understanding of the usefulness of the information generated in improving policies and services

It is also essential to broaden and intensify research on the theme of results-based governance, based on mapping and better conceptual and methodological systematization; adoption of mixed methods (quantitative and qualitative in an integrated way), new methods (hierarchical modeling and experimental methods) (Hicklin 2010); construction of new and large databases for the generation of performance algorithms through neural networks and other advanced analytical data science tools (deep learning and machine learning); and integration with intervention processes through the use of participatory and transformational methods, mainly for the generation of applied results-based governance instruments and tools.

# Rethinking Public Administration Paradigms: Toward a New Social Contract Paradigm

Wa'ed Alshoubaki
Department of Public Administration,
The University of Jordan, Amman, Jordan

## Synonyms

New social contract theory; Paradigm; Paradigm shift; Public administration

## Definition

The term *paradigm*, according to Oxford Dictionary (2010, 3 ed), means "a typical example or

R

pattern of something; model." The word originated in the fifteenth century via Late Latin from Greek to mean to "show side by side." A *paradigm shift* means a fundamental change in approach or underlying assumption. A *science* as "a series of peaceful interludes punctuated by intellectually violent revolutions" (Kuhn 1962, p. 10).

## Introduction

The identity of the discipline of public administration was subjected to controversy for a long period of time due to the lack of a theoretical core. There are abundant narratives of public administration as a self-cognizant discipline; there are many arguments, per contra, that plagued public administration for its incapacity to be established as an independent scientific field. For instance, Wilson (1887), Goodnow (1900), and White (1926) called for the separation of politics and administration, and they argued to establish the field of public administration. As an aside, Waldo (1948) claimed that administration cannot be separated from politics because the administration views itself as a tool for contemporary democratic government rather than for maximum efficiency. Mosher (1956) argued that public administration is area of interest instead of a discipline. In the same vein, Parker (1965) contended that public administration is neither art nor science nor coherent scientific field. Kaufman (1965) and Wilson (1976) claimed the identity problem of public administration lies in the willingness of public administration to accomplish conjointly incompatible values.

In his landmark article "The Paradigms of Public Administration," Henry (1975) addressed the historical debate on the identity of the discipline of public administration by outlining the historical development of the field both in theory and practice. Henry viewed the paradigmatic progress of public administration as a step toward establishing an acceptable paradigm for the field. Reviewing Henry's six paradigms of public administration enables public administration scholars and students to understand how the field of public administration has changed over time. Furthermore, it helps in understanding the connection between public administration theory and practices. It also enhances the understanding of one of the most controversial issues in the field: the differences between politics and public administration and how separating the two sciences urged the necessity of having public administration as an autonomous field. Finally, each paradigm represents internal and external environments and the major theme in public administration ecology.

Of course Public administration as a scientific field has long been a topic of philosophical debate in terms of the discipline's identity and its ontological basis. From the politics–administration dichotomy to the public administration identity crisis and beyond, multiple interdisciplinary issues have been addressed to guide scholars and practitioners along inquiry paths to relevant solutions for the field's dilemmas. Therefore, it is possible to reflect this philosophical debate upon: first, the philosophical argument of Kuhn (1962) regarding the revolution of science and the occurrence of paradigm shifts and, second, Henry's (1975) public administration paradigms in both theory and practice for tracing the historical development of the field. The narrative review of the paradigms' development resulted in suggesting a new paradigm titled a new social contract paradigm as a nexus between politics, administration, and social protection.

## A Paradigmatic Process in Science

The philosopher of science, Thomas S. Kuhn, in 1962 in his book *The Structure of Scientific Revolution*, introduced the first time the concept of paradigm shift. Further, he broadly defined paradigm as the entire constellation of beliefs, values, techniques, and practices that constitutes a way of viewing reality shared by members of a scientific community, especially an intellectual discipline. This narrow description of paradigm is universally recognized in scientific achievements that provide model problems and solutions to community practitioners.

Kuhn (1962) defined the view of science as a stable, continuous series of amassed new ideas; alternatively, he asserted that science involves intermittent revolutionary explosions of new knowledge and that each revolution is triggered by the introduction of new ways of thought that lead to paradigm shifts and create new paradigms (i.e., theories, rules, and standards of practice). He made a connection between a crisis in science and a revolution "when blurring of a paradigm and conquest loosing of the rules for normal research, when the existing theory fails to solve the problem" (p. 84), which lead to fundamental changes in the way of thinking, and thus, the need for a change of paradigm becomes inevitable.

The overall importance of a paradigm is to provide students and scholars with borders, rules, standards, and identity in the field they are interested in studying. Moreover, a paradigm can help students frame questions, create approaches to inquiry, and select appropriate methods to answer questions and define areas of significance (Kuhn 1962).

The strength of a paradigm depends on its ability to successfully solve problems because the main concept of a paradigm is that it offers a promise of success. Further, the forte of a paradigm involves accurately identifying matches between facts, which that paradigm encompasses, accurately identifying matches between facts and the paradigm's values and practices, and increasing effort to articulate the paradigm (Kuhn 1962).

The importance of paradigms in public administration science lies in providing public administration scholars with intellectual grounds to determine the position of public administration science among all other sciences and the extent to which public administration science has its own identity. Specifically, there has been a long debate about the field's scope and theory and its ability to advance itself and create its own theories and rules. In essence, the determination of the specific paradigm of public administration enables scholars to expand the field; French, Spears, and Stanley (2005) asserted that "without a recognized paradigm, public administration lacks an identity essential for advancing the discipline and practice of public administration" (p. 135).

Moreover, multiple scholars have employed the paradigm concept in their discussion of public administration identity and paradigmatic shift. For instance, in his book *The Intellectual Crisis in American Public Administration*, Ostrom (1973) used Kuhn's (1962) perspective in diagnosing the public administration field and discussing how new scientific inquiries create a need to change existing paradigms. In his discussion, Ostrom (1973) concluded that the hallmark of the public administration field is that there is no agreement about the field's scope and theory, and thus, he asserted that public administration is in an identity crisis.

## Public Administration Paradigms

The variety of paradigms in public administration reflects the intellectual evolution of the discipline and public administration practice (Henry 1975). Woodrow Wilson (1887), in his landmark article "The Study of Administration," sparked the need for generating more intellectual resources to carry out the management of the state due to the fact that "it is getting harder to run a constitution than to frame one" (p. 362). Further, Wilson emphasized the importance of the centralization of power in government and how significant the role of constitution in determining the central power of government and the political structure that enacts law and ensures the accountability of administration. Moreover, he asserted that politics are responsible for defining the task of administrators, but the field of administration does not set the scope of politics. Referring to the importance of administration, Wilson argued that good administration is grounded in the clear hierarchical classification of professionally trained public servants to maximize efficiency as a key demand for modernity in human civilization and welfare. The boom of Wilson's article in the political and administration societies resulted in the need for public administration to become an independent field such that it could no longer be avoided, and thus he became

known as the founder of the public administration field.

**Paradigm 1: The Politics – Administration Dichotomy (1900–1926)**. Goodnow (1900), in his book *Politics and Administration*, drew the borders of public administration by refusing political control over public administration; he contended that politics create the policy that presents the state's goals and desires, while public administration is responsible for carrying out the policy. By separating the roles between politics and administration, the politics and administration dichotomy became unavoidable. Weber (1922), in his book *Politics as a Vocation*, argued for the need for separation between politics and administration because politics is impotent to control administrative power; therefore, administration should avoid the sphere of politics, and the two ought to work objectively and remain politically impartial.

The first book to construct the independent field of public administration was *Introduction to the Study of Public Administration* by White in 1926. He supported the politics– administration dichotomy by stating that politics should not encroach on administration because public administration has the ability to be "value free science" and that an efficient state can only be constructed through public administration from a management perspective, not through politics and law.

From a practical view, scholars gave more attention to the need for separation of administration from science during the civil service reform (1820–1883) due to the spread of political corruption through allocations from election winners to their supporters and hiring, promoting, and firing based on partisan affiliation. Therefore, loud outcries demanded nonpartisan and scientific methods for managing government agencies and the need for law enactment to enhance neutrality. Consequently, the Pendleton Act (1883) was established to ensure impartiality and equal opportunity.

The financial support provided to public administration assisted in creating an intellectual groundwork for what public administration ought to be and, as a result, the need to conduct studies to explore public administrative functions and how they should be developed (Henry 1975). For example, the Rockefeller family provided financial support to establish the Bureau of Municipal Research in 1906 to provide data support, consultation, and implementation advice to governmental agencies (Henry 1975).

The establishment of academics specializing in public administration and improving public service promoted a more solid existence for public administration as autonomous (Henry 1975). For instance, in 1911, Schools for Public Service was established as the first training institution for public administrators, which later merged with Syracuse University, and the Maxwell School of Citizenship and Public Affairs was declared in 1924 (Henry 1975).

**Paradigm 2: Principles of Public Administration (1927–1937)**. Effective public administration depends on learning and applying the scientific principles of administration (Willoughby 1927). Gulick and Urwick (1937) introduced the importance of administration principles to promote government efficiency; these are unlike those in scientific management, which may fit in with the private sector as well as government (Riccucci 2010). Gulick (1937) emphasized the importance of administrative principles and the role of technocrats' experience in achieving efficiency and better communication with both political leaders and the public (Fry and Raadschelders 2014). Furthermore, Gulick (1937) summarized the administrative process in the acronym POSCORB: planning, organizing, staffing, coordinating, reporting, and budgeting.

From a practical perspective, the ongoing financial support to enhance the academic existence of the field of public administration and the increasing public support for public administration reinforced the discipline; however, challenges appeared from academic entities as they cast doubt on the ability of public administration to keep going as an academic field (Henry 1975). As an illustration, a national conference at Princeton University in 1935 proclaimed that it would be difficult to establish a specialized college for public administration due to the lack of logical and theoretical roots in the field (Henry 1975). The conference statement was an introduction to the challenges against public administration.

The challenge (1938–1950). Simon (1946), in his article "Proverbs of Administration," challenged the principles of public administration, considering them proverbs that rationalize behaviors and arguing that they were unable to be verified through scientific theory due to their inability to be falsified. He also proposed that administrative principles contradict each other; for example, the unity of control contradicts the specialization principles because the latter is related to providing expertise in specific areas, but sometimes the expert is not in the same specialized area, which causes inconsistency. Moreover, the narrow span of control is incompatible with the limited number of levels in organizations because a narrow span of control implies more supervisors and more hierarchal levels.

**Paradigm 3: Public Administration as Political Science (1950–1970)**. The hallmark of this paradigm was that politics and administration could not be separated for any reason, and thus, there was a need to reconstruct the linkage between political science and public administration (Henry 1975). In essence, this paradigm proposed that politics were qualified to conduct governmental functions and that the dichotomy was a myth (Appleby 1945).

Waldo (1948) asserted that administration is inherently political and thus democratic states are reinforced by professional and political bureaucracies. He argued that scientific management and efficiency values do not represent governmental bureaucracy; they only ensure better services. In other words, the government cannot be managed like the private sector because governmental agencies' work extends beyond the implementation aspect of policy. Waldo (1952) discussed the major concepts of developing democratic administration. He pointed to the role of public administrators in supporting the constitution and securing human rights under it. He emphasized the obligation of public administrators to sustain democracy, freedom, equality, justice, and rule of law.

Waldo, Etizioni, and other scholars who were against the separation of politics and administration sought to answer the following question: "What can political science contribute to the improvement of practitioners' skills?" (Henry 2013, p. 41). This question reveals the willingness of political scientists to engage public administration in their field.

**Paradigm 4: Public Administration as Management (1950–1970)**. The generic management approach considers management to be management wherever it happens. Generic management involves tools useful for managing government because it employs mathematical and technological tools for planning and making decisions; therefore, operational research, statistics, accounting, and organization theories provided the theoretical grounds for this paradigm (Frederickson and Smith 2003; Henry 1975).

The most popular theories of the management approach were Theory X and Theory Y by McGregor (1956), which represented two types of workers in the organization: workers with negative views and traits who primarily hate work and the other, positive ones who like work and are creative. McGregor asserted that mangers should distinguish between the two types and treat each type differently due to the differences among them in goals, aspirations, and motivation.

Group theory also provided significant implications for the managerial process in organizations because effective management lies in its ability to construct, nurture, and support groups' roles and norms. Homan (1950) argued that group formulation is based on three interrelated elements: activities, interactions, and sentiments. The sharing of activities leads to more interactions and causes greater sentiment among group members. In the same vein, role theory focused on the functions of people as social actors; for instance, Gross, Mason, and McEachern (1958) argued that each person has a social role that entails a set of rights, responsibilities, norms, and goals they have to achieve.

In the late 1960s, the need for separation increased exponentially due to changes in science and technology development. In addition, the Minnowbrook Conference (1968) was held to focus on the significance of administrators in executing democratic values and to construct new public administration trends. In essence, the new public administration was a reaction against the traditional public administration, emphasizing

social equity, democratic citizenship, transparency, and client focus (Frederickson 1980).

**Paradigm 5: Public Administration as Public Administration (1970–present)**. In this phase, public administration has been successfully separated from political science and management and has become recognized as an autonomous discipline and practice (Henry 1970).

Generally speaking, this paradigm witnessed a big leap in the public administration realm because the National Association of Schools of Public Affairs and Administration (NASPAA) announced its epistemological independence and because the number of schools that teach public administration science and the number of master's programs in public administration have grown (Henry 2013).

The most influential idea to emerge from public administration was new public management, developed by Hood, which focused on the significance of management and production concepts in delivering public services in a similar way of economic rationalism; the major values of new public management are productivity, marketization, service orientation, centralization, and accountability (Kettle 2000). Along the same vein, Osborne and Gaebler (1992) in their book *Reinventing Government* urged the need for changes in government that included all policy areas and new methods to ensure better performance and cost effectiveness. They pointed to the importance of privatization, decentralization, and using business like management strategies. Moreover, information technology and the need for cyber government caused a change in the role and structure of government that reinforced governance orthodoxy. The power of networking and role of social actors in policy negotiation, execution, and delivering public services, all helped develop this new concept of governance.

**Paradigm 6: Governance (1990–Present).** Due to changes in technology, communication, the global economy, and the growth of international organizations, the increase in the role of networks in managing organizations and the growth in borrowing private sectors' tools led to abandoning the state in part of its role in providing public services through contracting them out to network and nonprofit organizations (Frederickson and Smith 2003; Henry 2013). For instance, public policies and programs in the United States of America and other countries are serving publics through a complicated net of state, local, and district agencies that collaborate through partnerships and contracts to provide public services (Lynn et al. 2000).

To conclude, the above discussion explained the basic paradigms and paradigm shifts that have occurred to determine the theory and scope of public administration in order for it to be recognized as an independent field as well as how the context and ecology of the state has impacted the public administration atmosphere.

## A Speculative Paradigm: New Social Contract

When considering the extent to which the governance paradigm is robust and useful, a general assessment of the paradigm's values comes to mind. In essence, the paradigm focuses on efficiency, costs, and private sector tools and principles. However, the public sector has a different mission, with its highest aim being to serve people under different conditions and a diverse policy structure; therefore, a market approach cannot be sustained for long and cannot satisfy all community layers under the arches of responsibility and citizenship, rather than under clientelism. The governance approach is too focused approach; it is more business oriented and prone to right-wing politics (Peters 2009).

The governance paradigm cannot be sustained anymore, and movement is inevitable because public administration needs a new philosophy that signifies social inclusion, social equity, and democratic values through citizen representation and social protection approach. This is why the field has to move away from the governance paradigm to the new social contract paradigm.

### New Social Contract

Social contract theories of the seventeenth and eighteenth centuries provided a scientific lens for addressing social progress that forms cooperation, conflict, and compliance (Jos 2006). Social

contract theories are applied to deal with challenges of contemporary public administration (Jos 2006), as proven by the fact that government has managed through different philosophies to accomplish economy, efficiency, and effectiveness. However, failure has occurred in the public sector, technological globalization and political transformation, global warming, immigration waves, poverty and famine, income inequality, and corruption. Marketization and governance principles focused on competition rather than social protection. According to Kilpatrick (2006), it is possible to fix the system through a new social contract that reconstructs the trust between leaders and their employees, helps with understanding the differences between elected and appointed officials, and corrects the use of the reinventing government and entrepreneurship concepts. Researchers have discussed the financial crisis, the increased cost of the health care sector in the United States, and other social and environmental problems that need to be tackled. By the same token, the World Bank, International Monetary Fund, and some think tanks have called for a new social contract that reestablishes a sense of security and sustaining political support for open economies; moreover, they consider that the government's role is nested in providing and financing social protection through investment in education, healthcare, and environmental protection. According to Cichon (2018), it is significant to implement national social protection systems to correct income insecurity and health insecurity and to be capable of measuring the degree of social protection that is provided to citizens. The problem of accomplishing social protection is due to a lack of sustainable public funds and the claim that redistributive spending is negatively impacting economic development, which Cichon (2018) refuted by arguing that redistributive spending contributes to economic development.

The big questions of public administration these days are calling for a new approach to management that restructures relationships to restore trust in the government. For example, Ford (2018) discussed the big questions of public administration by shedding light on the lack of trust in bureaucracy, the absence of accountability for elected officials, the gap between researchers and practitioners, and the corrosive politics. In looking into all these issues, it is crucial to create a new social contract that aims to bridge the gap between politics and bureaucracy, to rebuild the relationship between managers and their employees, to restore the trust between citizens and their government, and to redefine economic development through the lens of social protection. This provoked a suggestion toward developing a new social contract as a nexus between politics, administration, and social protection. This relationship ensures collective virtues that guarantee justice, freedom, solidarity, rights, democracy, and welfare. The new social contract covers the whole social structure, social inequality in terms of income inequality, gender inequality, and minority inequality. All of these aspects are covered by addressing essential social needs such as health care, education, housing, social security, and community-based projects. To put it simply, the new social contract will rearrange states' priorities and reframe the relationship of trust between trustees and policy makers in way that accomplishes the well-being of the people. This philosophy corresponds with the welfare philosophy and the third way to reconcile economic premises and social policies: to promote a social democratic movement and to pursue an egalitarian society (Lewis and Surrender 2004). In essence, the third way is committed to certain core values and predilections for certain types of public policy (White 2001). In this context, the new social contract will rebuild politics and administration under the arch of social democracy with a focus on forming social protection policies that are directed toward social welfare.

## Remarks and Conclusion

At this epoch, the dominated theme and paradigm of Public Administration in literature and practice is governance orthodoxy that reflects the transformational role of government in providing public services and making significant changes to the bureaucracies of public organizations. The general elements of governance are the role of networking

and multiple actors in policymaking process, decreasing states' direct control and increasing negotiation and bargaining among several actors, the merging of private and public resources, and the diversity in policy implementation instruments (Peters and Pierre 1998). Yet, there are multiple reasons for the intellectual change in public administration and a paradigm shift from governance to new social contract paradigm. This change was not arbitrary, rather it was response to academic, practitioners, and contextual matters. For instance, the increase of health care service cost, inequality in income, increase the poverty rate, housing shortages, demonstrates the need to study and provide policy relevant to people well-being. Public administration is headed toward new paradigm, which considers both social protection and democracy as major pillars of people welfare. This more contractual and an egalitarian approach basically depends on bridging the gap between politics and social welfare.

## Rethinking the Models of Police Oversight: Toward a New Paradigm

Ishmael Mugari
Department of Intelligence and Security Studies, Bindura University of Science Education, Bindura, Zimbabwe

### Synonyms

Civilian oversight of police; Police accountability; Police oversight models

### Definition

The police oversight model refers to the mechanisms or systems that are in place to handle incidents of police misconduct. Incidents of police misconduct can be handled internally or by an outside body or institution.

### Introduction

The policing function, among other governmental functions, is arguably the most visible and the most intimately involved with the well-being of individuals in communities. Consequently, police organizations occupy an important position in the engagement between governments and their citizens. The police are also invested with far-reaching powers and a significant degree of discretion in order to perform their duty: to uphold the law and protect citizens. They have the power to contravene the rights of citizens in circumstances where it is legally permitted, and they also have a duty to protect innocent people and to be accountable to the public.

Exercising of police powers (which are often intrusive) not only creates tensions between the police powers and citizens in a democratic society but also endangers the rights and freedoms of the citizens if such powers are not regulated and checked. There is therefore a need for checks and balances in order to curtail misuse of the police powers. The general consensus is that police in a democratic society must operate according to the basic tenets of democratic governance, which include principles of accountability and transparency.

The tradition of police oversight emerged in the latter part of the twentieth century in response to a number of commissions of inquiry and exposes of corruption, misconduct, and criminal activity by police officers. Examples of such commissions include the Knapp Commission (1972) and Mollen Commission (1994) in the United States, the Scarman Report (1981) in the United Kingdom, and the Fitzgerald Inquiry (1989) and Wood Royal Commission (1997) in Australia (Porter 2013). All the commissions called for the creation of independent agencies to increase external accountability for police (Porter 2013: 169). Around the globe, nonpolice engagement in complaints procedures is to be found at the heart of police reform programs that are carried out in the name of modernization in established democracies (Smith 2013). In Europe, since the introduction of the Police Complaints Board for England and Wales in 1977, nonpolice oversight bodies have been set up in counties such as Belgium, Cyprus, France, Hungary, and Ireland (Smith 2013).

The challenge of police accountability in most African countries dates back to the colonial era when the settler forces, armed with draconian laws, used excessive force on Africans as a way of both exploitation and prevention of black

majority rule. Dissel and Tait (2011) concur that policing in Africa in general has historically been defined by colonial rule and a typically military practice that is more concerned with upholding the interests of the colonial powers than in meeting the security needs of the local populations. The dismantling of colonial rule provided the best opportunity for African nations to redefine the nature and practice of policing. However, this redefinition has been frequently impeded due, in part, to the legacy of colonialism and also to political, social, and economic conflicts that have plagued the continent for the past 20 years. To this end, most African countries inherited repressive policing styles from their predecessors, and the repression even continued well after attaining independence. In view of the foregoing colonial legacy and postcolonial preservation of police repression and impunity, there is a need to develop and sustain effective police oversight or accountability mechanisms as part of the struggle for and process of democratic consolidation in Africa.

Lumina (2006) also notes that over the years, the involvement of police in systematic abuses of human rights in many African countries has underscored the need for oversight of their actions. In South Africa, for instance, Berg (2013) notes the institutionalized nature of police brutality and lack of transparency or accountability prior to South Africa's transition to democracy. Thus, during the apartheid era in South Africa, there were virtually no efforts at monitoring such abuses as police-related deaths and allegations of torture. In Zambia, Shezongo-Mcmillan (2013) highlights torture, arbitrary arrests, excessive use of force, and prolonged pretrial detention which even dates back to the pre-independence era as the major rationale behind the need for police accountability.

It is against this background that the aspect of police accountability has taken center stage in the modern-day policing discourse. To this end, oversight agencies have been created with differing models and powers, and there are diverse police accountability mechanisms across the globe. The diversity and the evolving nature of police oversight across the globe have spurred development of diverse literature on the subject of police accountability. While authors seem to differ on the mechanisms of police accountability, some of the differences seem to be more of semantics than substance.

## Models and Mechanisms of Police Oversight

Since the concept of police accountability began to take center stage, different authors have proffered different models and dimensions of police accountability. Perhaps a clearer classification on the models of police accountability was given by Prenzler and Ronken (2001), who identified three models of police oversight, namely, the internal affairs model, the civilian review model, and the civilian control model. Though the models have been modified by various authors in subsequent years, the three models still remain the bedrock for systems of police accountability. In 2005, the Police Assessment Resource Center (PARC) conducted a study in which they came up with models of police accountability, and these are (1) investigative and quality assurance models, which replace the internal affairs model in whole or in part; (2) review and appellate models, which review completed police internal investigations; and (3) evaluative and performance-based models, which evaluate police performance and other organizational systems to promote accountability. Quinn (2009) identified three models of civilian oversight which all fall under the external accountability mechanisms. The three models are the investigative model, the monitoring model, and the auditor/ombudsman model with the power to compel evidence. Another classification was provided by Attard (2010: 1550) when he highlights the investigative model, the boards and commissions, and the auditor/monitor agencies. Attard and Olson (2013) identified three agencies of police oversight, namely, the investigative agencies, auditing/monitoring agencies, and review boards and commissions. In what seems to be a matter of semantics, De Angelis et al. (2016) identify three models, namely, the investigation-focused model, the

review-focused model, and the auditor-/monitor-focused model.

While Prenzler and Ronken (2001) highlight the internal affairs model as an important internal mechanism for police accountability, other models (Quinn 2009; Attard 2010; Attard and Olson 2013; De Angelis et al. 2016) seem to focus on external oversight mechanisms, and as will be seen in this paper, they seem to have developed as a result of the shortcomings with the internal affairs model. Despite the various models that are available, this paper analyzes three models, namely, the internal affairs model, the civilian review model, and the civilian control model. The paper also highlights the need for a compromise – a hybrid model, which becomes the fourth model of police accountability.

## The Internal Affairs Model

Under the internal affairs model, the police department is responsible for receiving complaints alleging misconduct by police officers or complaints about police policies, practices, and procedures. In response to corruption scandals and the inflow of complaints against police officers, larger police departments have established dedicated internal affairs units to conduct investigations into police misconduct and, in some cases, initiate prevention programs (Prenzler and Ronken 2001; Brown 2012). The move on the part of political leaders and the general public to hold the police accountable for their actions has prompted police leaders to focus on the issue of how they should be held accountable (Brown 2012). There is thus need for self-introspection on the part of police leaders to put their house in order; otherwise someone from outside the organization will do so. Thus, if police leaders do not respond to the rapidly changing dynamics of society, they can expect to see external forces exert influence in their organization. In support of the internal affairs model, Roberts and Herrington (2013) argue that organizations must first address their internal issues and get organizational justice appropriately aligned before they can address wider issues of procedural justice: their accountability and legitimacy in the eyes of their communities. It is thus necessary to formulate a plan to improve and enhance organizational justice which should address internal issues – the need to put one's own house in order. The mechanisms for internal oversight are generally provided for in terms of regulations governing the police, and disciplinary procedure is one of the key aspects of the internal affairs model. In support of the internal affairs model, Porter (2013) highlights that codes of ethics, ethics training, support of employees who report misconduct, and integrity-based promotions criteria are increasingly in use within police agencies.

The internal affairs model has received its fair share of criticism. Several authors who advocate for civilian oversight stress the pathological inability of police to objectively investigate their peers. As a result of inherent bias, police departments have often been accused of not pursuing allegations on fellow officers with the same rigor seen in ordinary criminal inquiries (Prenzler and Ronken 2001). Policing scholars argue that the system whereby only the police are competent and capable of investigating the police is patently flawed, unsatisfactory, and contrary to public expectations. It is thus argued that internal investigative mechanisms that are operated solely by the police will have little credibility with either complainants or the public (De Angelis 2009). What is required is a system that can assure the public that complaints about police misconduct will be dealt with in a fair and objective manner, to the satisfaction of the complainant.

Long-standing empirical research has also demonstrated that police officers display a high level of loyalty to their colleagues. This means that police officers are increasingly expected to tolerate, although not necessarily condone, misbehavior by other officers. The insularity of police institutions and the solidarity of rank-and-file police officers create an impervious shield around these institutions, which, by their nature, is most deserving of transparency and public accountability (Simmons 2010). The issue of loyalty is summed up by the term "blue wall of silence," which is a protective barrier erected by the police in which officers protect one another from outsiders, often refusing to aid police superiors or other law enforcement officials in investigating

the wrongdoing of police officers. Another argument for the internal affairs model is that if the monitoring comes from outside the police, it tends to rouse opposition of police managers as well as the rank and file (Quinn 2009). There is also an argument that disciplinary actions are sometimes seen as internal to police and an instrument of police management rather than a true form of accountability.

### The Civilian Review Model

Proponents of the civilian control model argue that the police must understand themselves as subservient to the community and should allow citizens to evaluate their performance. The main institutional response to the problem of police bias in internal investigations has been to establish civilian review agencies. The civilian review model arose in response to concerns about such matters as police bias and lack of robustness associated with the internal affairs model and covers a number of forms of external, nonpolice engagements with processes of dealing with complaints and misconduct (Savage 2013). The model involves police conducting investigations and determining disciplinary actions, with the external agency playing a monitoring role. This may involve ex post facto reviews of complaints investigations undertaken by the police by a panel made up of some or all lay or civilian representatives, the ongoing monitoring of misconduct investigations undertaken by the police, and the active supervision of complaints and misconduct investigations undertaken by them.

The civilian review model can be equated to the monitoring model (Quinn 2009) in which an individual or a board is authorized to review internal affairs investigations of complaints. The role of the board/commission will thus be to check the adequacy of the internal investigations, as well as to make policy recommendations. The civilian review model can also be equated to Attard's (2010) auditor/monitor model. Auditor/monitor oversight agencies review and analyze internal affairs investigations of police misconduct and have broad authority to evaluate policies and procedures of law enforcement organizations with an eye toward preventing future misconduct. Quinn (2009) highlights that the board will provide a firm, fair, and consistent internal review of internal affairs investigations in order to provide consistent law enforcement services and better management. To this end civilian oversight bodies generate a climate of accountability, openness, and transparency in the communities they serve. Civilian review boards thus have the strengths of opening internal police investigations to scrutiny by outsiders and often providing for participation by multiple community members on board, thereby allowing various groups in the community to perceive that their perspectives are represented.

The most notable system under the civilian review model is the creation of the civilian review boards. Civilian review boards do not only represent citizen participation in processes to check for police accountability and misconduct, but they can also improve general public satisfaction with police (De Angelis 2009). An ideal civilian review board should include academics, nonacademics, and legal professionals as members. Lumina (2006) also highlights Parliamentary Committees, whose review role entails scrutinizing government activity including legislation, the conduct of public officials, and policy issues. In this vein, the Parliament Committees can review police actions and police policy and provide recommendations where police policy and actions are not in line with democratic principles.

The major drawback of the civilian review model is that civilian review boards are quite limited in the scope of their powers. An important point to note is the fact that they are authorized to do no more than find that a specific case was not competently or fairly handled and to request that the identified problem be corrected. As they perform their review tasks, they do not receive the same level of cooperation from police officers as do the police internal affairs unit investigators (Brown 2012: 338). Though the review boards in some jurisdictions may also conduct public hearings, such hearings are informal, and the rules of evidence are not strictly applied (Brown 2012). Another argument by Quinn (2009) is that

if the board is inadequately skilled and/or trained to examine, then the board may not recognize problems in investigations. Due to the need for cooperation between the internal affairs investigations and the civilian review board, this model is also vulnerable to being co-opted. This co-optation was noted by Burger and Adonis (2008) when they highlight that the Independent Complaints Directorate (ICD) in South Africa had to remain dependent on South African Police Service (SAPS) during the course of an investigation. In most jurisdictions, though most independent police complaints boards investigate cases, they can only make recommendations of action to be taken following their findings. In this respect, the review board will be a toothless institution.

### The Civilian Control Model

This model is established on the principle that police should not investigate the police (Savage 2013) and is premised on the concern on whether police can impartially investigate allegations of abuse of power involving one of their own. The question of who investigates the police is not one that has been easily answered, and instead different structures and mechanisms have evolved through history of policing to address the issue (Doherty 2013). The model involves independent investigations of complaints by an independent board or commission. The purpose of giving investigative powers to the board or commission is to increase public confidence that investigations of police officers would be conducted with greater scrutiny and fairness. Another reason, as suggested by Porter (2013), is that police internal investigations were biased toward implicated officers, being at best too lenient and, at worst, engaging in intimidation of complainants and witnesses. Civilian oversight is premised on, inter alia, the inability or unwillingness of the police to police themselves in a manner acceptable to the public and the public's belief that independent investigation of police misconduct is fairer and more objective.

Several systems are in place for the civilian control model. The most notable is the ombudsman. The word ombudsman refers to an office occupied by a single individual who is empowered and resourced to investigate citizen complaints about the manner in which they have been treated by government officials (Doherty 2013: 25). The independent police complaints commission is also another important system for the civilian control model, in which members of the public can directly file their complaints against the police. While the ombudsman deals with complaints against all other government departments, the independent police complaints commission only deals with complaints against the police. The Human Rights Commission is another means of holding the police accountable in cases of misconduct, abuse of power, or police excesses. This is usually a constitutional board which is authorized to inquire into complaints of violation of human rights by a person, government agency, or institution.

Despite widespread calls for civilian control of police misconduct, concerns have been raised over the competency of investigators and their capacity to penetrate the police world (Prenzler and Ronken 2001; Simmons 2010). The investigation of police complaints involves dynamics different to those in normal criminal investigations (Prenzler and Ronken 2001), hence the need for specialized skills which external argents may not possess. The lack of expertise in police tactics, strategy, and policy has prevented many boards from effectively handling cases of police misconduct. It is also difficult to penetrate the police organization due to the strength of the police culture and police knowledge of how to evade prosecution. The issue of the "code of silence" also presents a challenge for obtaining evidence from police officers when investigating fellow officers. In South Africa, Berg (2013) notes the absence of cooperation between the police and the independent investigators during the ICD era. The absence of cooperation was created by the desire to protect police officers who were under investigation. It has also been argued that outside discipline can be counterproductive because it undermines the willingness of the police to discipline itself. Another important argument is that the ability of an outside group to affect the behavior of police officers is more limited than that of the police organization itself.

## The New Imperative: The Hybrid Model

An analysis of the three models discussed above clearly shows the challenges that characterize both having a purely internal oversight mechanism and a purely external oversight mechanism. Though Prenzler and Ronken (2001) seem to be the only notable proponents of the internal affairs model, the importance of this self-regulating mechanism cannot be wished away. For example, internally generated minor incidence of police misconduct needs to be dealt with internally, rather than involve external institutions/agencies to deal with frivolous internal matters. Conversely, major incidents of police misconduct warrant an independent impartial investigation, thus the need for an external oversight agency. An objective assessment of the three models of accountability clearly highlights the challenges in comparing the models in order to pick up an appropriate one. Moreover, each model is not a "one size fits all," and a model that works in a particular jurisdiction may not work in other jurisdictions. De Angelis et al. (2016: 15) correctly point out that every jurisdiction has its own social, cultural, and political issues, and every police agency has its own unique organizational history, tradition, and subcultural characteristics. To this end, a single accountability mechanism/model may not adequately address issues of police accountability in a given jurisdiction. Moreover, evidence that any one oversight approach is more effective than another does not yet exist.

Perhaps a more practical approach would be to have a compromise between a purely internal accountability mechanism and a purely external accountability mechanism. Such a compromise brings to the fore the fourth model of police accountability – the hybrid model. Calderon and Hernadez-Figueroa (2013) importantly note the current trend to incorporate aspects of both internal and external models into a hybrid model. Although there are a variety of hybrid models, the most common is a combination of civilian and police personnel (Brown 2012). This combination of police and civilian staff can take place during the investigative stage and at review stage. Shared responsibility for investigation between police and external oversight agencies represents best practice as well as good value for money. Given the "blue wall of silence," it makes sense to involve the police officers in the investigations, as they are more likely to be able to circumvent the "blue wall of silence" as compared to their civilian counterparts. However, it is imperative that civilian personnel within the oversight body take a leading role in the investigations.

Another alternative put forward by Smith (2013) entails a two-tier complaints system, with the majority of complaints investigated by the police and serious incidence investigated by a separate body. Such a system has increasingly become a norm in European jurisdictions. The system is also premised on the need to give the police command autonomy to deal with minor incidents of officer misconduct. While the police should be allowed to handle all cases of minor misconduct, a civilian oversight body will still be needed to subject all the internal disciplinary processes to scrutiny. It can thus be argued that the hybrid model is inevitable due to the fact that it is difficult to completely exclude the police when dealing with officers' misconduct.

Among the qualities of an effective police oversight body is that the independent body should enjoy the confidence of both the public and the police. Given the evidence against a purely internal accountability mechanism, police officers are likely to support a compromise, in the form of a hybrid model. Similarly, the public will have a bit of confidence in a mechanism in which nonpolice officers are involved in the investigation of police officers' misconduct.

## Conclusion

Despite long-standing research on the models/mechanisms of police accountability, the perfect model seems to be elusive. Though much of the literature gravitates toward support for civilian oversight for police misconduct, the need for self-introspection through internal mechanisms cannot be overlooked. While different external civilian oversight mechanisms have been called by various names, they however seem to converge into two

main models: the civilian review model and the civilian control model. An expose of the inherent weaknesses for both a purely internal mechanism and a purely external oversight mechanism, as revealed in this paper, calls for the need for a compromise in the mold of a hybrid model. Having police officers as part of the investigators among other civilian members will reduce police officers' resistance to scrutiny. Moreover, both the police and the public are likely to have confidence in the inclusive oversight capability of a hybrid model.

## Introduction

Achieving an effective and efficient government remain a persistent challenge for governments in both developed and developing countries; this has led to frequent experiments with different concepts. One of such concepts is decentralization,

which was in vogue during the 1980s particularly among governments in developing countries (Rondinelli and Cheema 1983). Proponents of decentralization hailed the concept as key to achieving accountability and efficiency in local governance. Indeed, Faguet (1997) suggests that decentralization is the panacea for corruption, clientelism, and political alienation often associated with centralized government. Similarly, Bardhan and Mookherjee (2006) conclude that decentralization creates opportunities for citizens to communicate their preferences and views to elected officials, which ultimately leads to greater participation and responsiveness.

Ghana's experiment with decentralization dates back to 1957 when the country gained independence from British rule (Ayee 1996). Yet, the current structure of a four-tier metropolitan, three-tier municipal, and district assembly system was adopted in 1992, following promulgation of the Fourth Republican Constitution of Ghana (Ahwoi 2010). Based on this structure, there are three categories of local government bodies: Metropolitan assemblies, municipal assemblies, and district assemblies. Current records indicate that there are 216 metropolitan, municipal and district assemblies in Ghana.

Despite Ghana's relatively long experiment with decentralization, students and scholars of public administration conclude that the outcomes of decentralization in Ghana have been generally disappointing (Crawford 2009). In explaining the disappointing outcomes of decentralization, Ayee (1996, pp. 48–49) claims that "... the decentralization program failed to achieve its stated objectives because the government did not provide the legal basis for it prior to the establishment of the District Assemblies... the initiative to change the framework has to come from the government." Further, Crawford (2009, p. 58) suggests that the deficiencies of decentralization in Ghana reflect a disconnect between "local political participation and local government accountability." More recently, a study by Yeboah-Assiamah (2016) found that factors such as excessive executive authority over local government bodies, unfavorable legal regime, weak autonomy on the part of local government bodies to initiate developmental programs, and financial constraints undermine the progress of Ghana's decentralization.

While these explanations are useful, they offer a partial account by ignoring the impact of certain statutory provisions in the 1992 Constitution of Ghana and the Local Government Act, 1993 (Act 462) on decentralization. Specifically, these provisions are those that withhold autonomous decision-making authority from local districts to plan and implement their policies and those that empower the President to appoint all District Chief Executives and 30 percent of the membership of the local district assembly. Using path dependence theory, this paper seeks to provide a thorough explanation for the poor performance of decentralization in Ghana. It does so by highlighting how these provisions have created a path for practicing decentralized governance in ways that make it extremely difficult, if not impossible, to achieve accountability and efficiency.

## Theoretical Context: Path Dependence Theory

Path dependence (PD) theory has its intellectual roots in the works of David (1985), who sought to explain why sub-optimal technologies remain industry standards while new and superior technologies exist. In expounding his argument, David (1985) drew insights from how the "QWERTY" row in computer keyboards remains the preferred choice of manufacturers and consumers despite the more efficient "DSK" keyboard. David's (1985, p. 332) basic proposition in explaining PD was that "one damn thing follows another." By definition, PD means "that what happened at an earlier point in time will affect the possible outcomes of a sequence of events occurring at a later point in time" (Sewell 1996, pp. 262–63). For Levi (1997, p. 28), "Path Dependence has to mean, if it is to mean anything, that once a country or region has started down a track, the costs of reversal are very high. There will be other choice points, but the entrenchments of certain institutional arrangements obstruct an

easy reversal of the initial choice." From these definitions, PD theorizes that current socio-political events and processes are effects of previous occurrences that are difficult to overturn. In short, history matters, and it matters because it helps in explaining the paths followed by organization in their quest to perform their mandated responsibilities (Steinmo 2008).

Since its emergence, PD has remained an influential theory among social science scholars, using it to explain a wide range of socio-political processes such as labor incorporation in Latin America (Collier and Collier 1991). In applying PD to this study, the paper argues that the poor performance of decentralization in Ghana can be traced to long-established statutory provisions embedded in the 1992 Constitution of Ghana and Local Government Act, 1993 (Act 462). These challenges relate to PD because the statutory provisions mentioned previously have created a path for practicing decentralization in a manner that undermines accountability and efficiency in local governance in Ghana. For instance, both the 1992 Constitution and Local Government Act, 1993 (Act 462) empower the President to appoint the District Chief Executivee (DCE) for all 216 districts in Ghana as well as 30% of the membership of all local district assemblies. Under such arrangements, both DCEs and those appointed to serve in the local assembly are more likely to serve the interest of the President, and this undermines accountability to citizens at the local government level.

## Policy Alternatives to Resolve Problem

From the foregoing argument, this paper suggests two policy alternatives to address the challenges of decentralization in Ghana. The first alternative is amendment of provisions that empower the President to appoint District Chief Executives (DCEs) and 30% of the membership of the local district assembly. According to Section (20) of Ghana's Local Government Act, 1993 (Act 462), "there shall be a District Chief Executive for each district who shall be appointed by the President with prior approval of not less than two-thirds majority of the members of the District Assembly present and voting at the meeting." Similarly, Section five (5) of the Act stipulates that membership of the district assembly shall consist, among others, "other persons not exceeding 30 percent of the total membership of the Assembly appointed by the President in consultation with the traditional authorities and other interest groups in the district." Further, Article 243 (2) (a) of the 1992 Constitution permits the DCE to preside over the Executive Committee of the District Assembly, while Article 243 (2) (b) enjoins him/her to carry out day-to-day activities of the district. In this situation, it stands to reason that DCEs and members of the district assembly appointed by the President are inclined to serve the interests and desires of the President rather than serving the interest of local citizens. Agrawal and Ribot (1999, p. 94) corroborate this claim by arguing that "if powers are decentralized only to actors who are not accountable to their constituents, or who are accountable to themselves or to superior authority within the structure of government, then decentralization is not likely to accomplish its stated aims."

For effective accountability, the current arrangement needs to be amended to enable citizens to elect their local political leaders (DCEs), as well as all members of the local district assembly. Indeed, evidence in the public administration literature suggests that such an arrangement is more likely to enhance accountability and participation. For example, Antwi-Boasiako (2010, pp. 168–169) in a study titled: *Public Administration: Local Government and Decentralization in Ghana* suggests that "local accountability becomes effective where local leaders are elected by their own people. . .such a reform may force elected officials in the constituencies to be more accountable to the electorates instead of satisfying the wishes of a distant executive." Similarly, Taylor (2003) suggests that political decentralization correlates with accountability, responsiveness, and innovative leadership. Clearly, the effectiveness of decentralization could be enhanced by changing the current arrangements,

allowing DCEs and all members of the district assembly to be elected.

The second alternative is for central government to grant full decision-making authority to local government districts in the areas of development planning and fiscal legislation. On one hand, this reform will allow local districts to formulate and implement policies that directly meet their developmental needs, without undue interference from central government agencies such as the National Development Planning Commission. This recommendation is based on the understanding that local districts have developmental needs unique to their contexts and must have full authority to develop and implement policies to address such needs. In situations where policies from central government clash with those from local districts, it behooves on both parties to negotiate and reach agreements that satisfy their common interests. But, under no circumstances should local initiatives be thwarted to give way to policies from central government.

On the other hand, fiscal legislation authority will empower local districts to impose levies to raise adequate funds to execute their developmental objectives, without unduly on central government transfers such as the District Assembly Common Fund (DACF). Empirical evidence suggests that central government transfers are unreliable due to delays (Yeboah-Assiamah 2016), and in some cases disbursements have actually not been transferred (Ayee 2000). Thus, granting authority to local districts to impose taxes will enable them to raise adequate funds to implement their development plans, because they will not over-depend on transfers from central government.

## Policy Recommendation

Of the two proposed policy alternatives to deal with the challenges of decentralization in Ghana, the most feasible alternative is the amendment of "unfavorable" provisions in the 1992 Constitution and the Local Government Act 462 (1993). These provisions are those that empower the President to appoint DCEs and 30 percent of the membership of the local district assembly.

Since the current relationship between central and local governments is based on provisions in the 1992 Constitution and the Local Government Act 462 (1993), the provisions indicated above should be amended to improve accountability and efficiency in local governance. The proposed amendment can improve decentralization in at least three ways: first, ceding the appointment powers of the President to citizens would ensure that DCEs and the 30 percent membership of the local assembly are directly elected by the people. Consequently, these elected officials will be accountable to their electorates, not the President. Crawford (2009, p. 69) supports this claim by suggesting that "one way to increase downward accountability of the DCE is to make this [office of the DCE] an elected post." Similarly, Ribot (2002, p. 3) has argued that local participation is likely to be more effective when local government holds "significant domains of discretionary power." Second, local government districts will have full autonomy to plan and execute developmental policies that directly meet their needs without interference from central government. Third, local government districts will have authority to mobilize financial resources to execute their developmental agendas.

Following the logic of Path Dependence theory, implementation of the most feasible proposal implies creating a new path for practicing decentralization in Ghana. Such an action will be a critical juncture, closing off the current arrangements and establishing a new path (based on the proposed amendments) that will generate self-reinforcing path-dependent processes (Capoccia and Kelemen 2007, p. 341). In the new path, citizens will elect all DCEs and members of the local assembly, making these officials accountable to their electorates. Similarly, local government districts will have full powers to plan and implement policies that meet their developmental needs without central government control.

As consistent with the PD literature, this paper acknowledges that amendment of the current

decentralization system in Ghana might be potentially costly. For instance, the President will be stripped of his power to appoint DCEs, implying a potential loss of control over district affairs. Nevertheless, such a cost, when weighed against the benefits of effective accountability and efficiency in local governance in Ghana, is worth paying. After all, to use insights from Utilitarian philosophy, the greatest number will be served.

## Conclusion

Using path dependence theory, this paper sought to demonstrate that the poor outcomes of decentralization in Ghana are the effects of long-established statutory provisions embedded in the 1992 Constitution of Ghana and the Local Government Act 462 (1993). Together, these provisions have created a path for practicing decentralization in a manner that makes it extremely difficult to achieve effective accountability and efficiency in local governance. To improve local governance in Ghana, the paper proposes two alternatives: (1) amendment of provisions in the Local Government Act 462 (1993) and the 1992 Constitution of Ghana that empower the President to appoint all DCEs and 30 percent of the membership of the local assembly; and (2) granting full authority to local assemblies to formulate policies and impose taxes to mobilize funds for implementation, without succumbing to policies from central government.

The most feasible of the two alternatives is amendment of provisions that empower the President to appoint DCEs and 30 percent of the membership of the district assembly, allowing citizens to elect such leaders. As supported by the literature, such an arrangement is more likely to improve accountability and efficiency in local governance in Ghana.

# Retirement Contributions, Russia

Oxana Sinyavskaya and Anna Ermolina
Institute for Social Policy, National Research University Higher School of Economics, Moscow, Russia

## Synonyms

Insurance contributions – retirement contributions; Russia's pension fund; The pension fund of the Russian Federation – PFR

## Definition

*Insurance contributions towards the mandatory retirement insurance (retirement contributions)* are mandatory payments made to Russia's Pension Fund (PFR – *Rossiisky pensionnyi fond*) to ensure the citizens' right to receive guaranteed pensions from the state-run pension system.

*Length of insurance period* is the total length of periods of employment and other paid activity for which retirement contributions are due and paid to the PFR, as well as other periods (paid maternity and parental leaves, military conscription service, etc.) counted towards insurance period.

## Introduction

Retirement contributions are the key element of pension systems which redistribute incomes during an individual's life cycle. Special-purpose contributions made by employees and/or employers by withholding certain amounts from wages form the income to be enjoyed after retirement from labor market. Thus, retirement contributions are a particular case of social insurance aimed at ensuring a certain standard of living after a person reaches a certain age (OECD 2013).

The importance of retirement contributions is greater in defined-contribution schemes, where the pension benefit depends on the total amount of paid contributions. By contrast, in defined-benefit schemes, popular in the twentieth century, the pension benefit usually depends on the length of residence, or work experience and, in some cases, the wage rate during a certain period in the pensioner's career, but it is not directly linked to the contributions.

In Russia, the transition to a defined-contribution system took place in 2002. Before that pension benefits were usually calculated on basis of information about the individual's wages and records in employment record books (*trudovaya knizhka*), which helped determine the length of an individual's work experience.

However, it should be pointed out that over the last 26 years of Russia's history its approaches to retirement contributions have been changing many times – not only was a defined-benefit system replaced with a defined-contribution system, but there were also periods when the contributions were replaced with taxes; when contributions were paid jointly by employers and employees; when a portion of the contributions was paid to a pay-as-you-go (PAYG) pension system and another, paid into individual funded accounts, was invested on financial markets. And retirement contribution rates have been changing many times as well.

Presently, the contributions paid by employers do not suffice to pay pensions to present-day retirees. So, the state co-finances the pension system almost on an equal level with employers, using transfers from the federal budget to cover the difference between contributions and payments.

This entry will review the evolution of approaches to retirement contributions in Russia, compare the rates of current retirement contributions in Russia and some other countries, and describe the structure of financing of the Russian pension system.

## Retirement Contributions Rates in Russia

Unlike in European countries, employees in the USSR did not pay any retirement contributions.

The USSR did not have a system of social insurance, although the norms set for the pension system were somewhat similar to the Bismarckian defined benefits system. Pensions of Soviet citizens were financed from the so-called funds of public consumption, which consisted of employers' contributions (between 4% and 12% of the payroll depending on the industry sector) and funds from the national budget. And by the late 1980s, the state budget already accounted for nearly half of the pension expenditures.

After the breakup of the USSR, the new law No. 340-1, adopted in 1990 and called "On State Pensions in the Russian Soviet Federative Socialist Republic," provided for the creation of a special off-budget fund, the Pension Fund of the Russian Federation (PFR), which would accumulate contributions of employees and employers and finance pensions. That was arguably the beginning of the history of pension insurance in Russia. The rate of retirement contributions for most employers was 20.6% in 1991, 31.6% in 1992, and 28% in 1993–2000. The rate of employees' contribution was minimal: 1% of a wage (Sinyavskaya 2011). Up until 2002, pension benefits were calculated as a percentage of the wage received during the last 2 years of employment (or during 5 years when the wage was maximal), provided the pensioner had worked for a certain period of time (20 years for women and 25 years for men) and reached a retirement age (55/60 years old for women/men correspondingly). In 1991–1997, the maximum size of pension benefit could not exceed three minimum pension benefits. In 1998–2001, a new pension formula that took into account the ratio between individual and average wage in the economy was introduced in addition to the previous one.

In the 1990s, the economic and financial crisis, as well as the absence of a clear link between retirement contributions and pension benefits, resulted in a massive retirement contribution evasion. The employers' and the state budget's contribution arrears to the PFR, in turn, triggered pension benefits arrears.

The tax reform in 2000 abolished employees' retirement contributions, and employees' payments to the PFR and other social insurance funds were replaced with the unified social tax (UST) with regressive rates. Initially, the UST was designed to relieve the tax burden of employees and employers, but as employees' contributions were abolished, employers came to see the UST as yet another kind of tax. The Russian Tax Code as amended on December 29, 2000, set the UST rate at 35.6%, including 28% of the portion of an employee's wage not exceeding 100,000 per annum payable to the PFR (Part II of the Russian Tax Code No. 117-FZ, as amended on December 29 2000a). Incomes of higher-paid employees were taxed at a lower rate. Beginning from 2002, tax payments to the PFR were replaced with payments to Russia's federal budget. Despite the growth of wages, the thresholds for the UST contributions were not indexed, which resulted in a decline of the amount of possible contributions per pensioner. From May 1, 2005, onwards the maximal rate of UST was reduced to 26%, and the thresholds for contributions were raised. The purpose of this move was to entice businesses out of the shadow economy but this did not happen. The decrease of the UST rates was not compensated with an expansion of the tax base, so the stream of tax payments to the PFR shrank further, which was one of the causes of the deficit at the PFR (Sinyavskaya 2011).

Since 2002, Russia has had a new, multi-pillar pension system, consisting of the universal basic component; the so-called insurance, or PAYG, component organized on defined-contribution principles (which was very similar to the notional defined-contribution accounts existed, for instance, in Sweden or Poland); and the mandatory funded component. Calculated on basis of defined contributions, the sizes of insurance and funded parts of pension benefits depended on the amount of paid contributions and indexation of notional pension capital (in the insurance component), or investment income (for the funded component). Changes in the pension formula enhanced the importance of retirement contributions.

Furthermore, in the 2002, pension formula the indexation of both pension benefits and notional pension capital were linked to the growth of the total amount of UST paid for insurance part of

pension per one pensioner. Therefore, the indexation rate depended on the ratio between contributors and pensioners as well as on the effective UST rate, which determined the total amount of taxes paid to the PFR. Decreases in the UST's effective rate used to bring down the indexation levels of insurance pensions and of the notional pension capital. Which, in turn, caused pensions to grow more slowly than wages.

From 2010 onwards, the UST was again replaced with retirement contributions. The rate of insurance contributions in the mandatory pension scheme amounted to 20%, payable from all annual incomes not exceeding 415,000 rubles (Sinyavskaya 2010). It was resolved to regularly index the "ceiling" of the portion of the wage from which the contributions were due. In 2011, the retirement contribution rate was raised to 26%, but already next year (2012) it was down to 22%, to relieve businesses' tax burden. The rate of retirement contributions payable by employers – 22% from the capped basic portion and 10% from the amount exceeding the base – is still valid and will be until 2019 (Federal Law No. 167-FZ Dated December 15, 2001). In 2017, the cut-off "ceiling" for insurance contributions towards the mandatory pension insurance was 876,000 rubles per annum (Russian government's Directive No.1255 Dated November 29, 2016).

Since 2002, Russia has had mandatory funded pension component. This component of the pension system was applied, in 2002–2004, to men born in 1953 or later and women born in 1957 and later. Since 2005, only individuals born in 1967 or later remained participants of the individual funded pension accounts. The rate of employers' contribution for this group of employees was gradually growing from 1% to 6% of a wage. For this category of employees, the contribution rate towards the PAYG component – the insurance part of pension – was lower than the total contribution rate to the rate paid to the funded component.

In 2014–2015, persons born in or after 1967 could choose a future pension plan: either the insurance scheme alone or the insurance and mandatory funded schemes simultaneously. Those who, submitting relevant applications, opted for a private pension fund or chose an investment portfolio of their private asset manager pay 6% out of 22% of retirement contributions towards the funded component, and the remaining 16% towards the insurance component. Insurance-only pension plans were the option set by default for the other categories of contributors.

However, in 2014, Russia froze the funded component because of a deficit of resources in the pension system. Instead of the funded part, all retirement contributions of all employees were channeled into the PAYG part to pay pension benefits to current pensioners. Later, the freeze was extended to 2015–2019 and its possible abolishment still remains a matter open to debate (Federal Law No. 447-FZ Dated December 19, 2016).

Unlike the retirement contributions paid by employers for their employees depending on the latter's wage amounts, self-employed, individual entrepreneurs, defense lawyers, mediators, notaries, and some other Russians in private practice have to pay mandatory pension insurance contributions irrespective of the presence and amount of their business revenue in a given year. If an individual entrepreneur during a year earns less than 300,000 rubles, the fixed contribution amount (s)he has to pay would be 26% of the annual minimum wage (MROT – *minimalnyi razmer oplaty truda*) as of the beginning of the year. Considering that on July 1, 2016, the MROT was raised to 7,500 rubles, the individual entrepreneurs' fixed retirement contribution for 2017 will be 23,400 rubles. If an individual entrepreneur's annual income exceeds 300,000 rubles, the fixed insurance contribution into the mandatory pension insurance plan includes 1% of the amount exceeding this threshold. The maximal amount of retirement contributions set for individual entrepreneurs, defense lawyers, mediators, and other relevant categories of tax payers may not exceed the MROT x 8 (Part II of the Russian Tax Code No. 117-FZ Dated August 5, 2000b, as amended on April 3, 2017).

Retirement contributions should be paid by employers or self-employed persons during periods of their employment or other activity in the Russian Federation, and in some cases –

outside the country. The insurance period of an employee/self-employed person is equal to the length of period when the contributions were paid to the PFR. The insurance period can also include socially important periods when retirement contributions were not paid: military service by conscription; being a spouse of a serviceman on a mission where employment options are unavailable; taking care of an infant younger than 1.5 years (this rule applies to four children in a family); taking care of a first-category disabled person, a disabled child or a person older than 80; being in receipt of a benefit on account of short-term disability; being in receipt of an unemployment benefit; compulsory community service; imprisonment on account of unwarranted sentence; other (Federal Law No. 400-FZ Dated December 28, 2013).

## Sources of Retirement Contributions: Russian in the International Context

A pension system can have three main sources of financing: employees' contributions, employers' contributions, funds from the state budget. Practically, all pension systems in the world are financed by employees and/or employers (Table 1). Financing pensions, a state usually draws on the general taxes or, less often, the special taxes (for instance, excise duties). Unlike retirement contributions paid by employers or employees as a percentage of the latter's wages towards future pensions, the state's payments can be used to cover administrative costs and/or to cover a deficit in the pension system. Some nations abolished retirement contributions for low-paid employees, replacing them with payments from the state.

Rates of retirement contributions can be uniform for the entire employed population or differentiated depending on the wage amount. Usually retirement contribution rates are higher for the self-employed, "compensating" the contributions paid jointly by employees and employers. The contribution rates can vary depending on the type of pension systems. Some nations apply a single rate of insurance contributions not only for

Source: Collected by authors based on Social Security Programs Throughout the World: Europe (2014a), Asia and the Pacific (2014b), and The Americas (2015)

pension plans but also for family benefits, employment benefits, or disability benefits (Social Security Programs Throughout the World: Europe 2014a).

The total rates of retirement contributions paid by employers and/or employees significantly differ from one country to another: from 1.94% in Israel to 36% in Singapore. Russia, with its 22% (since 2012) or 26% (in 2011), is located approximately in the middle of the ranking, an equal to such countries as Estonia (22%), Norway (22.3%), Sweden (22.73%), Austria (22.8%), Finland (23.3%), Switzerland (23.8%), The Netherlands (24.2%), Slovenia (24.35%), France (24.75%), Lithuania (26.3%).

Russia is distinctive because employees in this country do not pay the contributions. Among the countries mentioned above only Australia has a similar scheme, with all retirement contributions paid by employers. There are also a number of countries (for instance, Belarus, Estonia, Mexico) where employees pay retirements contributions at a much smaller rate (1–2%) than employers. Overall, in most countries the rates of retirement contributions payable by employers are higher than those payable by employees. Equal rates for the employer and the employee are set in Switzerland, Malta, Germany, Japan, Canada, South Korea, and some other countries. The countries with the highest retirement contribution rates payable by employees are Singapore and Croatia (20%), The Netherlands (18.5%), Slovenia (15.5%). In Croatia, all contributions are paid by employees.

Retirement contribution rates for the self-employed vary even more (Table 2). As has been noted earlier, in Russia contributions from the self-employed practically do not correlate with the presence and amount of their revenues, and the fixed contribution amount is calculated on basis of the MROT. Similar schemes for retirement contributions of the self-employed, dependent on a minimal or median wage, are applied in China or Mexico. In most countries, the basic taxable income for the purposes of calculating retirement contributions is an individual entrepreneur's revenue, often with a cap. The rate of retirement contributions is differentiated

depending on the pension type (old-age pension, disability pension, survivor's pension) or on the pillar of the pension scheme (main/subsidiary/occupational, PAYG pension insurance or mandatory funded individual pension account). Romania and Chile have a special rate for covering administrative overhead. Overall, it can be said that in most countries rates of retirement contributions of the self-employed are higher than those paid by employees or their employers.

## Structure of Financing of Russian Pension System

Retirement contributions are a major source of the revenues of the Russian pension system. Prior to 2005, retirement contributions sufficed for paying the insurance part of pensions and the federal budget financed only uninsured periods and pensions not related to the retirement contributions (social pensions, state-provided pensions) (Fig. 1).

From 2005 onwards, when the UST's effective rate was significantly reduced, the need in state financing has been growing. An additional factor accounting for the PFR's deficit and, accordingly, the demand for transfers from the federal budget was the indexation of pensions in 2008–2010, which was greater than the limits set by law. In 2009, the amount of federal budget transfers became equal to the amount of retirement contributions paid towards the pension's insurance component. In 2010, after the so-called valorization of the pension rights accrued for the periods before 2002, and especially before 1991, had raised the amounts of pensions paid to most senior pensioners, the situation became even worse and the size of federal budget transfers exceeded the total amount of retirement contributions (to both the insurance and funded components) by 1.4. In 2011–2013, the size of federal budget transfer was comparable to the amount of retirement contributions towards the insurance component. In 2014–2015, due to the abolishment of contributions towards the funded part, the authorities managed to diminish the size of federal budget transfers. However, it still remains significant.

The fact that the amount of the federal budget transfer continues to be large is partially explained by the reduction of the retirement contribution rate to 22% in 2012 from the rate of 26% set for the previous year – 2011. The Federal Law No. 167-FZ Dated December 15, 2001, provides that the difference of 4 percentage points is temporary and should be compensated by the state. Besides, the law sets lower retirement contribution rates for certain categories of the employers or employees: agricultural producers meeting certain criteria; organizations and individual entrepreneurs applying the unified agricultural tax; the disabled of I, II, and III categories in organizations meeting certain criteria; organizations and individual entrepreneurs working in special economic zones, and many others (Federal Law No. 167-FZ Dated December 15, 2001).

**Retirement Contributions, Russia, Fig. 1** Dynamics of the amounts of retirement contributions paid to the PFR towards the insurance and funded components of the pension system and federal budget transfers to the PFR, 2003–2015. (Source: Calculated by authors on basis of the official information on the PFR budgets)

The deficit in the PFR and the growing need for federal budget transfers also stems from the increasing informal employment in Russia since the early 2000s. According to the most modest estimates of informal employment suggested by the data of the Rosstat's Labor Force Survey, the share of people employed in the informal sector grew from 13% in 1999 to 17–18% in 2009 (Gimpelson 2011). This means that the gap between the numbers of the employed (formally and informally) and the numbers of retirement contributors continues to grow.

Increases in the numbers of people formally employed would push up the numbers of the contributors and the amount of collected retirement contributions paid to the PFR, while keeping the numbers of pensioners at the same level. According to the prognostic estimates of Grishina and her colleagues (Grishina et al. 2014), if all wages become fully transparent (i.e., formal), the amount of retirement contributions will grow by 14.3–14.8%, which corresponds to 0.6–0.7 percentage points of the GDP. Such an increase in the amount of the insurance-component contributions to the PFR, with the replacement rate unchanged, would reduce the federal budget transfers by 18–24%.

## Conclusion

Russia has a defined-contribution system whereby the pension's benefit depends on the amount of contributions paid over the course of the working life. The retirement contribution rate is 22% of payroll now, which is on average level by the international standards.

One of the distinctive features of Russia's pension system is a lack of employees' contributions. Hence, pension benefits are financed by the employers' contributions and federal budget transfers. Only Australia as Russia has no employees' contributions; in most other developed countries, retirement contributions are paid both by employers and employees. The self-employed and individual entrepreneurs in Russia pay retirement contributions themselves. However, compared to some developed countries, the

self-employed taxpayers' retirement contributions are fairly low because they are calculated on the basis of the MROT instead of the entrepreneurial revenues like in most countries.

The state's inconsistent steps in setting retirement contribution rates and amounts for pension indexation, together with the absence of a source of financing for the transition to funded pensions, are the causes of the deficit in the PFR. As a result, a large part of the pension payments is financed through federal budget transfers. The dynamics of the amounts of the federal budget transfers to the PFR and retirement contributions reveal a serious deficit in Russia's pension system.

# Retirement Crisis: Global

Paul C. Trogen
East Tennessee State University, Johnson City, TN, USA

## Synonyms

Pension; Public pension; Social security

## Definition

*Retirement* is a time after a worker stops working, either due to illness, reaching a predetermined age, or personal choice – often because they have an adequate pension (Gillespie 2011).

*Pay-as-you-go (PAYG) retirement system* is a retirement plan where benefits to current retirees are paid by the retirement contributions of current workers.

*Fully funded retirement system* is a retirement plan where worker's contributions to the plan during their working years are sufficient to pay the scheduled benefits upon retirement.

## Introduction

The International Monetary Fund predicts that, before 2050, the social security system in each of the world's seven major industrialized nations will face a shortfall (Escamilla 1999). Each is a manifestation of a global retirement crisis. Inflows and outflows are symptoms and not the underlying problem. "Social security reforms" usually increase taxes and/or cut benefits, but the crisis reappears. For example, US Social Security was "fixed" in 1972. In 1977, it was "fixed" again, and President Jimmy Carter announced the Social Security would be solvent for 50 years (Carter 1977). In 1981, the system was again insolvent, and the Greenspan Commission made Social Security solvent for the next 75 years. Yet, by 2032, the Social Security Trust Fund will be exhausted, and Social Security will be able to pay only 75% of its obligations. Treating the symptoms, without curing the disease, doesn't resolve the problem.

Germany, the United States, China, and Japan are major world economies, yet each faces a retirement crisis. Germany is the largest economy in the European Union and the originator of universal retirement. The United States and China are the world's largest economies, the first trying multiple times to keep its retirement system solvent and the second struggling to establish it. Japan confronts an impossible combination of lower fertility and high life expectancy (Aaron 2014), which will soon be the whole world's fate.

## Retirement in a Historical Perspective

Universal retirement is a relatively recent social experiment introduced in Germany in 1889 (Social Security n.d.). The United States followed in 1935 (ibid). Japan launched its first national pension programs during WWII and extended universal coverage in 1947. While Chinese government employees have enjoyed pensions paid by the government, many other Chinese still wait for a universal coverage.

### Traditional Arrangements

Before retirement programs, traditional institutions, like extended families in multigenerational households, supported the elderly. Before China's Cultural Revolution, the norm of filial piety (Fong 2016:86) expected children to care for aging parents. Before China's collectivization of agriculture, economics reinforced this norm, as children honored their parents in hope of inheriting the farm from their parents. First, collectivization gave the land to the state. Later, capitalism caused 100 million young Chinese to leave the rural interior and aging parents to work in distant coastal factories (Longman 2004:56). Without the supportive economic and social milieu, China now struggles to reinstate the traditional values of caring for parents (Fong 2016:87) and in 1996 passed legislation requiring children to financially support aging parents (Fong 2016:150). Young Chinese often face the heavy 4-2-1 burden, where only one child bears responsibilities toward two parents and four grandparents.

### Germany, the First Social Security

In Germany, economic change also weakened the traditional social safety net. Transition from an agricultural society to an urban society removed the safety of farm and extended family. Germany's industrial revolution transformed her from a rural society to the largest industrial power on the European mainland. Cities grew. Between 1820 and 1900, the population of Essen grew from 100,000 to 400,000, Hamburg from 127,000 to 721,000, and Berlin from 200,000 to 1,888,000). Chancellor Otto von Bismarck instituted social programs to secure working class support and instituted Social Security in 1889. The German retirement age was originally set at 70 (Social Security n.d.) when life expectancy in Germany was 37.17 years for men and 43.97 years for women (Twarog 1997). Among those Germans reaching age 65, life expectancy was 70 (ibid). The German retirement age was reduced to 65 in 1916 to match that of public pensions (Social Security n.d.).

### US Social Security

The United States did not immediately follow Germany's lead. At the turn of the century, few Americans thought about retirement. The US population was still 60% rural; few workers had any kind of pension, and people worked as long as they were able. By 1930, however, two changes undercut the safety net. First, by 1930, a majority of Americans lived in urban areas away from farm and extended family. Second, the Great Depression occurred. The aim of Social Security, as of many New Deal Programs, was to provide some modest assistance. Social Security originally provided only 25% of preretirement income.

### Japan

Pensions also emerged in Japan during crisis. During WWII, many sons went off to war. The first pension system for workers was established in 1941 (Ministry of Foreign Affairs (MOFA), n.d.). In 1944, a disability pension program was established, based not on the recipient's ability to work, but upon the ability to perform activities of daily living (Oshio and Shimizutani 2012). Universal social security was extended to all Japanese people in 1947 (MOFA n.d.).

### China

China's retirement pension system is still under construction. In the revolutionary fervor of the 1950s, Mao promised workers in state-run enterprises the "iron rice bowl," in which, in exchange for low wages, workers were promised generous pension benefits. No money, however, was actually set aside for this purpose, creating huge legacy costs (Longman 2004:55). China provided generous pensions for civil servants, paid by the government. China didn't create a retirement system until 2000. It covers only 365 million citizens, and it is already underfunded in an amount equal to 150% of GDP. (Last 2013:135). Pensions have yet to reach the countryside (Longman 2004:56) where three quarters are not covered (Fong 2016:152). One fourth of Chinese retirees live on less than one dollar a day (Fong 2016:141).

Pensions for private enterprise employees are less generous and must be purchased by workers, which is perceived as inequitable. In 1997, China took the advice of the World Bank and created individual retirement accounts for younger workers, similar to 401Ks in the United States. In practice, however, contributions are merely bookkeeping entries and do not buy real investments in the economy. Local social security bureaus use the contributions to pay benefits to current retirees (Longman 2004:56). These accounts become just another unfunded liability. Chinese workers saving for retirement have few investment options. They can either invest in China's illiquid stock market, or put money into an insolvent banking system that offers returns below inflation (ibid).

## The Operation of Retirement Systems

Retirement system structure determines its sensitivity to uncertainty and change. There are two major types of retirement systems, fully funded and pay-as-you-go. Most developed countries operate their retirement systems on a pay-as-you-go basis, and they face growing financial burdens (Gruger and Wise 2000).

A ***fully funded*** retirement system is more stable because it theoretically collects all the funds needed to pay for retirement during a wage-earner's career. We say theoretically, because fully funded plans also partially depend upon additional interest earned on retirement contributions to keep up with inflation and help accumulate funds to pay the benefits. These plans are really actuarially funded, because retirement benefits should be available upon retirement based on actuarial assumptions, including how long wage earners contribute to the plan, projected contributions (based on projected wages), prevailing interest rates, and how long retirees are expected to draw benefits. The Great Recession of 2008 demonstrated that unanticipated events can upset actuarial assumptions. The recession reduced wage levels, prompted central banks to reduce interest rates, cut careers short by forcing laid-off workers to take early retirement, and delayed the onset of work when competition for scarce jobs forced young people to seek more years of education. The Great Recession has put some "fully funded" US

municipal government pension systems, including that of Detroit, deep into debt (Trogen 2015).

The first national social security system in Germany was originally fully funded. The loss of half the plan's assets resulting from Germany's loss in two world wars and hyperinflation forced the plan to convert to a pay-as-you-go system in 1957 (Börsch-Supan and Jürges 2012). The 1935 US Social Security Act also originally attempted to accumulate significant reserves in by phasing in rising payroll tax deductions years before the first retirement checks were to be paid in 1942 (Martin and Weaver 2005). But politics soon reduced US Social Security to a purely pay-as-you-go system when Congress delayed payroll tax increases, then moved up, and expanded benefits. The first person to receive social monthly security benefits, Ida May Fuller, received her first of many checks in January 1940. She collected $22,888.92 in benefits during her retirement, after paying only $24.75 into the system (Social Security History n.d.). Social Security soon lost any illusion of being actuarially sound.

The alternative to a fully funded system is a pay-as-you-go system. In a *pay-as-you-go* system, payroll deductions of current wage earners are not saved for their own retirement, but are used to pay the benefits of current retirees. A pay-as-you-go system is essentially a gift from future generations to the current generation. This arrangement did not appear as risky in 1935 as it sounds today, because people in 1935 assumed future generations would always be larger. Today, that is no longer true.

Today, the retirement system of all major industrial countries operates on a pay-as-you-go basis (Escamilla 1999). Pay-as-you-go systems need a stable or growing ratio of workers to retirees. That ratio is falling to unsustainable levels in most major economies. Causes of declining ratio include:

- A permanent reduction in workers due to sub-replacement level fertility levels.
- A permanent increase in the number of retirees due to longer life expectancy.
- Delays entering the workforce due to higher educational attainment.
- A temporary increase in the number of retirees between 2016 and 2050, when baby boomers swell retirement rolls.

Demographics are no longer favorable for pay-as-you-go retirement systems.

## Changing Demographics

> German chancellor Konrad Adenauer once said Germany could afford generous unfunded pensions because Germans women will always have babies. He should not have taken German women for granted. (Longman 2004:50)

Declining fertility is a long-term trend. Sub-replacement rate fertility is becoming the new "normal." Both are fatal for pay-as-you-go retirement systems.

Studies in 1935, when the US Social Security system was developed, suggested that the system would be self-sustaining with a modest level of payroll taxation if the retirement age was set at 65 (Social Security age 65). At that time, US life expectancy was 61.7 years (Williams 2013), although a significant number were still expected to live beyond 65. There were 37 workers for each anticipated retiree in 1935 (Escamilla 1999). But demographics change. By 1999, there were only three workers per retiree, and when the last baby boomers hit retirement age, there will be only two workers per retiree (ibid). Two demographic transitions explain falling birthrates.

### The First Demographic Transition

The first demographic transition causes graying of the population. When mortality was high, women compensated by bearing more children. When health conditions improved, more children survived, creating a boom generation (Bloom and Canning 2004). The *first demographic transition* occurs when mothers gradually realize more children were surviving. They gradually reduced their childbearing toward the replacement rate (Last 2013:92). There are fewer children. Within two generations, there are also more old people, because life expectancy increases in the elderly due to reduced exposure to disease as children and

young adults (Longman 2004:106). The population may still grow, but growth is due to more senior citizens.

### The Second Demographic Transition

The second demographic transition is a decline in the number of children women desire due to urbanization. Fewer children cause a population free-fall. When people supported themselves by agriculture or a cottage industry, children were an asset. Children made families better off because they helped on the farm or the shop and produced more than they consumed. When the industrial revolution arrived, workers took factory jobs in cities. In crowded cities, children were not an asset, but an impediment to economic mobility (Longman 2004:137). Cities always had lower fertility (Last 2013:18). The second demographic transition causes people to desire fewer children. America's industrial revolution began around 1800. US fertility rates continued to fall almost without interruption since 1810. The interruption was the baby boom, which peaked in 1957, after which fertility rates returned to their long-term downward trend (Longman 2004:87).

Urbanization also causes fertility to fall globally. Global fertility rates are now half of what they were in 1972 (Longman 2004:8). Almost every country in every part of the world has declining fertility (Last 2013:8). Only 3% of the world's population lives in countries where the birthrate is not declining (Morgan and Taylor 2006). Fertility continues to fall past the replacement rate (Last 2013:92). The theory of the second demographic transition suggests that sub-replacement fertility will be "structural and permanent" (Last 2013: 94). All first world countries are below the 2.1 replacement fertility rate (Last 2013:8). No industrialized nation produces enough children to sustain its population, or to prevent rapid population aging (ibid).

### The Baby Boom as Temporary Anomaly

The baby boom is a temporary response to one-time events and did not reverse the overall decline in fertility. Some of the baby boom in Europe and the United States may be an echo effect of the baby boom that occurred after 1918 in response to casualties in WWI and high mortality rates in the 1918–1919 influenza epidemic. The baby boom also includes children postponed during the Great Depression and WWII (Bloom and Canning 2004). Birthrates increased all over the world after WWII, and population grew rapidly (Arentz 2015).

### Back to Declining Fertility

After the baby boom, birthrates resumed their downward trajectory. Japan experienced a baby boom from 1946 to 1951, after which its birthrate fell by half (Arentz 2015). Fertility dropped in every industrialized nation between 1960 and 1980, in the Netherlands from 3.1 to 1.6, in Canada from 3.8 to 1.8, in West Germany from 2.3 to 1.5, and in the United States from 3.7 to 1.8 (Last 2013:15).

### Exceptions to the Rule: Developing Nations

Few areas have avoided the demographic freefall. In most countries in sub-Saharan Africa, children are still seen as a source of labor and old age insurance, so traditional high fertility rates persist despite improvements in child mortality (Bloom and Canning 2004). Yet birthrates are declining even in sub-Saharan Africa (Longman 2004:25). When birthrates do drop, they fall faster than they did in developed countries, due to higher female educational attainment, job opportunities, and access to family planning (Bloom and Canning 2004). Whereas the developed world had similar proportions of young and older persons by 1990, developing counties are expected to have similar proportions by 2030 (Goulding and Rogers 2003). By 2050, according to UN projections, 75% of countries, including developing regions, will reproduce at below replacement levels (Longman 2004:26).

### The New Normal

Below replacement fertility is the new normal. "There is no reason to think fertility will rise above replacement level. No country has risen to above replacement level for a 5 year period after falling below it" (Last 2013:24). Low fertility reshapes a population structure, with more adults, and eventually more retirees, than children (Last

2013:26). Retirement systems can no longer rely on growing generations of new workers to bail them out.

## Attempts to "Reform" Social Security

Below replacement fertility assures number of new contributors to retirement systems will decline. Longer life expectancy increases the number of retirees. Neither trend is likely to change and neither is favorable for retirement systems. "Social security reform" rarely addresses this demographic imbalance and instead usually treats the symptoms, sometimes by trimming benefits, more often by raising social security taxes, and rarely by delaying benefits.

### Cutting Benefits

Cutting benefits is the path less followed because large numbers of elderly voters make it politically perilous. Even in China, where voters have less clout, attempts to not pay promised benefits were met with protests and riots in Liaoyang and Daqing in 2002 (Longman 2004:55). Reductions planned to balance cash flow models are usually expediently delayed into the future, where current voters are less likely to notice them. Reductions sufficient to offset demographic trends, however, would leave retirees destitute. Germany and Japan already have to supplement insufficient social security revenues with general revenues (Escamilla 1999). Japan, which faces tomorrow's demography today, is reducing pension benefits by 0.9% per year for new retirees until 2023 (OECD 2011).

### Increase Social Security Payroll Taxes

A common recommendation is to increase the tax rate on workers (Aaron 2014). While raising payroll taxes can temporarily alleviate the symptoms, it still does not touch the underlying problem. Trying to compensate for demographic trends by raising payroll taxes would eventually raise them to an unsustainable level. Social Security and Medicare taxes in the United States total 15.3% (6.2% Social Security tax and 1.45 Medicare tax percent on both employer and employee). By 2030, a payroll tax of 28.25 may be necessary to cover Social Security and Medicare (Longman 2004:81). According to estimates of the Congressional budget office, the three big entitlement programs (Social Security, Medicare, Medicaid), plus interest on the debt, could consume 24% of GDP by 2030. By 2050, their cost could rise to 47% of GDP, which is more than double expected revenues at that time (Longman 2004: 21). One cannot raise taxes enough to overcome demographics.

Raising payroll taxes may actually exacerbate the underlying problem by making harder for workers to afford children. When governments raise payroll taxes, young people, in order to afford those taxes, postpone starting a family and seek out higher levels of education, interrupting their prime childbearing years (Longman 2004:21). College delays marriage and childbearing (Last 2013:163). The long-term effect of raising payroll taxes is declining fertility (Longman 2004:22), creating a need for higher taxes, which creates a downward demographic spiral.

### Smoke, Mirrors, and Retirement System Projections

Retirement funding projections are based on assumptions, often assuming historic fertility rates and economic growth. But declining populations cause economies to slow. "There is no precedent in human history for economic growth on declining human capital" (Last 2013:36). "[T]he pace of human progress has slowed considerably since 1972 – just after western fertility began to collapse" (Last 2013:27). Today's economic growth is unsustainable, because it consumes more human capital than it produces (Longman 2004:134).

### Delaying Retirement

> Social security was conceived in an era of high fertility. . . [A]fter our fertility collapsed, these programs became dysfunctional." (Last 2013:109)

There are only two possibilities, to adjust our demographics to our programs, or adjust our programs to our demographic realities. Demographics are resistant to change. Fertility has a

turning radius of a battleship, not a go-kart (Last 2013:156). The number of senior citizens has temporarily grown because of the baby boom, but will permanently grow due to increasing life expectancies.

Remaining life expectancy at age 65

| | Women | | | Men | | |
|---|---|---|---|---|---|---|
| | 1960 | 2011 | Change | 1960 | 2011 | Change |
| Japan | 14.1 | 23.7 | 9.6 | 11.6 | 18.7 | 7.1 |
| Germany | 14.2 | 21.2 | 7.0 | 12.2 | 18.2 | 6.0 |
| United States | 15.8 | 20.4 | 4.6 | 12.8 | 17.8 | 5.0 |
| China | – | 16.9 | – | – | 14.8 | – |

Data Source excluding China, OECD 2013. Data Source China: World Health Organization 2015
China's current life expectancy is 74, a gain since 39 at the time of WWII (Fong 2016:241)

The duration over which retirement benefits are collected has increased dramatically. When public pension systems were established, if people survived to retirement age, they had a few short years of retirement (OECD 2011). Today, male in OECD countries has an 80% chance of reaching 65 and a woman a 90% chance. Life expectancy at 65 is 17 years for a man and 21 years for a woman (ibid). More people are collecting retirement benefits for a much longer time.

The ratio of young to old, which we cannot change, does not matter to retirement systems nearly as much as the ratio of active workers to retirees, which we can change. If a person at 75 is a healthy as a 65 year old was a generation earlier, we could postpone retirement 10 years and have no problem funding retirement (Longman 2004:179). The appropriate retirement age is not divinely ordained. The retirement age in the original German Social Security was 70. The 65-year retirement age was spread by diffusion. First, Germany's retirement age was reduced to 65 to match the pensions for German civil servants (Social Security n.d.) from where it was copied by the United States, then by Japan, and soon in China.

Increases in the retirement age for future retirees are also copied by diffusion, not calculation. The 1983 revisions to the US Social Security act gradually raised age at which one could collect full retirement benefits from 65 to 67 by the year 2027 (Attaraian 2003; Pattison 2015:21). Germany is also gradually raising the retirement age from 65 to 67 over the years 2012–2030 (Vogt and Althammer 2016). China also adopted gradual retirement age increases. The 13th Five-Year Plan (2015) will gradually increase the retirement age to 65 by 2045. Female public servants previously retired at 50 and males at 55. Men in nongovernment jobs retired at 60, women in white-collar jobs at 55, and women in blue-collar jobs at 50 (Asia Times 2016). The retirement age recently increased to 65 for men, 60 for women (Golley 2017).

The retirement age is important as it is seen as prescriptive or "normal", rather than permissive. In 2012, labor force participation of men over 65 in Germany was only 7.1%, 23.6% in the United States, and 28.6% in Japan (Aaron 2014). The full retirement age is only part of the problem, as a majority retires before 65.

The onset of retirement is also strongly influenced by when benefits are first available (Gruger and Wise 2000:7). In Germany, there are many ways to retire. All are eligible to retire at age 65, but few work that long. A large fraction retires under a disability program before age 60. Others retire under a social security disability program after 60. Some retire under a social security unemployment program at age 60. Still others use the flexible retirement plan, which allows people with long service (45 years) to retire at age 63 (Gruber and Wise, 2000:14). In Germany, the most popular retirement age is 63, when flexible early retirement becomes available. The second most popular is the normal retirement age of 65, followed by age 60, when older disability and unemployment benefits become available (Gruber and Wise 2000:19).

In the United States, more people retire at age 62 when early retirement becomes available than age 65, the full retirement date. The third most popular age is 68 (Gruger and Wise 2000:17).

How long people work is closely related to the incentives in social security plans (Gruger and Wise 2000:2). Many retirement systems create an incentive to leave the workforce early

(Milligan and Wise 2012:1). Retirement-aged people are reluctant to continue working if the incentives to do so are not actuarially fair because the gains in wages are offset by decreases in future retirement benefits (Gruger and Wise 2000:6). In the United States, social security checks are twice as high if one retires at 70 than at 62. However, since the 1983 amendments to the Social Security Act, half of social security checks are taxable for those with single tax returns over $25,000, or joint returns over $32,000 (Attaraian 2003), figures retirees are more likely to reach with delayed retirement. After factoring taxes and inflation, even if one were absolutely guaranteed to live until their 78th birthday, the present value of benefits may be higher when one retires at 62. US life expectancy at birth is only 78.7 years (World Bank). People may be responding rationally to the incentives by retiring early.

Senior citizens can play a big role in saving social security systems. There are two suggestions for automatic adjustments of retirement systems to life expectancy (Vogt and Althammer 2016). The first is to adjust the retirement age up the full amount of increases in life expectancy at age 65. Under such a scenario, over the last 50 years, the retirement age would have been adjusted upward by about 7 years, rather than the two policy makers phasing in, in order to keep the number of retirement years stable. The second option is to adjust the retirement age to keep the ratio of work years and retirement years constant. If 50 years ago a worker worked 45 years, and retired for 15, that's a 3:1 ratio. Using a 3:1 ratio, over the last 50 years, the retirement age would increase about 4 years 8 months. The crucial ratio for retirement system is not young person per senior citizen, but worker per retiree. We can have both longer lives and more active workers.

## Conclusion

Below replacement rate fertility and increasing life expectancy create a retirement crisis. One can still save social security systems by improve the ratio of workers to retirees. First, the retirement age could be more accurately adjusted to reflect improvements in life expectancy. Second, incentives could be corrected to de-incentivize early retirement and reward working to or beyond full retirement age. Third, by rebalancing the ratio of workers to retirees, we could avoid heavy payroll taxes that might discourage workers who want to start a family from raising the next generation of workers.

# Retirement Crisis: USA

Paul C. Trogen
East Tennessee State University, Johnson City, TN, USA

## Synonyms

Pension; Public pension; Social security

## Definition

*Retirement* is the time after a worker stops working, because of reaching a predetermined age or personal choice – often influenced by having an adequate pension (Gillespie 2011).

## Introduction

Paychecks end upon retirement, but living expenses continue. Today's retirees face a growing danger of out-living their retirement funds. A retirement crisis occurs whenever the inflow of money into a retirement system fails to match its obligation to retirees. The three largest sources of funds for retirement are Social Security, pensions, and private assets (Gitman and Joehnk 2002:610). Today, each of these sources faces shortfalls.

Promises to retirees once appeared easy to keep. Growing populations supplied expanding generations of workers who paid more into retirement systems than retirees withdrew from them. Both productivity and wages grew, providing funds to support both retired generations and a consumer-driven economy. Interest rates were high enough to turn affordable monthly contributions into healthy pension funds and personal savings accounts. Demographics and economics worked together to deliver a stable flow of retirement funds to retirees. All this has changed.

## Retirement System Mechanics

Retirement systems require cash inflows to make payments to retirees possible. Systems differ both in how they calculate their obligation to retirees and how they fund it.

### Defined Benefit or Defined Contribution?

Retirement plans promise workers payments in retirement. In a *defined benefit plan*, the monthly payment to retirees is defined in advance. In a *defined contribution plan*, only the monthly contribution made to the retirement plan during employment is defined.

Older retirement plans and public employee pensions usually defined the benefit the retiree is guaranteed upon retirement. In a *defined benefit plan*, the employer bears the responsibility to set aside enough funds and to invest them wisely, to pay the promised benefit. A retirement plan that once appeared sufficient to pay all promised benefits, assuming normal returns on investments, could run out of funds if investments perform below expectations.

After the Great Recession, anemic attempts at recovery, and disappointing returns on both savings and investments, employers sought ways to avoid responsibility for unfavorable financial market returns. So later retirement plans tend to have a defined contribution. In a *defined contribution plan*, the employer and/or employee contributes a defined amount into the investment (s) chosen by the employee from a menu of options. While the employer relinquishes the ability to delay contributions to the plan, the employer also relinquishes responsibility for the market returns on investments. Upon retirement, the employee's account is usually used to purchase an annuity which will provide lifetime retirement checks to the new retiree.

### Fully Funded or Pay as You Go (PAYG)?

Retirement plans will either fund benefits during the employee's working years or wait to fund them upon their retirement. In a *fully funded* retirement system, all the contributions needed to pay an employee's future benefits are made during the employee's working years. Defined contribution plans are, by definition, fully funded, as the only legal obligation is to make the scheduled contributions.

The first national Social Security System, set up in Germany in 1889, was fully funded. Enough money was set aside, when compounded with expected returns from investments, to pay promised retirement benefits. Unfortunately, the loss in two world wars and hyperinflation caused the fund to lose half its assets, forcing it to become a pay-as-you-go system in 1957 (Börsch-Supan and Jürges 2012).

The alternative to a fully funded system is a pay-as-you-go system. *Pay-as-you-go* (PAYG) systems depend upon the retirement contributions of current workers to pay the retirement benefits of current retirees. Social Security, like all US federal government retirement systems, operates as a pay-as-you-go system. Since retirement contributions must at least equal retirement benefits for the system to remain solvent, the long-term viability of a pay-as-you-go system is dependent upon a steady or increasing stream of retirement contributions.

## Retirement System Dynamics: The Perfect Storm

Actuarial assumptions, such as expected future interest rates and the number of workers paying into the system, have all changed in unfavorable directions. The largest generation in all of human history, the baby boom generation, is retiring.

Succeeding generations are smaller. Furthermore, the labor participation rate among that shrinking pool of potential workers is the lowest in four decades, leaving fewer people paying into retirement systems. The Great Recession also left workers with declining real wages, so workers contribute less than anticipated to their retirement plans. The Great Recession also wiped out part of the investments upon which both pensions and individual retirement accounts relied to fund retirement. Low interest rates, which were designed to stimulate the economy, made it harder for retirement systems and individuals to rebuild their retirement savings after losses during the Great Recession.

### Demographics

The long-term viability of Social Security Systems depends on each succeeding generation being larger than the preceding ones (Longman 2004). When Social Security was instituted in 1935, there were 37 workers for each retiree (Escamilla 1999). The ratio of workers to retirees was 16:1 in 1983, when Social Security was last overhauled (Bernstein 2005). The number of workers supporting each retiree had fallen to 3:1 by 1999 (Escamilla 1999), and the ratio will be 2:1 when the last baby boomers hit full retirement age in 2031 (Bernstein 2005). These demographic trends are extremely unfavorable for any pay-as-you-go system.

### Labor Force Participation Rate

Compounding the problem of a shrinking working age population is a declining labor participation rate. "The percentage of adult Americans working or actively looking for work stands at 62.6 percent, the lowest level in nearly four decades" (Soergel 2015). Workforce participation statistics fell faster during and after the Great Recession than at any time in US history (ibid). Three factors suppress labor force participation. First, people are staying in school longer; 52% more are enrolled in post-secondary degrees in 2014 than in 1990 (ibid). Second, disability insurance claims increase when jobs are scarce. Between 2007 and 2015, the number of people receiving Social Security disability benefits has increased 25.46% (Social Security Disability 2016), while the labor force only increased 2.53% (Bureau of Labor Statistics 2016). Third, recessions also cause unemployed older workers to stop looking for work if they have reached the early retirement age of 62. Half of the 63-year-olds are no longer in the labor force (Soergel 2015). Early retirement not only reduces the number of contributors to Social Security and pensions, it also increases the number receiving benefits.

### Stagnant Payrolls

Recessions undermined the expectation that rising payrolls would help fund retirement plans. The Great Recession, which began in 2008, is the greatest economic catastrophe since the Great Depression. Personal incomes are taking far longer than after previous recessions to recover to pre-recession levels. Seventy-two percent of Americans believe we are still in the middle of the Great Recession (Coy 2015). Real wages have been in decline since 2009 (Ford 2016). Real median household income is 25% lower today than in 2007 (Spittler 2016). Social Security payroll taxes, which in 1983 were projected to exceed benefits until 2016, fell below benefits by 2010 because of the recession (Pattison 2015, p. 4).

### Depressed Interest Rates and Investment Returns

The Federal Reserve has held interest rates near zero since the onset of the Great Recession in an unsuccessful attempt to encourage borrowing and spending (Spittler 2016). Federal Reserve Chairman Janet Yellen says the economy can't bear higher interest rates (Hilsenrath and Davidson 2016). Even without Fed policy, demographics alone might depress interest rates. While baby boomers spent during their younger years, they now tend to conserve and save for retirement. Increased propensity to save creates a growing pool of savings available for loans. But reduced spending also reduces demand for loans. Reduced consumption among aging baby boomers reduces the demand for production and need for firms to borrow and invest. As a society ages, the growing supply of savings, combined with a lower demand

for loans, naturally contributes to falling interest rates. Ironically, low interest rates occur at the exact time when the aging population needs low-risk, dependable streams of income for retirement.

### Longer Life Expectancy

A man reaching age 65 in 1940 could expect to live 12.7 more years (Social Security History n.d.). A 65-year-old man in 2016 can expect to live 19.3 years and a woman 21.6 years (Social Security 2016). Due to longer retirements, retirees will collect Social Security and pension payments over more years, and personal savings will have to last longer.

## Social Security Crisis

Social Security is the largest source of retirement income (Gitman and Joehnk 2002: 610). Social Security has run short of cash multiple times because elected officials promised benefits but did not raise taxes to pay for them. This politically expedient but economically unworkable combination shifts financial burdens onto future generations. Burdening future generations once worked back when succeeding generations were larger and able to pay. Succeeding generations, however, are no longer larger nor are they more able to pay.

Universal retirement is a relatively recent invention, made possible by Social Security. Germany was the first country to introduce a social security system in 1889 (Social Security, Age 65). The German retirement age was originally set at 70 (ibid) compared to the life expectancy in Germany which was 37.17 years for men and 43.97 years for women (Twarog 1997). The German retirement age was reduced to 65 in 1916 to match that of German public pensions (Social Security Age 65). The plan was originally fully funded.

### Social Security Act of 1935

The United States passed the Social Security Act of 1935 as social insurance, with the retirement age set at 65, copied from the German model (Social Security Administration n.d.). The plan blended political expediency with attempts to make the system solvent. The initial payroll tax was a modest 2% of the first $3000 of income, half to be paid by the individual and the other half by the employer (Martin and Weaver 2005). The tax was scheduled to gradually increase, but not before 1940, and it would plateau at 6% in 1949 (ibid). While some contributions were delayed, so were retirement benefits, which were not scheduled to begin until 1942, which allowed Social Security to accumulate a reserve (ibid). In 1935 US life expectancy had increased to a new high of 61.7 years (Williams 2013). Studies at that time showed using 65 as the retirement age would make the system self-sustaining using only a modest level of payroll taxation (Social Security Administration n.d.).

### Amendments to Social Security Act, 1939

Features of the 1935 Social Security Act which contributed to the long-term solvency of Social Security soon fell victim to short-term political expediency. In 1939, one year before the first scheduled payroll tax increase, a revision to the Social Security Act postponed the payroll tax increase. Amendments in subsequent years further postponed any increase until 1950, when it rose to only 3% (Martin and Weaver 2005), rather than the original 6%. This change prevented the accumulation of reserves envisioned in the 1935 Act. The 1939 revision also moved up retirement benefits to 1940 (ibid). Benefits were also extended to dependents and surviving spouses (ibid). Without adequate reserves, Social Security became a purely pay-as-you-go system.

The 1939 amendments also made Social Security stand-alone financially. The 1939 Act converted reserves into a trust fund. Payroll taxes flowed directly into the trust fund, any unused reserves were invested in interest bearing Treasury securities (Pattison 2015), and Social Security payments were to be paid directly out of the trust fund. The trust fund more closely resembles a checking account rather than a savings account. The deposits made by workers are not saved for their own retirement, but pay benefits for current retirees (Mofitt 2015). American workers are, in effect, purchasing mandatory insurance to protect against death, disability,

health problems, or retirement (Keown 2001:504).

After 1939, any illusion of actuarially sound funding vanished. The first beneficiary to receive monthly Social Security benefits was Ida May Fuller. She filed for Social Security benefits at age 65 in November 1939, after paying into the program for a little less than 3 years. The first monthly retirement check, number 000–000-001, was sent to her on January 31, 1940, in the amount of $22.54 (Social Security History n.d.). She lived to be 100 years old and collected $22,888.92 in benefits (SSA n.d.). Her payroll tax contributions totaled $24.75.

### Expansion in the 1950s and 1960s

Program costs increased in the 1950s and 1960s. During the 1940s, the cost of living increased 72%. In 1950 benefits increased an average of 77%, yet the payroll tax only increased from 2 to 3% (Martin and Weaver 2005). The following decade saw three more benefit increases, and the payroll tax increased to a combined 5% of the first $4800 (ibid). Disability insurance was added in 1957, and Medicare was introduced in 1965. By the end of the 1960s, the payroll tax had risen to a combined 8.4% on the first $7800 of income (ibid).

### 1972 Amendments to Social Security

In the 1970s, both inflation and unemployment rose at the same time in a phenomenon called stagflation. Benefits were increased 15% in January 1970, 10% in January 1971, and 20% in 1972 (Martin and Weaver 2005). Automatic cost of living adjustments were instituted, to prevent the temptation of Congress to legislate overly generous increases (ibid). Yet the formula also overcompensated for inflation (Attaraian 2003). In 1972 a payroll tax increase was scheduled far off in 2010, when baby boomers would begin to retire (Pattison 2015:20).

### 1977 Amendments to Social Security

Rising benefits and economic stagnation exacted a heavy toll on Social Security. Between 1970 and 1982, Social Security costs rose from 3% of gross domestic product to 5% (Martin and Weaver 2005). With economic stagnation, payroll tax revenues did not keep up. In 1977 amendments to the Social Security Act corrected the overly generous automatic cost of living adjustments (Attaraian 2003). The tax increase scheduled for 2010 in the 1972 bill was moved forward 20 years to 1990, which was still far in the future, and set the final rate to its current 12.4% (Pattison 2015: 20). President Jimmy Carter said the revisions would save Social Security for 75 years (Longman 2004: 114).

### 1983 Social Security Reforms

A couple years after the 1977 amendments, Social Security was again in deep trouble. In 1979, a recession caused a trust fund deficit of almost 2 billion, and by 1985 it appeared that the trust fund would be exhausted (Attaraian 2003). In 1981, a bipartisan commission was established with economist Alan Greenspan as chair (ibid).

The 1983 reform accelerated the steps of payroll tax increases in the 1977 Act to begin in 1984 (Pattison 2015:21). Furthermore, half of the Social Security benefits would also be taxable for those with adjusted gross incomes of $25,000 for single returns and 32,000 for joint returns (Attaraian 2003). Congress gradually increased the age of full retirement benefits from 65 to 67 (Pattison 2015:21) by 2027 (Attaraian 2003). The benefit for those retiring early at age 62 was trimmed to 80% in 1983, 75% in 2009, and then 70% in 2027. Sacrifices were still politically expedient as they were light on current beneficiaries and taxpayers and fell most heavily on future taxpayers and beneficiaries (ibid).

The 1983 legislation pre-funded more of the costs of the retirement of baby boomers (Van de Water 2014). Social Security invests the surplus of payroll taxes over current benefits in US Treasury securities (ibid). The interest rate on trust fund securities, which is tied to the interest rate on Treasury securities (Pattison 2015:19), earned an interest rate of 3.8% in 2013 and was projected to earn 99 billion of interest income in 2014 (Van de Water 2014).

The 1983 reforms projected positive trust fund reserves for 75 years (Attaraian 2003, Pattison 2015:21) or 2058, a decade beyond the life

expectancy of the last baby boomers. The trust fund, which was projected to grow to 25% of GDP, peaked at only 18% (Pattison 2015:21). Current projections suggest that by 2033, the Old-Age and Survivors Insurance (OASI) trust fund will be exhausted, at which time the Social Security payroll tax would only allow Social Security to pay about three quarters of retiree's scheduled benefits (Van de Water 2014). "A sustainable solvency in the 1983 projections could have been achieved with. .. higher taxes or lower benefits" (Pattison 2015:21). "As currently projected, the decline in reserves toward depletion would be too rapid to be remedied by measures similar to those taken in 1983" (Pattison 2015:20).

Since 1939, Social Security collected enough payroll taxes to cover benefits, under favorable actuarial assumptions. But as 1972, 1977, 1983, and our current crisis show, Social Security has not accumulated enough reserves to withstand any deviation from those assumptions.

## Pensions in Crisis

One third of US retirees are covered by a pension (Ford 2016). The median state or local government pension pays $20,276 a year, and the median private pension is $8612 a year (ibid) (http://www.newsmax.com/Finance/StreetTalk/Malanga-chicken-pension-funds/2015/06/17/id/651072/).

### Public Pensions

Most public pensions are defined benefit plans. Since defined benefit plans do not specify the annual pension contributions, underfunding retirement plans is one of the few loopholes state and local governments have from balance budget requirements. Once unfunded pension liabilities accumulate, it becomes difficult to convert to a defined contribution plan.

US state and local government pensions operate under the loosest accounting standards in the world and set aside less cash per dollar of promised benefits than do public employee pension systems in the Organisation for Economic Co-operation and Development (OECD) countries (McGuire 2016). Dutch, Swedish, and French plans set aside twice as much per dollar of promised benefits (Ibid). A 1980 study found that less than 5% of state and local government pension plans were fully funded, and on average half the benefits were funded, but 23% of state plans were not funded at all, and federal pensions are all pay as you go (Reed and Swain 1990:284). States and local governments have a 1.5 trillion dollars unfunded pension liabilities, which could grow to 4 trillion if investment returns fall short of their estimates (Weil 2015). Arguments in favor of using a pay-as-you-go, rather than an actuarially funded, system are that governments are permanent entities and can always rely on taxation to cover the cost of pensions (Reed and Swain 1990:284). But pay-as-you-go systems also create a temptation to offer promise to workers politically popular benefits without levying the taxes to pay for them (Weil 2015). Assumptions that growth will make unaffordable promises more affordable in the future are reckless in today's economy. For example, in 1960, Detroit was prosperous with the highest per capita income in the USA, yet by 2010 it was poor with one of the highest unemployment rates (Trogen 2015). Detroit's population also fell from 2.8 million in 1950 to 700,000 today, making it a medium-sized city with big city pension obligations (ibid). Pensions and retirement obligations represented half of Detroit's 18 billion dollar debt when it filed for bankruptcy (ibid).

The public pension plans of America's 50 largest cities are underfunded by $382 billion, or $14,000 per household. And twenty of those cities are unlikely to be able to pay promised benefits after 2025 (Novy-Marx and Rauh 2011). Three common problems cause underfunded pensions. The first is lower than expected returns on investments. Long-term public pension returns are heading to record lows (Martin 2016). Detroit officials assumed its pension was fully funded, until returns on investments fell. Los Angeles' actual return of about 5% fell short of its estimated

7.75% return, creating a 15 billion dollar unfunded pension liability (Trogen 2015). A second cause of underfunding is the fall of investment values during the Great Recession. Prior to 2008, 60% of public pensions were funded at 80% of liabilities, which is considered safe. After the market collapse, only a third was funded to that level (Ellman and Merrett 2010). The third reason is a conscious decision to make smaller contributions than are necessary to fully fund the liability, transferring the cost to future generations.

### Private Pensions

Older private pensions often have defined benefits and suffer from the same weaknesses as public plans. While defined benefit plans promise a stable, predictable retirement income, their own survival is uncertain. Temptations of employers to overestimate investment returns, under estimate needed contributions, and to rely upon growing numbers of participants to cover shortages can undermine private pensions. For example, Central States Pension Fund that covers 400,000 teamsters, workers, and retirees assumes an overly generous 7.5% return on investments and is paying out $3.46 for each dollar coming in (Anonymous 2016). Due to aging demographics and employers leaving the system, the plan is insolvent (ibid).

Defined contribution plans also entail risk. Most new private retirement plans have defined contributions, which shifts the risk of poor investment returns from employers to employees (Rhee 2013:1). From 1979 to 2013, the percent of private sector workers covered by just a defined benefit plan fell from 28 to 2% (EBRI 2014). The percent of workers offered only a defined contribution plan which grew from 7 to 33% (ibid). The percent of workers participating in both types remained at about 10%. Private retirement plans usually invest in securities, the return on which has been depressed by both unfavorable market forces and the Federal Reserve's intentional intervention to reduce interest rates. Low returns not only hurt retirement plans but also to worker's individual savings for retirement.

## Private Savings Slowdown

Retirees need about 85% of their pre-retirement salary to maintain a comparable standard of living; Social Security provides about 35% of income, leaving a 50% gap that must be filled by a pension and/or savings (Rhee 2013:2). For the two thirds of households without any pension (Ford 2016), the entire gap must be filled by savings. Forty-five percent of working households have no savings at all (Kendzior 2016). The market crash of 2008 caused the value of worker's retirement nest eggs to free fall (Rhee 2013: 1). According to the Federal Reserve, 57% of Americans said they had to use some or all of their savings during the Great Recession (Kendzior 2016). The slow recovery eroded family income (Rhee 2013: 1) and made replenishing savings extremely difficult. Under current economic conditions, an individual will need between 8 and 11 times annual salary in savings to retire at age 65 (Rhee 2013: 12). The average near-retirement household has only $12,000 in savings (Rhee 2013:1). This leaves a national retirement savings gap of somewhere between $6.8 and $14.0 trillion (Rhee 2013:20). A person would have to save 15% of their salary during their working years to have sufficient funds for retirement (Rhee 2013:17), a requirement many find unrealistic.

But saving is only half the process. One's retirement nest egg is a product of both savings and the interest or other returns one earns on those retirement savings. The Federal Reserve has pursued low interest rates through large bond purchases from November 2008 until October 2014 (Feldstein 2016). The yield on 10-year treasury notes, which are considered a safe investment, has fallen to record low levels, under 1.4% (Zeng 2016). Accumulating savings for retirement is difficult at such low interest rates. Low interest rates also tend to increase asset prices (Feldstein 2016),

such as stocks, which in turn reduces the percentage return on those artificially inflated investments. Low returns, in turn, tempt investors to pursue riskier investments in pursuit of higher yields (ibid). If the Federal Reserve eventually normalizes interest rates, the price of overinflated assets is likely to fall (ibid) inviting even more losses. Since the onset of the Great Recession, stagnant salaries and poor returns on safer investments create strong head winds for a worker trying to save for retirement.

## Conclusion

If retirement is the grand social experiment of the last century, it is failing. Men reaching their 66th birthday can expect to live an additional 18.4 years and women 20.7 years (Social Security 2016). Retirees have no guarantee that Social Security will be able to maintain promised benefits that long. For those lucky enough to have pensions, the solvency of defined benefit pensions is uncertain, and the return on defined contribution plans is meager. Low interest makes it hard to accumulate personal savings. Until we find long-range solutions, retirement is in danger of becoming a short-term social experiment.

# Retirement Income, Russia

Oxana Sinyavskaya and Anna Ermolina
Institute for Social Policy, National Research University Higher School of Economics, Moscow, Russia

## Synonyms

Payment; Pension; Retirement account; Reward

## Definition

*Minimum subsistence level* is the assessment of minimal set of food basket and non-food goods and services that are necessary for individual's vital activity and health as well as compulsory payments and fees. Minimum subsistence level is set differently for children (0–15), the individuals of the active age (16–54/59 for women/men correspondingly) and the retirement-age persons (55/60 and over for women/men correspondingly) and varies across Russian regions.

*Retirement-age individuals* are persons at the age of 55/60 and over for women/men correspondingly.

*Active age individuals* are persons aged 16–54/59 for women/men correspondingly.

*Disposable monetary income* is the sum of monetary incomes from various sources except compulsory payments and fees.

*Real pension benefits* are the nominal pension benefits (in current prices) adjusted for consumer price index.

The *absolute poverty concept* is based on the comparison of one's income with the minimum subsistence level. If one's income is below this level, an individual/household belongs to the poor.

The *relative poverty threshold* is determined as 60% of national median income per capita. If one's income is below this threshold an individual/household belongs to the relatively poor.

The *subjective poverty concept* implies the subjective evaluation of one's sufficiency of income and material well-being.

*Mixed households* are households with pensioners and non-pensioners.

## Introduction

As a part of economic resources, incomes of old people (We use terms old people, old adults, seniors, senior citizens here as synonyms.) in large determine their standard of living and quality of life (Bowling 2005). Material welfare not only promotes old adults' financial independence but also expands the range of options available to them in other spheres of active ageing – from maintaining a healthy lifestyle (commercial sports clubs, commercial healthcare services) to social and cultural activities (lifelong education, visits to art shows and theatres, community service, and philanthropy). Meanwhile, in developed countries, including Russia, the main source of income of old people is pensions (Bowling 2005).

This entry analyzes the level and structure of seniors' incomes in Russia. For the purpose of this study, we define the threshold of old age as the retirement age – 55 for women, 60 for men. Russia has several types of pensions: old-age pensions, disability pensions, survivor's pensions, and social pensions (from 60/65 years for women/men, respectively, who had not been in employment). It is also worth noting that the Russian legislation does not limit pensioners' right to work or sets any limits for their incomes. Nonworking pensioners with small pensions are entitled to a compensation bringing their income to the minimum subsistence level set for pensioners in the region of their residence.

The main sources for the data used in this entry include the regularly compiled statistics by the Russian Federal State Statistics Committee (Rosstat), 2010 Russian national census, and 2015 micro-census, as well as surveys carried out by Rosstat and the Russian longitudinal monitoring survey of NRU-HSE (RLMS-HSE).

## Level and Structure of Incomes of Retirement-Age Persons and Pensioners

According to the 2010 Russian national census of the population and the 2015 micro-census, more than one third (35%) of retirement-age persons indicated more than one source of income. In the general population, the share of such people is smaller: 25% in 2010 and 23% in 2015.

The most common income source of seniors in Russia is public pensions. In 2010, 91.6% of retirement-age individuals were receiving old-age pensions and other types of pension (except disability pensions) and 6.7% – disability pensions; in 2015–92.6% people were receiving old-age pensions and 9.3% – disability pensions. Old-age and other types of pensions (except disability pensions) were reported as the main income source by 82.8% of retirement-age respondents in 2010 and by 80.5% in 2015, and disability pensions – by 4% in 2010 and 4.9% in 2015.

The second most often reported seniors' income source is wage which was reported by 18% retirement-age persons in 2010 and 19% in 2015. Meanwhile, for 12% and 13.0% of retirement-age respondents in 2010 and 2015, respectively, income from employment was the main source of income.

Incomes from private subsistence farming (production grown in personal subsidiary plots) were reported by 14.8% seniors in 2010 and 14.2% in 2015, although almost nobody reported them as the main source. Assistance of other people (dependence), leasing one's property to an individual or a company, savings and dividends are much less frequently reported sources of income among persons older than the active age (Russian national census – 2010; micro-census – 2015).

In the structure of monetary income of all-pensioner households, pensions and labor income predominate. As the Rosstat's Survey of the Population's Incomes and Participation in Social Programs for 2016 shows, in 2015 pensions accounted for 51% of pensioners' monetary income, and the share of labor income, including wages and perquisites from a main job, as well as

incomes from other regular or irregular employment, was 38.5%. In 2011, the share of labor income was much lower (29.5%), while the share of pension benefits in monetary income of all-pensioner households was higher (56.1%). It is also worth mentioning that in 2011 the share of different non-pension benefits was 11.3% while in 2015 it was down to 6.3%. That said, compared to developed countries, in Russia income from pensioners' ownership account for just an extremely small share of their overall income: only 0.7% in 2011, 1.2% in 2014, 1% in 2015. (Rosstat's Survey of the Population's Incomes and Participation in Social Programs for 2012, 2015 and 2016.)

Compared to other types of households and the general population, pensioners' households have higher per capita incomes. According to the Rosstat's Survey of the Population's Incomes and Participation in Social Programs, in 2015 the average per capita disposable monetary income in all-pensioner households was 25,675.9 rubles while for the general population the figure stood at 23,270.8 rubles.

## Dynamics of Pension Benefits

As has been shown, public pensions are the main income source for most retirement-age individuals, so their amount and dynamics influence significantly standard of living in old age. According to Rosstat, in April 2017 the average monthly pension benefit was 12,929 rubles (226.88 USD (Currency converter: https://finance.rambler.ru/calculators/converter/)), or 32.9% of the average gross monthly wage (Socio-Economic Situation in Russia 2017).

In the entire history of the Russian pension system, the sharpest decline in the real pension benefits compared to previous year took place in 1992 and 1999, when the value was down nearly by half (Fig. 1). From 2000 onwards, the average real pension benefit per annum increased from year to year. In the recent years, the real pension benefit has been shrinking, down to 96.2% and 96.6% in 2015–2016. In other words, in 2015 for the first time during the last 15 years, the real pension benefit was lower than the previous year's (Socio-Economic Indicators in the Russian Federation 1991–2015, 2016).

An analysis of the dynamics of the real pension benefits compared to 1991 shows that the greatest decline took place in 1999, when the real benefit was less than one third that of 1991. The real pension benefits came close to the level of 1991 only in 2009, and in 2010 exceeded it by one third.

Analyzing the dynamics of the pension benefits, one cannot ignore two important indicators – ratio of the average pension benefit to the pensioners' minimum subsistence level, and ratio of the average pension benefit to the average gross wage. The first indicator reflects a comparison of

**Retirement Income, Russia, Fig. 1** Real pension benefits, as percentage of previous year, 1991–2016

R

the pension benefit and the absolute poverty threshold, as accepted in the Russian Federation, and allows to indirectly compare the pensions' purchasing power. The second indicator enables to compare incomes of working population and pensioners and to figure out, approximately, to what extent the average Russian's pension compensates for the loss of the average wage income.

In the early 1990s, the gap between the average pensions and the pensioners' subsistence level was shrinking, and in 1999–2001 the pension benefits were by 20–30% smaller its level. In 2002–2007, the pension amounted to about one minimum subsistence level. But since 2008, as the pension benefits began to grow thanks to its massive indexation, in 2012 the ratio of benefits to subsistence level reached 176.5%. In the recent years, we have witnessed a continuous decline in the ratio of pension benefits to the subsistence level. In 2016, the average pension was 153.3% of the pensioners' subsistence level (Fig. 2).

To the contrary, in the first half of the 1990s the ratio of the average pension benefit to the average (gross) wage continued to grow because pensions were indexed more accurately than wages. After the crisis of 1998 and, later, after the start of the pension reform in 2002, the ratio of the average pension to the average wage began to decline, reaching the level of 22.9% in 2007. During the last 10 years, the ratio of the average pension to the average wage grew up to 33.7%, which is still low when measured by developed countries' standards. And it is also important to understand that the growth of this indicator in the last 2–3 years has been conditioned, first of all, by a decline in the average wage on account of the crisis, and not by the growth of the average pension (Socio-Economic Indicators of the Russian Federation in 1991–2015 2016).

## Employment of the Pensioners

If we trace the dynamics of the share of working pensioners in the overall pensioner population, we can see that it has been growing, except the period of 1998–2001, when pensioners' employment was limited by legislation and the old people were pulling out from the "official" labor market (Fig. 3). The pension reform of 2002 abolished these limitations, allowing pensioners not only to earn money without restrictions but also to recalculate the amount of their pensions taking into account the retirement contributions paid. As a result, the share of working pensioners was steadily growing in 2002–2015.

**Retirement Income, Russia, Fig. 2** The average pension benefit as a percentage of the pensioners' minimum subsistence level and the average gross wage (%), 1992–2016

**Retirement Income, Russia, Fig. 3** Dynamics of the share of working pensioners in the total number of pensioners (%), 1994–2015

However, since 2015 some of the retirement contributions paid for pensioners do not count when their pension benefits are reassessed, and since 2016 working pensioners' pension benefits are no longer indexed (Federal Law No. 385-FZ Dated December 29, 2015). The latter decision brought down the numbers and share of working pensioners reported by the PFR statistics. Whereas on January 1, 2016, according to Rosstat, Russia had over 15 million working pensioners (35.7% of all pensioners), a year later the figure was down by more than one third, and on January 1, 2017, Russia had 9.9 million working pensioners (22.9% of all pensioners). The share of working pensioners is higher among old-age pensioners – 24.4%. Because the statistics collected by the PFR and reported to Rosstat reflects only officially employed pensioners, one can suppose that after the abolishment of indexation not all of the previously working pensioners retired and some of them opted for informal employment.

## Poverty Levels Among Retirement-Age Persons and Pensioners

According to Rosstat, retirement-age persons are the group the least exposed to risks of absolute poverty. The index of poverty risk – the ratio of poverty level in a specific sociodemographic group to poverty level in the general population – in 2015 was 0.67 for men aged 60 and older and 0.56 for women aged 55 and older, respectively. Children younger than 16 and young people aged 16–30 face the highest poverty risks. If we look at the correlation between poverty risks and economic activity of different sociodemographic groups, working pensioners face minimal poverty risks (poverty risk index was 0.35 in 2015), whereas poverty risks for nonworking pensioners are practically the same as for the adult working population (0.83 against 0.81 in 2015, respectively) (Socio-Economic Indicators of Poverty in 2012–2015 2016). During the last 20 years, many researchers have argued that retirement-age persons and pensioners are less exposed to risks of absolute poverty (Braithwaite 1997; Ovcharova 2008; Denisova 2012).

Meanwhile, until quite recently, levels of subjective poverty, as assessed by pensioners themselves, were higher than those of the general population (Ivanova 2003; Presnyakova 2005; Sinyavskaya 2006). After a sharp rise in pensions, in 2010, the gap between the levels of absolute and subjective poverty has narrowed (Sinyavskaya 2012). However, in the situation of the crisis that began in 2014, when the real pension benefits started to decline for the first time in

**Retirement Income, Russia, Fig. 4** Distribution of households by the ratios of households' per capita monetary incomes to the levels of regional minimum subsistence level (%)

15 years, it would seem natural to expect a rise in the levels of subjective poverty.

According to estimates made on basis of the RLMS-HSE for 2013, the levels of absolute and relative poverty of different types of households are similar, although sociological surveys usually suggest a higher incidence of absolute poverty than statistical data. Absolute poverty was recorded in 0.8% of all-pensioner households, 18.3% of mixed households, and 27.3% of households without pensioners; relative poverty – in 3.9%, 23.5%, and 28.7% for the households referenced above, respectively.

According to the RLMS-HSE data for 2013, practically half of the households without pensioners belonged to low-income groups (with per capita income less than 1.5 of the minimum subsistence level) while nearly one quarter of households with pensioners (23.5%) have incomes exceeding three subsistence level, and about one third of them (30.6%) – from two to three subsistence levels.

A principal factor explaining higher incomes of households with pensioners is pensioners' employment. According to the 2013 RLMS-HSE data, absolute poverty was recorded in 3.6% of households with working pensioners and in 12.2% of households with nonworking pensioners, and relative poverty was recorded in 5 and 17.4% of households, respectively. Differences between poverty levels are even sharper in mixed households combining pensioners and non-pensioners: absolute poverty was recorded in 5.5% of households with working pensioners and 25.1% of households with nonworking pensioners, and relative poverty was recorded in 7.7 and 31.7% of households, respectively.

Nearly half (47.9%) of households with working pensioners have incomes amounting to three minimum subsistence level (Fig. 4). Unlike these households, households with nonworking pensioners are concentrated in medium-income groups (1.5–2 and 2–2.5 subsistence levels). And finally, households without pensioners predominate in low-income groups, except 19.9% of households with incomes more than three minimum subsistence levels (Sinyavskaya et al. 2016).

## Conclusion

The main source of seniors' income in Russia is their pensions awarded after they reach a certain age, provided they have a required length of insurance period. The Russian pensioners, meanwhile, have the right to receive their pensions and wages

in full when they work, so wages are another important source of their incomes. Nonworking pensioners whose pension is lower than the regional level of minimum subsistence level, receive compensatory payments.

So, risks of absolute poverty for old people in Russia are minimal and risks of relative poverty are much lower than for other social groups, especially for families with children. Households with working pensioners have the highest average income levels.

Incomes from sales of produce from personal subsidiary plots (subsistence farming), important for survival of Russian households in the 1990s, are presently the third most common seniors' income source, and even that primarily in rural areas. But it is very seldom that pensioners report this activity as their main source of income.

Other sources of income, whether an assistance from relatives or personal savings, incomes from assets – are very rare and make but a very small part of the Russian old adults' incomes.

## Synonyms

Aged care home; Housing; Privatization; Public policy; Public-private partnership; Retirement home

R

## Definitions

Public-private partnership is a concept where the public and private sector organizations bring together their resources, which could be material or immaterial to deliver an infrastructure.

Retirement village is a residential complex that provides independent living with community style accommodation for persons predominately aged over 55 who have retired from full-time employment.

## Introduction

In the last couple of decades, the percentage of older adults has increased significantly globally. For example, in Australia, between 1993 and 2013, the percentage of people aged 65+ has increased from 11.6% to 14.4% (Australian Bureau of Statistics 2013). In fact, the proportion of older Australians has been projected to increase to 20% by 2056 (Bo et al. 2015). Also, in China, specifically Shenzen, it has been projected that by 2020, the ageing population will reach 10% of the total population in the city (Zhen 2016). Essentially, the rapid demographic ageing globally has put a lot of pressure on many social amenities including housing (Hu et al. 2017). Currently, there are many housing options for older adults; however, a significant proportion of them prefer to live independently in a retirement village. This is because retirement villages or otherwise called aged care homes have been noted to be age-friendly compared to family homes. Retirement villages usually have a range of on-site household facilities and support services such as libraries, hairdressing saloons, transportation, etc. (NSW Government 2017; Liu et al. 2018).

However, despite the clear significant benefits of retirement villages to both the young and older adults, the current global retirement village market is underdeveloped. The existing retirement village markets in some developed countries including Australia, the UK, and Canada are stricken with many problems of which the major one is high cost of investment. Many retirement village developers invest a lot of funds in the acquisition of land, the daily maintenance, and operation of retirement villages as well as pay huge taxes (Retirement Village Association 2011). These result in high rental and service fees, which makes it difficult for many retirees to afford. Therefore, it is imperative for a more innovative approach such as public-private partnership (PPP) to be adopted to enhance the development of affordable retirement villages for the elderly (Retirement Village Association 2011; Liu et al. 2018). PPP is basically a concept where the public and private sector organizations bring together their resources, which could be material or immaterial to deliver an infrastructure (Osei-Kyei and Chan 2015). Usually, in PPPs, the public authority provides land and tax exemptions and ensures a favorable enabling environment for private investment. The private partner assumes the responsibility of designing, financing, building, and operating the facility over a period (Osei–Kyei and Chan 2016). Although PPP is not a new concept, it has received limited attention in the global retirement village market. Importantly, PPP has been used in many different infrastructure sectors including transportation, education, health, security, and recreational; however, for retirement village/aged care homes development, the PPP concept has apparently received little or no attention (Retirement Village Association 2011). Considering that retirement villages provide significant benefits to retirees globally, the adoption of the PPP model in retirement villages development is crucial and a worth option. The use of PPP for retirement village development will lessen the huge investment costs and provide age-friendly affordable housing to the aged (Liu et al. 2018).

Against this background, this chapter reviews the status of the global retirement village market and proposes policy directions and strategies that should be carefully observed to ensure a successful application of PPP in retirement village development. Following this introduction is the review of global retirement village development, particularly in Australia, the UK, and the USA. The next section explores the key challenges in the retirement village market. The last section reviews how PPP could be applied successfully in retirement village development.

## Global Development of Retirement Villages

This section reviews the status and progress of retirement village markets across the world with specific reference to Australia, the UK, and the USA.

### Australia

In recent years, the number and proportion of older Australians have increased. In 2017, there were 3.8 million Australian aged 65 and over, which comprises 15% of the total population. It is anticipated that there will be 8.8 million older people by 2057 and 12.8 million elderlies (25% of the population) by 2097 (Australian Bureau of Statistics 2014). This ageing population has contributed to significant housing demand challenges in Australia. Productivity Commission (2015) categorizes the housing options for older Australians into six. These include home owner, residential aged care, retirement villages, mobile home communities, social housing, and private rental. Accordingly, although the most popular housing option for older Australians remains their own home, an increasing proportion of older Australians are choosing to move into retirement villages in order to meet their financial and lifestyle preferences (Productivity Commission 2015).

The Australian retirement village industry originated in the 1970s and has since then been regulated by several laws. The first emanated Australian retirement villages were solely owned by the private sector, and they had a range of accommodation, facilities, and services to meet the requirements of the elderly (Hu et al. 2017). In other to ensure sanity in the Australian retirement village market, several state-based legislations were introduced in the late 1980s. The state-based legislations were primarily introduced to protect the rights and interests of retirees. Such regulations include the Aged Persons Homes Act 1954, Retirement Village Act, Retirement Village Regulation, Retirement Village Code of Practice, and Fair Trading Retirement Village Code. Essentially, these laws and regulations also clarify various aspects of the village development and operation, such as pre-entry requirements, information disclosure, and the resolution of complaints and disputes (McNelis and Herbert 2003). Since the introduction of the retirement village act and regulations, the growth of the Australian retirement village market has been quite good in the past few decades, and it has been forecasted to reach around 3000 with 320,000–350,000 village residents by 2023 (Hu et al. 2017). There are two categories of Australian retirement village residents – those who are considering a move to a retirement village. They are the older and younger retirees. The older retirees are those who wish to relocate due to declining health, whereas the younger retirees are those who are concerned about their future health needs and may also be attracted to village amenities and lifestyle (Crisp et al. 2015).

Normally, retirement village fee arrangements are determined by village developers on certain key parameters; they include the local property value, the tenure term, services and amenities available at the village, and the unit size and design (Towart 2005). Considering these parameters, the total retirement village fee usually includes these costs: (1) entry contribution, a lump-sum contribution paid at the time of entry to the village, in forms of payment, loan, donation, or some combination of these; (2) ongoing costs, day-to-day retirement village running costs; and (3) deferred management fee, deduction from the resale price or withheld percentage of the entry contribution plus a percentage of the capital gain when residents move out or pass away (Finn et al. 2011). Residents are offered different terms of tenure, and this, apparently, has an influence on their level of financial security. This is because some retirees acquire loans to pay for their resident fees (Productivity Commission 2015). Overall, despite the numerous challenges, the Australian retirement village market is considered one of the matured in the world. The number of retirement villages or aged care homes is increasing because of the rapid increase in older adults. There is certainly a better future for the Australian retirement village market unless more innovative policies such as PPP are introduced by the government in the market.

### The UK

In the UK, the number of people aged 65 and over grew by 1.8 million between 2004 and 2014, and it is forecasted that by 2024, there will be 13.8 million people aged 65 and over, representing 20% of the population, compared with 16% in 2004 (ONS 2018). These figures show the increase in life expectancy in the UK in the next decade. Further, the stats indicate the potential increase in elderly health needs and housing with specific old-age requirements in the next couple of years in the UK.

To meet these future demands, retirement village development has become quite popular in the UK in recent times. However, it should be mentioned that old adults moving into aged care homes/retirement village is not a new thing in the UK; essentially, aged care home/retirement village has been in existence for the past 30 years. Usually, most UK retirees choose to be in aged care homes/retirement villages primarily because they require special housing care or prefer to live independently in an aged-friendly community. This implies that many retirees believe that retirement village/aged care homes can provide them the necessary support and attention that are needed by every aged. Some of the supporting facilities and services in the retirement villages in the UK include equipment for care, caretaker staff, libraries, help with domestic tasks, and shopping (Baker 2002). The key regulation in the UK that protects the interest and needs of the elderly is the Care Act 2014. The act was drafted in 2014 and became effective in 2015. The act ensures that the elderly is given the necessary support and care at retirement villages/aged care homes. Further, the act makes provisions for some financial support to retirees based on the outcome of an initial need assessment (Age 2019). Lastly, the Care Act ensures that care home developers and operators provide enough support services to meet the expectations of care home residents. It should be mentioned that in the UK, older adults have other range of housing options/care including sheltered housing, respite care, and assisted living; however, the most popular ones are retirement villages and residential care homes (AXA PPP Healthcare 2019). Although these two major housing options may have some similarities, their mode of services and residents are different. Retirement villages are developed for older adults who can take care of themselves. In fact, residents in retirement villages do not need special care such as dressing and medication. On the contrary, residential care homes in the UK are developed for older adults to provide only special care such as bathing, medication, and dressing. Residents in such homes are carefully assessed by the local council before being admitted. Importantly, retirement village is the new trend, and it is growing rapidly as mentioned earlier. Like Australia, the UK retirement village market has potentials but would require innovative government policies such as PPP to develop and meet the expectations of older adults.

### The USA

Similar to Australia and the UK, the US population is also ageing, and one of the primary drivers for this is low mortality rate. Survivorship rates have shown consistent improvement for many decades in the USA. In fact, according to the Social Security Administration (2018), the average life expectancy of a 65-year-old man is 84.0, whereas the average life expectancy of a 65-year-old woman is 86.5. Further, the Social Security Administration (2018) have indicated that one out of every four 65-year-olds will live to be 90 years old, with one of every ten expected to live past 95 years of age (Social Security Administration 2018). As of 2017, almost 47 million US citizens are 65 years old and above, accounting for 14.9 percent of the total population. It has also been projected that the senior population in the USA is likely to double in the couple of decades (Senior living, 2019). The US Department of Health and Human Services (DHHS) has emphasized that most of the senior citizens or older adults will need an accommodation that provides all the necessary health and infrastructure facilities before they can enjoy their elderly life over time. This has therefore reinforced the need for more retirement villages to be developed in the USA to help the aged live a stress-free life. Retirement villages in the USA are also referred to as senior living/retirement communities. The senior living communities often have care coordinators who help manage residents' health and other personal needs.

Usually, most US senior citizens move to senior living communities due to several reasons including (1) having no adult children to assist them and (2) having serious health conditions that require professional assistance (Senior Living 2018). Residents in retirement communities pay rents or purchase apartments through their personal savings, whereas others particularly the low-income earners purchase or rent apartments with the support of the Federal housing program. In the USA, the Assisted Living Policy is the only regulation relevant to the retirement village market. However, each state has its own form of the policy. The aim of the assisted living regulation is to protect the interests of senior residents in care homes as well as provide specific residential requirements for care home operators and developers.

## Key Challenges in the Retirement Village Industry

Like any other industry, the retirement village industry is also stricken with several challenges, and it is crucial that practitioners are informed of these challenges to ensure the sustainability of the industry. Hu et al. (2017) conducted a review study on retirement village and identified several emerging problems which need critical attention by stakeholders. These challenges include affordability, social environment settings, physical environment settings, penetration levels, the effects of ageing baby boomers, technology applications, sustainability, and lack of policy support. In terms of affordability, they found out from a number of studies that village living cost is a major concern to retirement village residents. In fact, the high cost of rent or purchase is deterring most young retirees from living in retirement villages or aged care homes. Apparently, the high cost of rent or purchase could be because of the high cost of investment. Developers usually spend a lot of funds in developing and operating retirement villages to the standard required by the government. In the end, the high cost of investment is then transferred to residents. Affordability is certainly a crucial issue which stakeholders in the retirement village industry would have to thoroughly review moving forward. Hu et al. (2017) recognized social environment settings as a major challenge because usually the village recreational facilities do not meet residents' requirements. Further, the services provided in retirement villages create an over-dependency for residents. Hu et al. (2017) also explained that retirement village physical environment can affect resident's social life, thereby leading to their dissatisfaction. Lastly, in terms of technological application, Hu et al. (2017) explained that retirement village developers/operators are confronted with a set of issues regarding the type and application of technological devices in retirement villages.

Crisp et al. (2013) studied the factors that encouraged and discourage retirees for entering retirement village. They identified several lists of discouraging factors, and some of these include the lack of privacy of residents, expensiveness of retirement village units, limited space and garden in retirement villages, and the change of doctor by residents.

Because residents in retirement village live together as a community, they believe that they tend to lose their independence and privacy. It is also not surprising that affordability was identified by Crisp et al. (2013) as a major issue. As mentioned earlier, residents often pay high rents and mortgages for retirement village units, and these high rental fees are associated with the high cost of investments of retirement village development (Retirement Village Association 2011).

The retirement village council (2013) also conducted a survey with the aim of identifying the key issues facing the retirement village industry in Australia. They found out three major issues: these are (1) the dissatisfaction of residents with the amount of fees charged during village tenure, (2) dissatisfaction with the actions of the retirement village operators, and (3) unclear and ambiguous contract arrangement.

Petersen et al. (2017) explored the constraints in the retirement village industry in Australia by means of a questionnaire survey with residents. They mentioned that the two critical issues which affect retirement village development are the financial and legal obligations. Importantly, the financial obligation has to deal with the high cost of fees paid by residents during their village tenure. In fact, Petersen et al. (2017) emphasized that many residents are

concerned about the high exit fees and refurbishment costs. The legal obligation is concerned with the complicated contractual terms set out by some retirement village managers (Retirement Village Council 2013).

The above review of challenges needs critical attention by policy makers and external stakeholders to ensure the sustainable development of the global retirement village industry. The increasing number of the aged requires more effort to ensure that the retirement village market becomes attractive to both the young and old retirees.

## Public-Private Partnership for Retirement Village Development

From the above review of the status and challenges of the global retirement village, it could be realized that more strategic policy actions and efforts are required by governments, retirement village residents' associations, and retirement village developers' associations. In fact, the need to care for the elderly is eminent, and to do this, there have to be innovative policies and approaches from governments.

Undoubtedly, affordability is one of the crucial challenges currently facing the retirement village industry. Rents and mortgages are very expensive for both the young and old retirees, and the major contributing factor toward the high rental fees is the increase in investments costs (Retirement Village Association 2011). Retirement village developers invest a lot of funds in the development and operation of villages in order to keep up to the standard and requirement of residents. The huge investment costs are eventually transferred to residents. Indeed, one of the best options to help in addressing the issue of affordability, poor quality service, and many other challenges in the retirement village industry is the adoption of the public-private partnership (PPP) concept. The PPP concept has been extensively used in many infrastructure sectors globally including affordable public housing; however, for retirement village development, this concept has least been implemented or utilized. Currently, there are attempts by some countries particularly Canada and China to ensure the implementation of PPP in the retirement village industry. The adoption of PPP in retirement village development could bring lots of benefits to governments, the elderly, and other stakeholders. These benefits have actually been realized in many other infrastructure sectors including affordable housing. Some of the benefits that PPP could bring into the retirement village industry include reliable and quality services operation, affordable rental and mortgage fees, low operation and maintenance costs, the sharing of risks, creativity and innovation, and sustainable retirement village development (Osei-Kyei and Chan 2018; Osei-Kyei et al. 2014). Therefore, there is the need for governments to embrace the PPP concept in the development of retirement villages for the aged.

### Strategizing PPP Retirement Village Projects: The Best Practices

The attempts by some countries to apply the PPP concept in the retirement village industry are commendable and an important step toward meeting the expectations of the aged. However, PPP retirement village projects can only be successfully implemented if certain crucial strategies are taken into consideration by stakeholders. Based on the review of the challenges in the retirement village industry and the experience of many past PPP projects (i.e., both successful and failed) in other infrastructure sectors including public housing and transportation, some proposed effective strategies for developing PPP retirement village include mutual and clear benefit objectives of both parties, effective risk allocation, external stakeholder consultation, optimal capital structure, government providing tax rebate and exemption, and consistent performance monitoring.

Generally, irrespective of the infrastructure sector, having mutual benefit objectives is very essential in the successful implementation of PPP projects. Mutual benefit objectives imply having a common goal and outcome in the delivery of a PPP project (Osei–Kyei and Chan 2016). Retirement village project development is crucial to the elderly; therefore when the government and private developers are partnering to deliver a retirement village project, they should make sure that they have clear and common objectives. It is in no

doubt that the public and private sectors usually have very different goals in PPP contract arrangement; however, both parties should at least consider the interests of the aged and retirees when setting up the performance objectives of their retirement village PPP projects.

Equitable risk allocation is also crucial for PPP retirement village development. Some key risks in retirement village PPPs include demand risk, political risks, land acquisition risk, macroeconomic risk, and operational cost overruns. These potential risk factors should be carefully allocated among the key parties. Ideally, risks should be allocated to the party with best mitigation plan (Osei-Kyei and Chan 2017).

Consultation with the key external stakeholders in the retirement village industry is also critical in the successful implementation of PPP retirement village projects. Some key external stakeholders in the retirement village industry include the retirement village developers association and other senior citizens in the society. The opinions of these stakeholders have to be incorporated in the contractual arrangement. Importantly, failure to engage with the external stakeholders could raise tensions between the project parties and retirement village residents. Eventually, the substantial benefits of adopting the PPP concept for retirement village development will not be realized or met.

Optimal capital structure refers to the mix of debt and equity that can maximize a firm's value (Chen et al. 2015). Essentially, optimal capital structure is required to ensure the affordability of retirement village PPP projects. Several quantitative and qualitative factors determine the optimal capital structure of PPP projects; such factors include the cost of land, construction and operation costs, the capital market, risks, government financial support, and rate of return. These factors should be analyzed thoroughly before determining the sources of capital for retirement village PPP projects.

Undoubtedly, tax exemptions are critical in minimizing the overall life cycle costs of retirement village PPP projects. Huge taxes on equipment, goods, and imports often increase the construction and operational costs of projects significantly. Therefore, governments should provide tax exemptions on certain goods and equipment used for the development of retirement village PPP projects. This will essentially reduce the developer's investments costs, thereby leading to more affordable retirement village units and apartments.

Lastly, consistent monitoring of the operation and maintenance of retirement village PPPs is crucial in ensuring quality service. Although, the private sector is generally known to provide quality service and operation, there are sometimes where few private operators may not comply with the operational standards expected. Therefore, the contracting authority should regularly monitor the maintenance and operation of retirement village developers as usually done in other PPP projects in other sectors such as roads, hospitals, and recreational centers.

## Conclusion

The global ageing population has resulted in the increase in demand of retirement villages. However, the current retirement village industry is stricken with several challenges including affordability, poor quality of services, and poor sustainability. PPP is a method that has been applied in many infrastructure sectors by many countries, and it has over the last couple of years proven to be quite effective in addressing critical infrastructure challenges such as affordability and poor quality of service. Therefore, there is the need to apply the PPP concept in the global retirement village industry to meet the demands and expectations of the elderly. To successfully implement PPP in the retirement village industry, some proposed crucial strategies and policy measures that should be considered include mutual and clear benefit objectives of both parties, effective risk allocation, stakeholder consultation, optimal capital structure, government providing tax rebate and exemption, and consistent performance monitoring.

# Revenue Diversification and Tax Volatility

Whitney B. Afonso
University of North Carolina at Chapel Hill, Chapel Hill, NC, USA

## Synonyms

Elasticity of local government revenue portfolio; Local government revenue portfolio; Sensitivity

of local government revenues to fluctuations in the economy

## Definition

Local governments maintain revenue portfolios that are filled with the different taxes and fees that pay for their services. These taxes and fees are impacted by changes in the economy differently.

## Introduction

Local governments in the United States are required to have balanced budgets. What this means is that the revenue that local governments (counties, municipalities, and special districts) generate through taxes and fees and other instruments must be equal to or exceed how much is spent every year. To cope with uncertainty, most local governments will maintain a fund balance. These fund balances are often referred to as rainy day funds and are essentially savings accounts for the years when revenues do not cover expenditures. When and why might this happen? If there is a natural disaster, the local government may be responsible for unforeseen expenditures. If policymakers are being imprudent with their resources and being too liberal with their revenue forecasts, there may be an imbalance. If there is an economic downturn, the revenues budgeted for may be higher than the actual receipts. It is this last possibility that will be the focus of this entry.

## Revenue Volatility and the Business Cycle

The economy has a natural business cycle with booms and busts, meaning there are good times and there are bad times. This affects individuals' and businesses' resources and revenues and also affects government revenues. These normal fluctuations result in uncertainty when forecasting revenues, and for this reason many local governments choose to diversify their revenue portfolios. This means that instead of relying heavily on one or two tax instruments, local governments are choosing to rely on many instruments. This notion of diversification of the portfolio as a means to increase stability emerges from a corporate finance theory: modern portfolio theory. Simply put, modern portfolio theory asserts that if you want a stable portfolio of stock investments, it is best to not invest it all in one place and that by investing in hundreds (or more) of stocks, it is more likely that when one declines, others will be increasing in value.

While that makes sense in the corporate finance world, does it make sense in the public finance world? In particular, does it make sense for local governments? Local governments in the United States rely heavily on property taxes. Property taxes are inelastic (with an estimated elasticity of 0.12) which means that they do not fluctuate with changes in the economy much (McCubbins and Moule 2010). Thus, when the economy declines, they are left relatively unchanged and stable. Of course, this also means when the economy is growing, they are left relatively unchanged and stable. So when local governments are diversifying their revenue portfolio, it means they are most likely moving away from the property tax, which is stable, to other revenues which are likely less stable.

An inelastic tax is one that is not sensitive to the fluctuations of the business cycle (or changes in the economy). For a fluctuation of 1% in income, an inelastic tax will fluctuate by less than 1%. This means that in times of economic growth, the revenue of an inelastic tax will grow more slowly than the economy and during an economic downturn, the revenue will decrease by less than income. Therefore, inelastic taxes are more stable and predictable than elastic taxes because inelastic taxes are less affected by changes in the economic conditions of a jurisdiction (Afonso 2017).

A value of 1 would mean unit elastic, so it changes at the same rate of the economy.

Values less than 1 are considered inelastic, and values greater than 1 are considered elastic.

What are these other revenues that local governments are moving toward? In many states, the second largest source of own source revenue (so not intergovernmental transfers from the state or the federal government) are local sales taxes. Sales taxes unlike the property tax are relatively elastic, meaning the revenue fluctuates more than changes in the economy. This is especially true for the sales taxes in many states that omit food and clothing from the sales tax base. Sales taxes that include the full tax base are close to unit elastic, but once those key elements of the base are removed, they become much more volatile. There are also local income taxes in some states, and they, like the sales taxes, are more volatile and unstable than property taxes. See Table 1 for selected estimates of elasticity. Of course, local governments rely on numerous other smaller revenue instruments like fuel taxes, alcohol taxes, and impact fees, and those are not as elastic as sales or income taxes.

## Additional Reasons to Diversify Revenue Portfolios

There are additional reasons that local governments may choose to diversify their revenue portfolios than just for stability. In fact, adopting elastic revenue instruments when currently reliant on inelastic ones may be advantageous to government revenues. The revenue generated by inelastic instruments are relatively unchanged in both boom and bust periods, which means that in periods of economic growth they will not grow with the economy and will have to have their rates increased to keep up. Additionally, different revenue instruments often tax different subsets of the population, and by expanding the number of revenue instruments being used, a local government may be able to spread the burden around in a more equitable way. For example, if a community has a large tourism industry, reliance solely on property taxes may not capture much of the burden that tourists have on costs; however the use of occupancy taxes and sales taxes will allow tourists to share some of the burden for financing government that they benefit from while they visit the community.

There are also reasons that are not strategic, but out of necessity. Many states and local governments are subjected to strict tax and expenditure limits that may limit property tax rates, property tax revenues, and/or property tax growth. These tax and expenditure limitations may mean that local governments must look beyond the property tax for increased revenues as new needs and demands for additional services surface. Outside of the legal restrictions, there are also political ones. Property taxes are incredibly unpopular in the United States, and citizens often prefer sales taxes to increased property taxes.

**Revenue Diversification and Tax Volatility, Table 1** Estimates of short-run elasticity

## Evidence

Despite the potential advantages of diversification of the revenue portfolio it is critical to understand how diversifying the revenue portfolio will affect the volatility of revenue. Since local governments are not legally permitted to budget for more expenditures than their expected revenues, and in some states spend more than they generate, it is critical to understand how the makeup of revenue portfolios may affect revenues. This area of literature is growing, and the evidence is mixed as to whether diversity of the revenue portfolio leads to increased volatility.

On one extreme a study finds that diversification leads to higher expenditures and fewer revenue shortfalls and an overall substantial increase in stability (Jordan and Wagner 2008). Similarly, though the magnitude of the effect is smaller, another study finds that diversification does lead to more stability especially when the revenue instruments are more visible (Carroll 2009). While those studies focus on broad measures of diversification, more recently three studies have examined the contrast between those local governments that depend more heavily on property taxes and those that rely more heavily on a mix of property taxes and local sales taxes. These three studies find that greater reliance on local sales taxes increases volatility of own source revenue (Afonso 2013, 2017; Hou and Seligman 2010). The Afonso (2017) study examines counties in North Carolina which do tax food, making it likely that these results are actually conservative and understate the effect that increased reliance on local sales taxes would have on the volatility of own source revenue.

One important question is how should we appropriately measure volatility? Many of these studies measure it the same way. Volatility is defined as the difference between the expected own source revenue and the actual own source revenue. Expected own source revenue is calculated in a multistep approach. The first step is a simple revenue growth trend regression model, where own source revenue is modeled as a function of time. The second step is to estimate the residuals and to calculate the expected values of own source revenue. This method allows for each jurisdiction to have its own growth trend. For more on this method, please see Afonso (2017).

## Revenue Portfolio Diversity at the State Level

It is not just local governments that need to consider how the diversity of their revenue portfolio may impact the volatility of their revenue receipts. States and the federal government are affected too. However, the federal government in the United States is able to deficit spend so revenue volatility does not present the same challenges as it does to state and local governments. States in the United States most frequently rely on a mix of income taxes and sales taxes. As previously discussed, those instruments are elastic. Therefore, diversifying the state-level revenue portfolio toward inelastic instruments like fuel taxes and cigarette taxes may increase stability. It is key to modern portfolio theory that the instruments in the portfolio negatively covary, meaning that as one increases, another decreases. This is likely an unrealistic ambition in taxes and fees, unless the government taxes inferior goods (which is the economic term for goods whose demand increases as income decreases), but by balancing elastic and inelastic revenue instruments, strides toward stability are likely to be achieved. The evidence at the state level suggests that diversifying the revenue portfolio may decrease revenue volatility (e.g., Gentry and Ladd 1994). The following are the fundamental questions that government units need to ponder: what are the existing revenue instruments, what instruments are available to them, and how (in) elastic are those instruments?

## Conclusion

Volatility of revenue has numerous ramifications for managing local governments. If local governments have more volatile revenue portfolios, then they need to manage their resources so that when unexpected shocks do occur, it does not disrupt their service delivery. One way that local governments may manage this volatility is through robust fund balances. Another way would be to be conservative with revenue forecasts. The problem with that solution is there is an opportunity cost to systematically collecting more revenue than forecasted for both the government and the citizens that are being overtaxed or underserved.

Understanding the impact of revenue instrument choices on volatility is especially critical in

the United States where there are balanced budget requirements and local governments are only permitted to take out debt for capital expenditures (and often with specific additional requirements). Whether local governments are considering diversifying their revenues or whether they already have, understanding the impact of those revenue instrument choices on their revenue receipts across the business cycle is critical and must be managed accordingly.

Diverseness; Diversity; Expansion; Variation; Variegation; Variety; Variousness

## Definitions

In common parlance, "diversification" is the injunction: "do not put all your eggs in one basket." With diversification, the idea is to spread the eggs across many baskets to spread the risk across many baskets. Diversification originated in investment finance and diffused to other disciplines, for example, public finance. Diversification was formalized in academic writing through the modern portfolio theory. The theory is credited to Markowitz (1952), and it describes the process by which an investor selects a particular investment portfolio (Carroll and Stater 2008). In the field of public finance, the theory birthed the concept of "revenue diversification." Revenue diversification is a specific strategy to minimize revenue volatility (Frumkin and Keating 2011). Its mirror opposite is revenue concentration. Keating et al. (2005) argue that revenue concentration is heavily freighted with problems such as declines in revenue and organizational sustainability risks. Therefore, on a balance of probabilities, it is commonly argued that revenue diversification, as opposed to revenue concentration, is a highly sought-after policy, for, among others, it engenders fiscal stability.

## Introduction

Public organizations are purposeful, that is, they are created for a purpose. In this regard, governments are created to, among others, deliver the social contract between the rulers (represented by the government on the one hand) and the ruled (represented by the citizens on the other). The social contract places an obligation on the state to provide goods and services that the market neither provides (e.g., law and order) nor provides in sufficient quantities (e.g., education and health). At times, public intervention is justified on account of market failure. No matter the justification, public provision of goods and services is a fact of life ever since the emergence of government more than 10,000 years ago. The question that arises is: how does the government finance the provision of goods and services? In a majority of cases, the government lays a tax to finance the provision of goods and services. Taxation is as old as organized government, that is, governments have laid taxes since antiquity. The question that comes to the fore is: how diversified are the revenue sources? In a related vein, a cognate question is: will the existing revenue sources guarantee the survival and sustainability of the organization? The foregoing question is important for, as Pfeffer and Salancik (1978, p. 2) suggest, "the key to organizational survival is the ability to acquire and maintain resources."

If the foregoing cannot be answered in the affirmative, the state may find itself in fraud of the social contract by failing to provide social goods and services. The failure to provide social goods and services can have fatal consequences (e.g., failure to provide life-saving medicines can potentially condemn vulnerable subpopulations such as the poor and children to preventable deaths). In a related vein, the failure to provide goods and services can condemn vulnerable groups such as the poor and women and the girl child to diseases of poverty such as TB, HIV and AIDS, malaria, leishmaniasis, schistosomiasis, and malnutrition. In other instances, poor service delivery can lead to public service delivery protests. In sub-Saharan Africa, South Africa has gained the label "Protest Capital of the World" (Bianco 2013). To illustrate, by July 2018, South Africa recorded 144 public service delivery protests (Makhafola 2018). In a majority of cases, governments fail to deliver social goods and services due to fiscal strictures. Of course, there are other causes such as corruption and implementation challenges. For instance, in Botswana, during the National Development Plan 10 period, the development budget was underspent by an average of 17.3% for the years 2011/2012 through 2013/2014 due to delayed project implementation (see Matambo 2015), therefore meaning that Botswana were denied goods and services.

Causes of fiscal strictures are numerous; however, the most egregious one is a narrow revenue base. The problem is extremely prevalent in monocultural economies. Monocultural economies are characterized by the dominance of a single export. Examples are Nigeria (oil) and Botswana (diamonds). When there are price shocks in commodity markets, as happened during the last global economic crisis, the worst after the 1929 Great Depression, monocultural economies disproportionately suffered. Therefore, this calls for more revenue diversification post-2007. Diversified resources will aid in the delivery of the social contract.

## Monocultural Economies and Revenue Concentration

Due to the dominance of a single export in monocultural economies, there arises the problem of revenue concentration. In the realm of public finance, revenue concentration means that a bulk of the country's revenue is contributed by one sector. Therefore, if there are problems in the said sector, total government revenue may plummet and, therefore, plunging the country into fiscal difficulties. In a confirmatory note, Keating et al. (2005) argue that revenue concentration is heavily freighted with problems such as declines in revenue and organizational sustainability risks. Botswana is an exemplar case of the disastrous danger of a monocultural economy and revenue concentration. At the time of independence on 30 September 1966, Botswana

was one of the poorest countries in the world. Its economic viability was doubted, and it was a foregone conclusion that it will be incorporated into the Republic of South Africa. However, the discovery of diamond deposits, the first being the discovery of a kimberlite pipe in Orapa in 1967, followed by other finds, brought about an economic turnaround. The country was able to extract mineral rents to finance human, social, and economic development. As a result, Botswana was able to graduate into the ranks of middle-income economies in 1992 and is currently an upper middle-income economy. Its development trajectory continued unabated until the onset of the global financial crisis (GFC). The GFC metamorphosed into a global economic crisis and later an economic downturn. Due to the foregoing, the country experienced a new normal, fiscal strictures that forced the choice of budget deficits into the hands of the government. Ever since 2007, the country has largely dealt with chronic budget deficits. Due to the continued subdued demand for diamonds, hence declining foreign currency earnings, budget deficits are a norm. To illustrate, total revenue and grants for the 2019/2020 financial year are estimated at 60.20 billion Botswana pula (5.63 US dollars). Total expenditure is estimated at P67.54 billion, resulting in a budget deficit of P7.34 billion (0.69 US dollars) or minus 3.5% of GDP (Matambo 2019).

Nigeria faces the same problem of a monocultural economy that leads to revenue concentration. In the face of price shocks in the oil markets, particularly post-2007, revenue concentration, mainly due to the dominance of oil revenues, means that delivering on the social compact is challenge. Outside Africa, oil-producing states, comprising of Saudi Arabia, Kuwait, the United Arab Emirates, Qatar, Bahrain, and Oman, are faced with the same of problem of monocultural economies and revenue concentration. However, there are efforts to diversify the economy away from the oil sector (Alreshan et al. 2016).

## Fiscal Strictures Post-2007

As stated above, while some monocultural economies, for example, Botswana, were able to deliver on the social compact, post-2007, things are different. Due to cutback management, social goods and services face the danger of either reduced funding or defunding. As an example, due to fiscal strictures, there has been renewed calls for either cost sharing or cost recovery in Botswana in sectors such as tertiary education financing. Hence, learners and parents are being asked to help the government with the cost of financing tertiary education. In a similar vein, government-sponsored tertiary institutions, for example, University of Botswana, are being asked to explore alternative sources of revenue.

The same problem is seen across Africa and the #FeesMustFall protests in South Africa are instructive. The South African economy is largely driven by the mining sector, particularly, gold. With the crisis in the mining sector post-2007, the provision of social goods and services has come under stress as the #FeesMustFall protests amply demonstrated. The #FeesMustFall crusade was a student-led protest movement that began in mid-October 2015 and effectively ended in 2018 after the Jacob Zuma-led government announced that beginning in 2018, there will be free tertiary education. The overarching goal of the protest was two-pronged: (i) stop increases in student fees and (ii) increase government funding for tertiary institutions. The protest shone the spotlight on cutback budgeting post-2007.

A similar challenge is being experienced in the public health sector. To illustrate, while antiretroviral (ARV) medication has been freely provided in public health facilities since 1992 and Botswana was the first country in Africa to freely provide ARV medication, there are muted calls for either cost sharing or cost recovery in the provision of ARV medication. In a similar vein, on 29 March 2017, the Ministry of Health and Wellness issued a savingram titled *Removal from medical cover for self-inflicted harm*. The objective of the savingram was to exclude medical cover for self-inflicted harm. In the wake of public opprobrium, the government suspended the policy to allow it to consult all stakeholders before the policy could be reintroduced in the future. At the time of writing this book chapter (6 March 2019), the savingram is yet to make a comeback to the

arena of public policy. All the same, it is deducible from the foregoing cases in the public health sector that pressures on the public purse result in cutback budgeting. Vital to note, the cases as cited in the foregoing find replication beyond Botswana due to fiscal strictures in monocultural economies, so, necessitating revenue diversification, particularly given post-2007 challenges.

## Actualizing Revenue Diversification

It is deducible from the foregoing that monocultural economies pose fundamental fiscal problems, particularly in sub-Saharan African countries (oil-dependent Nigeria and diamond-dependent Botswana being poster children of problems associated with monocultural economies). These problems assume dangerous and disastrous dimensions post-2007. Therefore, this calls for a paradigm shift in regard to revenue bases. It is notable that some developing countries are on the road to revenue diversification. Gulf oil-producing states, comprising of Saudi Arabia, Kuwait, the United Arab Emirates, Qatar, Bahrain, and Oman, are already on this path. For example, by 2015, negotiations of two Gulf Cooperation Council agreements on value-added tax (VAT) were in full swing, and some countries have considered or have already introduced other type of taxes and fees (Alreshan et al. 2016). Some sub-Saharan states are also on this path. For example, in Botswana, one of National Development Plan (NDP) 11's (2017/2018–2022/2023) priority areas is "development of diversified sources of economic growth and revenues." In a related vein, in 2009, Botswana introduced the Economic Diversification Drive. The Economic Diversification Drive aims to diversify the economy by developing sectors other than the primary sectors (read diamonds) so that they materially contribute to the gross domestic product. In a similar vein, Nigeria, an economy which is heavily reliant on oil and also experiencing falling prices, has turned to agriculture. On the whole, while there are efforts to diversify revenue sources in sub-Saharan African countries, particularly post-2007, there is no linear relationship between policy outcomes and policy outcomes. Therefore, there is a need for a conducive environment that will aid the delivery of this initiative. Next, some of the initiatives are discussed.

(i) *Political will*: revenue diversification, like any other fiscal reform, needs to be supported from above, especially from the first office. Therefore, political will must flow from the first office. In the absence of political will, all and any reform will fail. In a related vein, there is a need for a champion for fiscal reform. The experience from many countries is that when either the head of state or government is appointed the champion of a reform initiative, there is a high probability that the same will be successful. Hence, there is a need to have heads of state and/or governments at the forefront of fiscal reforms such as revenue diversification. This will ensure that resources and support are availed to the initiative.

(ii) *National consensus*: while monocultural economies and revenue concentration may seem like academic debates, ordinary citizens feel the same in the face of cutback management. Therefore, for fiscal reforms such as revenue diversification to succeed, there is a need to build a national consensus around the idea. That is, there is a need to inculcate into the minds of the citizens the disastrous dangers of monocultural economies and revenue concentration. For instance, while it is widely believed that "diamonds are forever" (meaning that they are durable, hence have ever lasting quality), it is opportune to change the message to "diamond revenues are not forever" so that Botswana (i.e., citizens of Botswana) wholly understand that diamond revenues alone cannot guarantee the economic viability of the state, hence the need to embrace the ideal of revenue diversification.

(iii) *Capacitating tax administration authority*: revenue diversification is firmly predicated on efficient and effective tax administration authorities. On the whole, revenue authorities are freighted with problems such as poor

resourcing (finance and staff) in sub-Saharan Africa. This compromises their ability to collect tax such that tax effort is poor. Therefore, there is a big wedge between actual collection and taxable capacity. Therefore, there is a need to capacitate tax administration authorities.

(iv) *Expanding the tax base*: a majority of sub-Saharan African countries have very narrow tax bases. Therefore, they can raise more tax revenue without raising the tax rate (a not so politically feasible thing to do in polities characterized by clientelism). Therefore, there is a need to expand the tax base. For instance, in Botswana, the cattle industry, although heavily subsidized by the state, is beyond the reach of the tax administration authorities. Similarly, in many parts of sub-Saharan Africa, there are lots of sacred cows that are beyond the reach of tax administration authorities. So, there is a need to tax erstwhile sacred cows in order to boost total tax revenue.

(v) *Illicit financial flows*: sub-Saharan African countries lose billions of dollars to, among others, illicit financial flows. According to *Illicit Financial Flows, the economy of illicit trade in West Africa*, published by the Organization for Economic Cooperation and Development on 20 February 2018, Africa loses an average of $50 billion every year. The $50 billion means lost goods and services and also poor health and nutrition and preventable death and stunted development. Therefore, there is a need to plug these illicit financial flows to increase total government revenue.

There are many initiatives that can be employed in the services of the cause of revenue diversification. Even if the foregoing initiatives can be employed, together with cognate initiatives, these will amount to naught if they are not accompanied by fiscal transparency and accountability. Transparency and accountability are key with regard to financial management. Fiscal transparency assumed pride of place in public finance in the wake of the Asian financial crisis of 1997. In this regard, multilateral organizations such as the International Monetary Fund (IMF) and Organization for Economic Cooperation and Development (OECD) issued codes on fiscal transparency. The IMF first published its Code of Good Practices in Fiscal Transparency in 1998, and the OECD issued its Best Practices for Budget Transparency in 2002. In a related vein, the International Budget Partnership started publishing Open Budget Surveys in 2006. The Open Budget Survey is the world's only independent, comparative assessment on transparency, oversight, and public participation.

It is notable that many sub-Saharan African countries fail both IMF's Code of Good Practices in Fiscal Transparency and the OECD's Best Practices for Budget Transparency. In a related vein, they fail the International Budget Partnership's Open Budget Surveys. The worst performers on budget transparency are found in sub-Saharan Africa. According to the Open Budget Survey 2017, the average Open Budget Index score fell from 45 in 2015 to 43 in 2017 for the 102 countries surveyed. It is notable that one of the key drivers of the decline was due to reversals of previous gains. In this regard, in sub-Saharan Africa, of the 27 countries included in both the 2015 and 2017 surveys, 22 saw their transparency scores fall in 2017 (International Budget Partnership 2017). Therefore, for fiscal reforms such as revenue diversification to bear fruit, there is a need to improve fiscal transparency in sub-Saharan Africa. Sub-Saharan Africa must benchmark from the IMF, OCED, and International Budget Partnership on the ethic of fiscal transparency. Also, there is a need to pass the Right to Information Act to extract disclosure from the executive arm of the government.

In a related vein, fiscal accountability is key. The citizens and government have a principal-agent relationship. Therefore, the agent must fully account to the principal. In sub-Saharan Africa, this principle is honored in the breach than in the observance. Government officials often hide behind the veil of secrecy and, thus, do not feel obligated to tell the citizens how they spend their money. It is imperative that the government (read the executive arm of the government) must appreciate the dictates of the principal-agent relationship and fully account to

the citizens. Among others, this will entail the publication of periodic budget reports. In this regard, there should be sanctions on ministerial accounting officers (in many sub-Saharan African countries, these are either permanent secretaries or cabinet secretaries) for failing to provide the treasury with requisite data to produce budget reports.

Finally given that the executive arm of the government is often loathe to be fiscally transparent and accountable to the citizen, non-state actors must step in. Therefore, through lobbying and advocacy, they must exact fiscal transparency and accountability from the government. They must also produce citizen scores on fiscal transparency and accountability which they can use as empirical evidence to back their claims of low or poor fiscal transparency and accountability. In a related vein, they must cultivate working relationships with the legislative arm of the government which they can enlist in their quest for increased fiscal transparency and accountability.

## Conclusion

Efficient and effective governments are firmly predicated on the availability of adequate resources. Among others, adequate resources will very favorably circumstance the state to deliver on the social contract, including the provision of social goods and services. To deliver on the social contract, there must be adequate resources. The reality is that many sub-Saharan African countries are characterized by monocultural economies. Due to monocultural economies, there is revenue concentration as opposed to the desired ideal of revenue diversification. Monocultural economies are susceptible to vagaries such as global economic crises. In the face of such global economic crises, as happened in 2007 with the onset of the global financial crisis, their single export commodities (e.g., Botswana's diamonds and Nigeria's crude oil) faced declining prices in international markets. This, therefore, led to reduced fiscal envelopes. On the whole, reduced fiscal envelopes compromise the state's ability to successfully deliver on the social contract, including the provision of social goods and services. The failure to successfully deliver on the social contract has many and disastrous consequences such as diseases of poverty. In addition, failure to successfully deliver on the social contract can lead to social strife as instanced by service delivery protests. Therefore, post-2007, there is a need to intensify revenue diversification efforts. Revenue diversification efforts must be accompanied by fiscal transparency and accountability. Lastly, non-state actors, in the form of civil society, can be very useful in exacting fiscal transparency and accountability from the executive arm of the government.

# Revisiting Quota System in Civil Service of Pakistan

Naila Saleh
Department of Public Policy, Pakistan Institute of Development Economics, Islamabad, Pakistan

## Synonyms

Meritocracy; Quota system; Regional quotas

## Definitions

Quota system refers to policy of hiring/admitting a specified percentage of group members on the basis of a predetermined criterion. Recruitment into civil service of Pakistan are determined through regional quotas where specified seats are allocated on basis of provincial quotas to ensure proportional representation of all provinces. Whereas meritocracy to the contrary ensures allocation of services purely on basis of merit and talent.

## Introduction

Effective labor force is the key to an efficient sector. Recruitment practices of a country play significant role in creation of efficient labor force. Human capital is one of the primary resource that contributes to success of an organization whereas it has to be identified at the stage of recruitment (Chandan 1997). Therefore, the foundation structures of an organization such as fair and competent recruitment practices play key role in attracting competent candidates. Meritocracy in organizations can incentivize people for reaching up to their fullest potential. A whole set of research claims positive correlation between meritocracy and economic growth. The 1997 World Development Report asserted that "Meritocracy in the civil services can help in ensuring recruitment of high-quality staff and can do a great deal to increase efficient performance of public entities." (Banque Mondiale 1997, p. 92).

Civil service in any country is the backbone of the government. It formulates and implements core national policies. To cope with the modern day challenges, civil service needs to be modernized. Meritocratic recruitment can be one way of promoting effectiveness of the service.

Public sector of Pakistan is a major source of employment generation. The authority for recruitment in public sector of Pakistan at federal level is Federal Public Service Commission (FPSC). FPSC allocates jobs in the central public services and civil service on the basis of provincial quotas and merit. According to the recent recruitment policy, only 7.5% allocations are made on the basis of merit in the civil service (see Table 1).

Quota system in civil service of Pakistan is a major setback to efficient performance. Regional quotas were introduced for promoting equal representation of all provinces in the country. The 1973 constitution while introducing regional quotas fixed a 10-year period for it and the system was adopted for short run. The subsequent governments in 1980s further extended it to 40 years which were to be expired on August 13, 2012. But the government has decided to carry on with it. Continuing with the quota system without assessing its implications can impede the efficiency of public sector in long run.

Civil service of Pakistan lacks dynamism and efficacy as a consequence of regional quota system. There are serious shortcomings of quota system which are worth consideration. Quotas in service sector are criticized for undermining the very spirit of meritocracy. Quota system is

**Revisiting Quota System in Civil Service of Pakistan, Table 1** Quota of different provinces in civil service of Pakistan

| | |
|---|---|
| Merit | 7.5% |
| Punjab | 50% |
| Sindh rural | 11.4% |
| Sindh urban | 7.6% |
| Khyber-Pakhtunkhwa | 11.5% |
| Baluchistan | 6% |
| Azad Jammu and Kashmir | 2% |
| Gilgit-Baltistan and FATA | 4% |

particularly criticized for promoting heterogeneity and institutionalizing ethnic divisions in the society. Quotas in service sector reduces probability for growth and increases corruption.

Good governance can be ensured through efficient civil service. Skilled labor force is the key to provision of quality services. Management of public service can be improved through competent civil service (Schiavo et al. 2000). A meritorious and efficient civil service is the need of hour and thus shall be prioritized by government through shifting toward a more competent and meritocratic labor force.

## Status of Quota System in the Civil Service of Pakistan

At the time of independence, Pakistan inherited a bureaucracy which was extremely authoritative. Being a part of bureaucracy was considered necessary for securing representation of the people of one's own ethnic group. Quotas were perceived as temporary but necessary remedy given the strong ethnic consciousness among people as well as keeping in view the level of uneven development in different provinces. So, ethnic diversity and interprovincial institutional disparities were two fundamental ingredients behind the introduction of this system.

Regional quotas in the country were thus introduced for accomplishment of two contradictory principles: Compensation to people of backward regions and proportional representation of all provinces in the bureaucracy. Quota system was launched with the rationale of ensuring equal participation from all provinces in the public service in accordance with their population. It was considered necessary for recruitment of people from backward regions who otherwise would not have been able to compete with candidates belonging to well-off provinces and were equipped with better educational abilities.

The origin of quota policy can be traced back to 1949. At that time, 20% of the vacancies were filled on the basis of regional quotas and 80% recruitments were made on quota. The quota policy got the status of statutory exception to the "non-discrimination clause" in the 1956 constitution. With the passage of time, this system also made its way into other public departments. Despite its rationale of addressing ethnic grievances, it failed to keep Pakistan from dismemberment and in 1971 Bangladesh made its appearance as an independent state on the map of the earth.

In 1973 the weightage given to merit versus quota was revised. The ratio of merit was further reduced to 10% under the new constitution. Following the precedent set by federal government, provincial governments followed suit and introduced their own quota-based formulas for recruitment. The quota system which was envisaged as a temporary remedy later on made its extension not only into other federal public services but also provincial services. Currently recruitment unto any federal or provincial service is subject to mentioned formula of quota versus merit.

Though this system was envisaged as a short-term measure yet because of inefficient performance by federal and provincial government in upgrading the backward regions, the government had no option but to continue with it. The real dilemma in Pakistan is not only the quota system but also the design of the quota system. In the civil service of Pakistan, only 7.5% of the recruitments are made on merit whereas the rest are recruited on basis provincial quotas.

Sixty years since the introduction of quotas, dualism and regional disparities still exist. Compromising on the quality of services and undermining the spirit of equality of opportunities (one of the basic fundamental right) for so long without attaining regional parity, this system has proved as a huge failure.

Speaking legally, quotas violate the principle of equal opportunity as envisaged by Islam. It has been declared illegal by Federal Shariat court on the ground of its discriminatory spirit. "Article 27 of the constitution had provided safeguards against discrimination in services on grounds of race, religion, caste etc." So it is also violating the spirit of our constitution.

Quota in recruitment can demoralize deserving candidates. Chances of recruiting underqualified civil servants is one big disadvantage of this

system. Furthermore, frustration of deserving applicants can result in brain drain. This system can lead to political intervention in the administration of the service as quotas are mired in manipulation and corruption. Another major drawback of quotas is that it cannot be fully utilized as many posts in the civil service remain vacant due to lack of qualified candidates.

Quota can work efficiently only if it is accompanied by measures which attempts at addressing the institutional constraints for addressing regional disparities. Quota system in Pakistan has failed in remedying the very cause which led to its introduction. So continuing with Quotas without achieving the real purpose of ensuring actual equity will only end up in an inefficient public performance. This policy fails to incentivize the provinces for undertaking educational reforms in their jurisdictions.

## Meritocracy: Key to Effective Public Administration

The public welfare of whole population can be optimized by employing ablest people in a service. Meritocracy is globally considered the key to a fair system attempting at producing better outcomes for individuals as well as society. It can serve as a vehicle for social mobility and incentivize people for reaching their fullest potential.

A whole set of research and empirical studies exists which highlights the importance of meritocracy in the civil service sector of a country. Meritocracy is associated with high economic growth and high efficiency. A study by Evans and Rauch (1999) shows positive correlation between meritocratic recruitment and economic growth. Meritocratic recruitment along with competitive salaries significantly reduces corruption (Dahlström et al. 2012). Professional bureaucracy creates separation between bureaucracy and politicians thus reducing corruption in the long run. Similarly, merit-based recruitment leads to rewarding career ladders which significantly improves the performance of civil servants. Merit-based system attracts outstanding human capital and results in better public management. A recent report by UNDP emphasizes the importance of merit-based civil service on the grounds of effective service delivery and efficient performance (UNDP 2011).

Politicization of civil services can undermine neutral and meritocratic performance. Inequality is a problem for both the developing and developed countries. Inequalities in the service can be promoted by eroding equality of opportunity. Through the promise of opportunity, meritocracy can be used as a tool for ensuring inclusive recruitment. Quota at times can be considered as denial of equal opportunity as in 2013 civil service exam takers in Bangladesh took to the streets against the country's quota system for entry into the civil service of the country. Meritocracy promotes equal opportunities for advancement. Efficient civil service is output of merit-based recruitment along with timely training. Quality human capital should be the main focus of recruitment organization (Yesmin 2010).

## Recommendations

Quota system can be termed as a necessary evil in Pakistan if analyzed objectively. It is one major cause of the decline in quality of civil service. In the wake of the strong existing dualism, quota system cannot be eliminated completely. The government should revisit the policy and redesign the weightage as well as the criterions on which quotas are based.

1. It is time to create balance between merit and quota.
2. Internationally, quotas are used for ensuring participation of the underprivileged and marginalized groups of society. Whereas in Pakistan, quotas aim at ensuring participation of provinces in accordance with their population. It is unintentionally used as a tool for promoting racism. The criteria for determining quota merely on basis of population needs to be amended. In the current system, Punjab which is the most advanced province gets 50% share in quota. Whereas backward provinces like Baluchistan's share stands at barely 6%. The very rationale of quota, i.e., ensuring participation of underprivileged, is undermined when

other indicators like backwardness of region are not taken into account. Instead of cumulative provincial quotas, regional quotas should be introduced where seats shall be reserved for backward regions only.

3. The beneficiaries of provincial quotas are mostly well-off classes of the provinces. They hold domiciles of backward provinces but do not in any way fall in the category of people who are victim to institutional disparities. Instead of competing on a level playing field with those from advance regions, they get the allocation on basis of their place of birth and not on criterion of competition. While recruiting people on reserved seats, it shall be ensured that applicant does actually lie in the category of those people who are unable to compete with applicants from advanced regions.
4. One of the dilemmas in Pakistan is the existence of a dual setup of educational institutes. One major difference between this dual setup is the inability of students from backward institutes to be well-versed in English. At times very competent people fail to make their way unto civil service of Pakistan because of language constraint. Relaxing the criterion of English would be a better option for ensuring both equity and meritocracy.
5. Quota system can be more useful in short run when educational, economic, and political conditions of a province could not be repaired or improved. Improving education and economic setup should be the objective for a long-run policy. Provision of quality services such as standard and quality education and health is a more pragmatic approach for plugging regional disparities and enhancing inclusive growth. So a limited and clear timeline shall be set for it and after the expiry of that timeline it should stand abolished.

## Definition

Revolution is defined as any kind of regime change that does not take place in line with the constitutional rules of the respective legal entity, may it be peaceful or violent.

## Introduction

The insight that politics and administration should be treated as separated spheres is not new, as already Wilson portrayed administration as the apolitical execution of law. Consequently,

even if the spheres are distinct, there is no politics thinkable without administration to execute. However, as argued by Peters (2018: 164), "this presumed separation of administration and politics allows them [bureaucrats] to engage in politics."

While the consequences and causes of revolutions for political systems and the economy are at the forefront of debates in the respective disciplines, scholars have paid scant attention to the role of bureaucracies in revolutions. Against this background, this entry maps the efforts of public administration theory to come to grips with what is understood as revolution. As public administration is of utmost relevance in the context of revolutions, and the scope of the role of administrations in revolutions can be manifold, they may be the passive recipient of change, may influence developments actively, or may be more or less unaffected by a change of the political system.

This entry conceptualizes which potential positions in revolutions can be taken by the public administration and which consequences revolutions have for the bureaucracy from a theoretical viewpoint and provides humble empirical evidence of administrative behavior in revolutions worldwide.

## Which Revolution?

A revolution is defined as a – forcible or peaceful – overthrow of an existent government or social order, in favor of a new system. Any kind of regime change that does not take place in line with the constitutional rules of the respective legal entity can be understood as a revolution, even if in common usage the term is associated with some kind of violence, and actions that are not merely carried out by a small elite only, but include a larger part of the public, at least as supporters. As a subset of revolution, a coup d'état can be understood, which implies an elite-driven action, in detail "illegal and overt attempts by the military or other elites within the state apparatus to unseat the sitting executive" (Powell and Thyne 2011: 249).

The term "revolution" also can mean an instance of revolving. The latter definition is close to the origin of the term – the Latin word "revolutio" indicates for any kind of rollback. Hence, a revolution can also be a rollback toward a system of any kind that has been in place before – revolution by no means always implies the change toward a completely new system. In that sense, revolution per se is a non-normative term, just indicating for a relatively radical change. Hence, the term revolution per se does not imply a "revolution to the better," toward a system which is normatively in line with current democratic principles as accepted by countries in the European Union or other Western countries. On the contrary, a revolution can be any ideological change of the present system – being it from an autocracy to a democracy or vice versa. Hence, it also may lead to a more authoritarian regime or mark a change from one authoritarian regime to another, as, e.g., often discussed for the case Iran in 1979 or for the "Arab Spring" in 2011. Thus, analyzing revolutions, the impact of the radical change per se ("procedural dimension") has to be clearly separated from the impact that originates from the normative goal of the revolution, e.g., the introduction of democracy ("outcome dimension").

Independent of the concrete motive of action, revolution, terrorism, and social unrest are discussed as having a negative impact on the affected society, as they harm economic growth and development and result in the destruction of human and physical capital, as well as a decrease in international trade and foreign direct investment (see for others, e.g., Barro and Sala-I-Martin 1994). Furthermore, on a societal level, these events may lead to a decrease in life satisfaction for citizens, as it is a cause of anxiety and uncertainty.

Hence, applying the "procedural" dimension as the analytical framing, it could be stated that revolutions per se are harmful. Nonetheless, even at this stage, a more precise distinction is useful: focusing on peaceful revolutions, where the effects as outlined above are only in place very short-termed, if at all, and the overarching goal

is perceived as positive by most of the people inside and outside the country, the negative immediate effect or aftermaths may be very limited. Violent revolutions, on the other hand, even if the "outcome effect" is anticipated to be positive by the domestic people, or the rest of the world, may enfold the negative effects more intensively.

Applying the analytical framework of the "outcome dimension," the approached final state after the revolution process is of relevance. Distinguishing between revolutions toward more democracy and forms that aim to install other regime types or societal orders, it is likely that the first form will find the support of much of Western countries, as well as of transnational nonprofit organizations and international organizations, which follow a "democracy paradigm" in distributing financial or technical resources in development aid. Thus, democratic revolutions are likely to be perceived as being positive, in particular from the international sphere, so that the negative effects as delineated above are less likely.

Furthermore, revolution, even if the term is commonly used that way, by no means automatically implies a radical one-step shift of the whole system. It also can be a kind of creeping revolution, affecting specific societal, political, or administrative levels earlier than others. At this point, it is important to differentiate the term "revolution" from what is called "democratic backsliding" or "authoritarian backsliding" and "transition."

In many cases in particular democratic systems are not breaking down because of violent coups or revolutions but induced by slow changes that deteriorate the quality of democratic norms and practices (Waldner and Lust 2018), while revolution implies at least a partial ignorance of the constitutional principles for the regime change itself, and some kind of comprehensive change within a short period of time, backsliding, following the definition of Waldner and Lust, is a "discontinuous series of incremental actions, not a one-time coup de grâce" (2018: 95) and can be in line with constitutional principles. Overall, it is a top-down process during which authoritarian leaders or governments redesign fundamental characteristics of the state and its bureaucracy. The phenomenon implies a decline in what is usually perceived as "good governance" – transparency and the rule of law, respect of human rights, and corruption control – and gives space to a reversal of reforms and the overall the rise of an anti-liberal discourse (Peters and Pierre 2018). Hence, the phenomenon of democratic backsliding has to be recognized in this context, even if it is only allied to the definition of revolutions as outlined above. Nonetheless, being understood as a "deterioration of qualities associated with democratic governance, within any regime" (Waldner and Lust 2018: 95), democratic backsliding implies many of the consequences of anti-democratic revolutions – in particular when it comes to the potential effect on the public administration.

Transition in this entry is understood as the change that happens subsequent to a revolution, no matter if it was a peaceful or violent one, and therewith can be defined as an outcome, but also an extension of the revolution. What distinguishes transition processes in the aftermath of a revolution from other public sector reforms is the scale and intensity of the systemic change involved, as after revolutions, the reform trends must penetrate to the fundamental rules and values that shape behavior and guide organizations. Revolutions and the subsequent transition processes request "a wide-ranging, comprehensive set of reforms," not just "a more restrained, incremental program of change" (Cepiku and Mititelu 2010: 62).

Based on these delineations, to take stock of the phenomenon of revolution in the context of public administration, a wider approach that defines revolution as any kind of regime change that does not take place in line with the constitution of the respective legal entity, but comes relatively sudden, and leads to a comprehensive change of the political or societal system within a comparatively short period of time, the transition period, is adopted.

## Why Do Administrations Matter in Revolutions?

Where do revolutions have their origin? The causes of revolutions can be manifold. Ideology that cannot be implemented by other measures, e.g., in the context of an electoral process, is among the explanations as well as societal features on the macro-level as, e.g., poverty or inequality or individual factors as discontent and relative deprivation, respectively (see for others Gurr 1970). Following the literature, the incumbent state leader, political or administrative elites, opposition protesters from the society, or single individuals can start a revolution – even if the likelihood for the revolution's success may differ depending on its origin. Hence, public administration may be focused on as both, the recipient of a revolution (dependent variable) and the initiator (independent variable). Consequently, both scenarios are discussed theoretically and with a view on empirical evidence in this section.

Without a professional (and at least somewhat impartial) state administration, political, economic, and social transformation – may it be caused by elections or a revolution – is unlikely to succeed, as "bureaucracy is the core of modern government" (Frank 1966: 725). This is in particular true for developments toward more democratic systems – for the transformation from an authoritarian regime to a liberal democracy with multiparty system, it is fundamental to establish a market economy, lower the level of corruption, introduce and maintain a sound regulatory framework for businesses, implement the rule of law, and, finally, build trust in civil society and legitimize the new governmental and governance structures. But also the development vice versa – from a democracy to a more authoritarian regime (or from one authoritarian regime to the other) – requires a functioning administration. Overall, "bureaucrats will be expected to assist the process of reorganization" (Frank 1966: 725), whereas, initially, their expertise is needed to perpetuate the daily services and keep the government in operation, while the new policies are still in the making. As the public administration constitutes the "government" through the eyes of the public, to channel the public opinion, or to ensure citizens' cooperation, on the path from transition to establishment, the revolutionary government may be willing to replace existing bureaucrats and structures. In any case, it is plausible to assume that to overcome the legacies of the former regime is related to specific challenges for the new government and that the public administration plays a pivotal role in this process. Specific focus areas can be identified as central elements of reforms in that context, in particular strategic planning and coordination across the bureaucracy, a stable and sound financial and budgetary management, and the management of human resources (Cepiku and Mititelu 2010).

So far, an overarching "theory on PA and revolution" in the narrow sense does not exist. The PA-related literature that touches aspects of the topic spreads over a very wide range of issues and geographical areas, and it employs an equally broad range of research strategies and concepts. Hence, much of what can be perceived as research on the role of bureaucracy in times of revolution is more a bycatch of political science and transition economics (for an exception see, e.g., Farazmand 2001). The most elaborated branch of literature is the one on transitions in the aftermath of the revolutions in the former Soviet Union, and large parts of Eastern Europe, but also South Asia, a more current path of research focuses not on revolutions in the narrow sense, but on "democratic backsliding." Revolutions in narrow terms were addressed primarily as analyses of military coups or in the context of the developing countries, e.g., the Iranian Revolution in 1979 and the Arab Spring in 2011.

Research on driving forces within processes of revolutions or democratic backsliding mainly focuses on changes of the political system or the society, thus having a strong focus on the principal of the first or second order. The bureaucracy as the agent is sparsely addressed, and if, mostly as the dependent variable. Also the lion's share of the transition literature tackles the PA as the passive recipient of

reforms, even if, overall, "no agreement is found in the literature on the scope, contents and sequence of PA reforms in transition countries" (Cepiku and Mititelu 2010: 62).

## Scenarios of Administrative Action and Reaction

A convolute of literature addresses the question of how individuals react to framework conditions which do not fit their individual utility function. One of the most popular approaches to explaining the different choices is the model of "exit and voice": According to Hirschman (1970), there are two general options for an individual to cope with their discontent with the institution they belong to – either they can voice their complaints in order to change the system or they can exit the system (if the exit costs are not prohibitive for personal, legal, and/or economic reasons). This choice is a general one and may be made regardless of whether the "system" is a public body or a different institution.

One key question in this context is: Under what conditions one option will prevail over the other option? What determines the individual's choice? In this scheme, exit and voice can be seen as two contrasting but "not mutually exclusive categories" (Hirschman 1970), as there may be other reaction options – such as doing nothing and acting loyal to the system.

The scheme outlined above can be applied also the role of administrations or single public officials in revolutions. It is, therefore, suitable for our analysis on two levels: it can be applied on the first level – the question if a revolution is started by the bureaucracy or not – as well as on the second level that is related to the question how the bureaucracy reacts in detail if being exposed to a revolution.

Overall, there are different scenarios the public administration can be affected by a revolution of what kind ever.

1. PA can induce revolution.
2. PA can be exposed to a revolution and react.
   (a) Reaction can be resistance, resilience, or sabotage against the new system (in the following used as "negative reaction").
   (b) Cooperation, loyalty, and work with or for the new system (positive reaction).
3. PA can be exposed to a revolution and react not; the consequence would be shirking or exit (in particular modeled as estrangement or "inner emigration").

The first case assumes the PA to be the independent variable; the latter cases model the bureaucracy as the dependent variable. Following this classification, the overall discussion about the possible role of PA is closely linked to the anthropology of the bureaucracy. In particular the assumption of neutrality of the administration is at stake here, but also potential policy preferences of the bureaucracy, as the ideal of the bureaucracy as a neutral agent of the principal, the political level, cannot be assumed. Hence, how can be determined which role is the administration likely to choose?

As for public administration as a discipline, two anthropologies are used to explicate administrative behavior: logic of appropriateness (LoA) and the logic of consequentiality (LoC). The striking difference between these two anthropologies is that the LoA focuses on the process (rather than the outcomes) and the role of institutions within the process, while the LoC, reflecting preferences and estimated utilities of the individual, is at least implicitly more oriented toward the outcomes (March and Olsen 2004).

Following the logic of appropriateness, one would adopt the position either (a) that the bureaucracy is a neutral agent, following the rules that are determined by the political level (the principal), or (b) that bureaucracy as a whole follows what can be described as the value system of the public administration. This may – depending on the historical path of a country – be democratic or undemocratic.

As for (a), the first case, a revolution induced by the PA may not be very likely. As for (b), the second case, the *action of the PA toward a revolution* or the *reaction on a revolution* may depend on the political system ex ante and direction of

the revolution: If there is a democratic tradition or democratic values anchored in the PA, it will induce a revolution or cooperate with the revolutionists once they approach a turn toward more democracy; otherwise they will resist or oppose any kind of change toward more democracy. The same can be assumed for any case of value system, may it be related to religious leadership, single-leader focus, a Soviet system, etc. Furthermore, revolutionary processes may vice versa induce changes in the system of appropriateness, as "processes of search and change may also be triggered when an existing order, its institutions, rules of appropriateness and collective self-understandings, are challenged by new experiences that are difficult to account for in terms of existing conceptions" (March and Olsen 2004: 15). Following this approach, the likelihood that the PA induces a revolution or cooperates with the revolutionists would be relatively easy to predict by the magnitude of the gap between the value system and the revolution's aspiration, as "civil unrest, demands for comprehensive redistribution of political power and welfare, as well as political revolutions and major reforms often follow from identity-driven conceptions of appropriateness" (March and Olsen 2004: 7).

The logic of consequentiality implies that the individual bureaucrat will follow its own utility in terms of acting rationally, based on the notion that actors seek to maximize their interests based on consistent and stable preferences. This follows the logic of principal-agent theory, which assumes opportunistic behavior of actors: ex post opportunism as moral hazard and ex ante opportunism as adverse selection are likely (Lane 2007). In this model the overall exchange relations between principals and agents are characterized by permanent information asymmetries and ambiguity and uncertainty between agent and principal. These forms of opportunism are rooted in a rational actor model which is built on the notion that the agents strive to maximize their interests based on consistent and stable preferences – an idea implicitly linked to the LoC.

Hence, following the LoC, the bureaucrat would induce a revolution only if the expected value of regime change is positive for his own utility. Cooperation with the new regime ex post to a revolution also would follow the individual rationality and the expected individual benefit from this behavior. Obviously, following this anthropology, the likelihood that a revolution is induced by the public administration is less predictable as it depends on the unknown individual (expected) utility.

While this micro-foundation of administrative behavior is clearly of relevance if it comes to explanatory patterns for revolutions or bureaucratic reactions to revolutions, there is no clear-cut consent in literature which approach to follow. Hence, this entry takes both options into consideration.

## Public Administrations as the Drivers of Revolutions

Hirschman's (1970) scenario about exit, voice, and loyalty implies that the bureaucracy can induce a revolution or conduct a coup d'état. The revolution can be seen as a kind of "voice of discontent" in that case, in particular if the other options are not (longer) possible. While there is solid evidence that the military or more general security forces are the driving force of revolutionary change relatively often (e.g., in Egypt 1952, Turkey 1960, and Chile 1973, to name only some), there is little evidence that other parts of the bureaucracy actively induced revolutions. Furthermore, there is no evidence that military coups do lead to a different reaction pattern of the bureaucracy, compared to other revolutions: in some cases the bureaucracy was relatively resilient against change, and in some cases it was coopted or cooperated with the new regime. Altogether, there is no clear pattern that revolutions induced by the military are perceived as "more valuable" by the bureaucracy as a whole and therewith are supported to a larger extent.

## Public Administration as the Dependent Variable

In this scenario, the PA is hit by a revolution and the subsequent political and societal change. The impulse set by the political level can be modeled in various ways. While one option is to

coopt with the pre-revolutionary bureaucracy, leaving its structure and processes more or less untouched (as, e.g., in the beginning of the revolution in Germany 1918), the likelier effect is that the revolutionists will tackle the administration's structure, resources, or norms to induce change in line with the revolutionary goals. In this case, different tactics may be used for changing – or at least trying to change – public administration (see Bauer 2018; Peters and Pierre 2018):

- Redistribution of resources and budget reforms as a precondition for future reforms (Guinn and Straussman 2015: 269)
- Restructuring of the administration as a whole

These measures are likely to occur, no matter of which kind the revolution is, toward more democracy or toward an authoritarian regime. However, there are measures that are particularly expedient – and therewith likely to be undertaken – only in anti-democratic revolutions or after a revolution substituting one autocratic regime by another autocratic regime with a very different ideology (see Bauer 2018: 17):

- Attempts toward the centralization of administrative structure
- Measures toward cleansing of administrative personnel and extensive patronage in recruitment and career progression and therewith the politicization of the civil service
- Cutting back of societal participation and means of external control not least by to ensure loyalty to the revolutionary ideology and/or the revolutionary government
- Devalorization of traditional administrative norms (in particular the norm of neutrality)

Prodemocratic revolutions may result in opposite behavior of the political level against the bureaucracy. Furthermore, specific other measures of more long-term orientation may be undertaken. For example, in particular in post-socialist countries in Central and Eastern Europe (CEE) after the revolution, at the outset of transition, measures included downsizing aimed at achieving fiscal stabilization, the shift of resources from the state to the private sector, and structural measures to increase administrative efficiency, including retrenchment of civil service (Cepiku and Mititelu 2010). Furthermore, in particular in post-conflict, fragile states, specific types of reforms that affect the bureaucracy have to be accomplished, before administrative reform in the narrow sense may take place, in detail "(1) restoring legitimacy, (2) establishing security, and (3) building government effectiveness" (Guinn and Straussman 2015: 265).

Whatever the concreate measures may be – if these attempts turn out to be "successful" (from the viewpoint of the revolutionary forces) – depends on the impulse given by the revolutionists and the reaction of the public administration.

Apparently, the resources available to the revolutionist government decisively determine its ability to induce and execute changes in the bureaucracy as delineated above. While financial resources to support the pro-revolutionary adaptions and reforms of the administration are of obvious importance, also the availability of appropriate substitutes to replace the existing public personnel is of relevance (Frank 1966). Furthermore, time matters, as the post-revolutionary transition cannot be accomplished within a few month or years, given inter alia long-term contracts in the administration or the relevance of path dependencies in bureaucratic structures. Hence, if counterrevolutionary movements come to early, pro-revolutionary attempts for administrative change will remain uncompleted. Beyond these factors attention itself can be modeled as a resource: if the revolutionist government focuses on its political priorities and ideology, it may not care about (or have the capacity) to oversee other tasks of government.

Furthermore, the degree of change or the similitude of the pre-revolutionary and post-revolutionary regime seems to be of utmost importance: if the revolution brings only minor de facto change with a view on values and rules, e.g., if former ruler-centric values are not affected by the revolution, but only the ruler itself is substituted, a profound change of administrative structures or processes may not be seen as

necessary, so bureaucratic change will not be put center stage.

As for the bureaucratic reaction, compliant with Hirschman's (1970) considerations and the overall options of the PA to influence the policy process, three broad ways by which the public administration may react if exposed to a revolution can be identified: working (cooperation or, in Hirschman's diction, loyalty), shirking ("exit" according to Hirschman's diction, understood as "inner emigration"), or sabotage ("voice") (see also Brehm and Gates 1997).

Regarding the government-administration relationship, shirking or sabotage can be discussed as "coalitional drift" or "bureaucratic drift" (Gailmard 2009) and "coalitional drift" (Ainsworth and Harward 2009). The first indicates that bureaucrats as the decisive actors of policy implementation deviate from policy preferences of the legislative and the government, putting their own interests center state. Coalitional drift characterizes a situation when policy preferences of the legislative institution or the government change (e.g., after a revolution) so that their agenda does not fit anymore to the mandate and the priorities previously assigned to the public administration. Hence, both approaches see the public administration as the agent and the legislative or government as the principal. Thus, the relationship between government and bureaucracy in the context of reaction to revolutions can be conceptualized in the framework of the principal-agent approach.

Consequently, the nomenclature is somewhat misleading at this point. While working is what is to be expected from a neutral and independent bureaucracy, shirking or sabotage are usually portrayed as negative behaviors. Hence, from the revolutionists' viewpoint, administrative behavior in line with – formerly accepted – principles of "good governance" may be sabotage, if the revolutionists prefer cronyism and patronage systems. Nonetheless, in these scenarios, shirking and sabotage can be judged as normatively desirable by other groups within and outside the country because it may avoid a complete anti-democratic revolution. Much of what is described positively as "administrative resilience" in this context is covered by these terms that are connoted negatively. Thus, in this entry the expressions are used in a nonnormative way, just indicating for noncooperation with the revolutionists or the new revolutionary government.

Overall, the potential reactions as outlined – no matter which concrete form they may take – place bureaucrats at a strategic gatekeeping function if it comes to the success or failure of a revolution. While empirical evidence remains limited, the examples outlined below provide some support for the deliberations so far.

## The Bureaucracy in Revolutions: Empirical Evidence

### Iran

In pre-revolutionary Iran, the public administration was not only characterized by high levels of corruption but also strongly interconnected with and omnipresent in all spheres of the society, and also the "regime relied almost solely on the bureaucratic state—military, security, and civilian. The regime and the bureaucratic state were identified with each other [. . .]" (Farazmand 2009: 550). "The bureaucracy was the key instrument of system maintenance and regime enhancement, and no change could be made in the bureaucracy and administrative system without a significant alteration in the political system" (Farazmand 2009: 552).

The Iranian revolution of 1978–1979 was a general popular uprising with the participation of all levels of the citizenry (Farazmand 2009). It was one of the aims or expectations of the revolution that the bureaucratic would be reorganized in a way as to be accountable and responsive to the public, as, unless changed and controlled, the "old bureaucracy could pose a serious threat to the revolution, its gains and its people" (Farazmand 2009: 569).

The revolution and the regime following to the revolution, the Islamic Republic, have impacted the Iranian bureaucracy in many ways. Significant changes of structure and behavior of the bureaucracy were the consequence.

Overall, "debureaucratization, institutionalization, and rebureaucratization" (Farazmand 2009: 553) were the manifestations of this change.

This massive change can be explained not only by the status quo ante as delineated but also by the perception of the public: "During the revolution, there was a general populist idea that the bureaucracy of the old regime was an oppressive machine and must be destroyed or totally reformed" (Farazmand 2009: 553). Traditional bureaucratic values lost reputation in public notion; pathologies as corruption or red tape were no longer accepted or tolerated.

Initially, the process of debureaucratization of Iran was characterized by the following features:

- Bureaucratic elites were immediately replaced; dismissals and forced or untimely retirements took place.
- Revolutionary committees and employee councils bypassed existing bureaucracies and hierarchical authorities on all levels, and administrative action was guided by revolutionary decisions that were implemented promptly.
- Religious, political, and revolutionary criteria established standards for administrative and managerial actions, and a merit system based on loyalty to the revolution and the Islamic government was introduced to steer recruitment, selection, and maintenance of the public personnel (Farazmand 2009: 554).
- Structural change took place in the sense of debureaucratization by either taking over the traditional structures, operating it in a revolutionary manner, or bypassing them by creating new structures.

In later years, decades after the revolution, structural changes, as well as adjustments in behavior and attitudes, can be observed. Structural changes as gradual standardization and routinization took place. Furthermore, an "institutionalization and solidification of the religious representation as a special elite force of executive policy and political decision-makers at the top of each agency, ministry, organization, and foundation in the country" can be observed; new revolutionary elites acted as "strategic patronage appointees in the bureaucratic agencies, where they have been performing the job of system and regime maintenance, regime enhancement, and coordination with other related agencies" (Farazmand 2009: 554). In this context, also attempts related to the control of the administration emerged. Another sustainable trend in post-revolutionary Iran is the relative shrinking of the size of the bureaucracy, disempowering it overall, as the size and number of public enterprises have significantly been reduced by privatization (Farazmand 2009: 555).

Overall, it can be stated that the public administration in Iran reacted to the change with "working," while shirking and sabotage have been the exception than the rule. Beyond explanatory factors as the discontent of bureaucrats with the pre-revolutionary regime, and the consecutive support for any kind of alternative, the fact that many leading bureaucrats emigrated before or in the context of the revolution can be seen as relevant. Borrowing from Hirschman, this "real exit" can substitute for shirking or sabotage as mute forms of exit strategies while staying in the system. In all, this administrative reaction can be seen as one pivotal factor for the stability of postrevolutionary Iran until now.

### Middle East and North Africa

The so-called Arab Spring, a wave of revolutions in Tunisia, Egypt, Libya, Syria, Bahrain, and Yemen, starting 2011, was a revolution of the people, in particular the youth, spanning all social classes, including religious groups, against autocratic regimes. These and lesser revolts in Morocco and Jordan — as well as muted ones in the countries in the Arab Gulf — shared aims and themes, as justice, democracy, political, and social reforms (Aman 2017). After independence from former colonial powers, most countries in the Middle East and North Africa "followed a path of development through comprehensive central planning that incorporated policies, projects, and programs formulated by the state" (Jreisat 2009: 583). Hence, the ideologies of the ruling political parties in many countries led to an extension of the economic dominance of the state and

a system that "stimulated hierarchical authority structures and maintained ruler-centered forms of administration" (Jreisat 2009: 584). Overall, the pre-revolutionary governance systems were characterized by severe problems (Schomaker 2013). This includes, inter alia, the following (Jreisat 2009): a high level of centralization of the public authority, political micromanagement, and excessive centralization of decision-making that led to undercutting and crowding out of mechanisms of accountability, evaluation, and feedback. Cronyism and corruption were widespread; autocratic leadership in diverse forms and mistrust within the politico-administrative system as well as in the state-citizens nexus characterized the respective countries. Furthermore, gridlock of administrative reforms was a persisting problem. Furthermore, rules were applied in a formalistic and rigid way, and the overall administration is "input rather than output oriented" (Jreisat 2009: 591).

In none of the countries of the "Arab Spring," the bureaucracy was significantly affected by the revolution, but on the contrary, the personnel of former regimes clearly still plays a prominent role in the bureaucracy (Momani 2014). While some cases of downsizing and privatization could be observed, these trends hit only selected sectors, but not the overall bureaucracy. Altogether, these trends were in place before the "Arab Spring" and cannot fully be ascribed to the revolution itself. The same applies to other – mainly modest and mostly only intended, but not implemented – administrative reforms.

While particularly the religious parties that were involved the revolutions and constituted the postrevolutionary governments in Egypt and Tunisia started to implement some reforms, e.g., into the direction of social justice, but also infrastructure provision, they were unable to implement reforms and new policies because of the "deep state." The persistence of principles and structures of the old regime, in particular the perpetuation of the military-dominated system, together with the high level of interconnectedness of the military and the economy, let to shirking and sabotage in important sectors. Evidence from, e.g., Egypt, underpins this, when after a postrevolutionary period under the new, elected Islamist government, the "old system" in a counterrevolution took over power again. Closely after, "Egypt's fuel shortages were no more, its electricity supply went uninterrupted and traffic police suddenly went back to work" (Momani 2014: 10). This indicates for active sabotage of the bureaucracy to the disadvantage of the revolution.

Overall, the revolution in particular in Egypt but also other Arab countries did not sustainably effect the bureaucracy. Moreover, also the political systems of the countries exposed to the revolutions shifted back, as, with the exception of Tunisia, the rest of the states which reverted to regime types similar to those in power before are in the state of civil war (e.g., Syria), or ended up as "failed states" (e.g., Libya). Following our delineations above, the resilience of the bureaucracy, or the incapability of the political level to enforce change, may be seen as a decisive factor.

## Concluding Remarks

Overall, the convolute of literature, in particular empirical evidence, on the role of the bureaucracy in revolutions is scarce. The reasons are twofold: first, the research focus of the scientific disciplines active in this field lies mostly on the political or societal level when it comes to revolutions. Second, practical reasons may matter, as one of the main challenges is the access to data about administrative behavior in times of revolution. As much of academic knowledge about bureaucratic actions comes from interviews or surveys, revolutionary periods do not provide researchers with conditions to gather relevant information. If existing, much information relies on ex post evaluations or perceptions related to bureaucratic behavior and therewith implies a lack of cross-country comparability.

Nonetheless, some insights can be drawn from theory and empirical evidence worldwide. From a conceptional viewpoint, the public

administration – depending on the anthropology that is applied – can be modeled as both, the driver of revolutions and the recipient. In the latter case, cooperation with the new regime, shirking, or obstructive behavior in terms of sabotage can be the reaction patterns of the bureaucracy once exposed to revolutionary attempts for administrative change.

Based on these deliberations, the final question is in how far a revolution affects the power of the bureaucracy. If the necessity to reform the public administration, or resources to do so, are missing, "bureaucratic inertia" can be expected: revolution does not really matter for the bureaucracy, and its position and power remain unaffected, caused by either the unwillingness or the inability of the revolutionist government. Alternatively, a paradoxical "empowering of the bureaucracy" scenario may emerge if the new government does not have the capacity or willingness to "invest" in bureaucratic reforms to their favor. If undertaken, measures of the revolutionists as outlined above may finally result in a "sidelining of bureaucracy," which implies that the PA as the main representative of the "traditional elite" either through patronage or with the use of "alternative structures" for policy advice and implementation loses power (Peters and Pierre 2018).

## Synonyms

Pakistan; Public administration; Revolution; Theories

## Definitions

Revolution refers to a forceful overthrow of the government or any social order which is in favor of and often leads to a new and modern system.

## Introduction

Revolution has been the key factor in shaping the modern era. The term itself points out the fundamental transformation and changes having the generic worth and usage which illustrate the phenomena in between the industrial and sexual revolution. Being a historical procedure, it denotes a drive that is usually violent and overthrows and brings a complete transformation in the main institutions of the societies. Moreover, subsequent to French Revolution in the eighteenth century which ousted the empire by transforming and reforming the whole society, it became identical to the thorough overwhelming from the earlier (Neitzel 2018). This changed the mind-set of several nations that modernity is only possible by passing through such a violent and complete revolution.

Later in 1917, the Russian revolution was commanded by the Vladimir Lenin (Wade 2017), which got the inspiration and motivation initially by the philosophies and conceptions of Marxist Communism. Mark assumed that transformation was essential in order to push the societies from historical phase toward the next modern era stage. Thus his ideas and assumptions reinforced the perceptions and insights of the revolution being a universal procedure in the historical domain which is quite inevitable. This revolution in Russia brought by the revolutionaries of that time had been the role model across the world for political transformations as well as a noteworthy transformation in the social and economic perspectives of the societies. The example of the Soviet Union (Akiner 1983) was particularly the great inspiration for anti-colonial and patriotic rebels ranging from the "Sun Yat-sen of China" to the "Ho Chi Minh of Vietnam," who found the solutions to their countries' problems and dilemmas while experiencing the USSR solutions. All this was a great motivation and inspiration for most of the revolutions of the twentieth century.

The year 1979 witnesses the Iranian revolution which is also called the Islamic Revolution or the 1979 Revolution. It refers to the series of events involving the takeover of the last Iranian Monarch, Muhammad Reza Shah Pahlavi, thereby replacing his government and transforming it into the Islamic republic under the leadership of Grand Ayatollah Ruhollah Khomeini. This movement was against the US-favored monarchy and got the support from several revolutionary and Islamic organizations. The main purpose of this revolution refers to dynasty that the revolution conquered – the Pahlavi dynasty. It was mainly known for its autocracy nature, which focused on modernization and westernization, and its indifference and disrespect for the religious as well as democratic procedures and measures in the constitution of Iran.

The twentieth century has been the revolution era in most parts of Asia. The pressure developed by the Euro-American imperialism which initiated in the nineteenth century had been one of the very essential elements that had promoted very important transformations in several states of Asia (Clarke 2002). As the industrialization of the nineteenth century within England, France, Germany, and America prolonged, their universal scope and range increased their demand for a number of raw materials and products. The viewpoint about the western values being superior along with their

economic development followed by the innovations in technology in building ships, weapons, and communication channels gives rise to a potent mix which might be challenging for the Asian states in multiple ways.

Several revolutionaries of Asia didn't only want independent nations, but they also wanted internal revolution within their societies. Earlier in the twentieth century, it was believed that in order to become modern, the old ancient hierarchies and pyramids need to be eliminated and create new ones which fit the modern societies with equal social relationships. In China, this was meant to eliminate and condemn the ancient Confucian customs as well as hierarchies and pyramids so as to undertake the essential social, economic, and political transformations and reforms (Fitzgerald 2019). Unlike this, Mohandas Gandhi (Gandhi) chose different tactics and thereby rejected the civilization inspired by western culture and promoted a shift to traditional Indian customs (Weber 2003). In both cases, the internal change and transformation were believed to be an essential and fundamental element of revolution for the national independence.

All these diverse and versatile experiences and concepts regarding "revolution" highlight the prominence of political and social transformation to the modern recent Asian history. Recently, with the disassembling of radical establishments within the Soviet Union as well as elsewhere plus the shift of China toward the market economy, certain historians started to revise their considerations and concepts related to revolution and its possible consequences. Hence, in view of these reconsiderations, there seems no uncertainty in the significance of revolution, in both the perspectives, i.e., as an objective and historical process and in forming the modern Asia and the world as a whole.

## Theories of Revolution

There are three main theories of revolution.

1. Revolution as Collective Behavior

   This theory is presented by Neil Smelser's in 1962 and also known as "Neil Smelser's Theory of Collective Behavior." It shows a breakthrough in the history of sociology of revolution due to being the pioneer endeavor to elaborate and examine the theme in the perspective of Grand Theory style of Talcott Parsons. The primary aim of this theory is clear from its title, i.e., to build a theory which explains the collective behavior. The main idea of the theory explains a general conceptual framework comprised of social actions having four fundamental constituents including values, norms, demonstration of individual motivation, and situational facilities. Furthermore, it witnesses the trivial of the argument "a revolution is irrational if it's not led by 'strain'", which means that it (strain) is not an essential condition of revolution, the revolution may take place with or without it.

2. Revolution as Social System Pathology

   This theory is presented by Chalmers Johnson in his book *Revolutionary Change* in 1966. According to this theory, revolutions are always the result of violence, though the author is confused whether this concept is related to the definition of revolution or the empirical facts. This confusion is due to the fact that several revolutions have been noticed which didn't involve any blood flowing or violence. Additionally, Johnson calls for the attention to the social systems experiencing revolution and illustrates the intermeshing of analysis of revolution with that of the sustainable and effective societies. This theory also mentions the society and revolution to be analogous to each other to some extent but doesn't assure this argument, whereas it states the physiology and pathology to be distinct analytically.

3. Revolution as Collective Violence

   This theory is presented by Ted Robert Gurr's in his book *Why Men Rebel* (Gurr 1970). The title creates confusion and gives the idea that this theory might be a theory of rebellion, but it is not so. This theory is based on the political violence, not the rebellion. Its main idea is to investigate and develop the testable and general hypotheses related to three facets of political violence which include its sources, magnitudes, and the forms. All these three aspects collectively give the main idea of this theory.

## Forms of Revolution

The process of revolution has a long history of bringing fundamental transformations in such a form that fits the society and its political system. Several diverse social as well as political changes might be referred to as "revolution" as it has no specific way of categorization. Yet, it's necessary to know about the forms of revolution which have been occurring since several decades. Revolution occurs in three massive forms which include (1) agricultural form, (2) industrial form, and (3) information form. It's a change that takes place swiftly and immensely, resulting a society to undergo a basic revolution. These changes may be political, economic, as well as social in nature, but the ultimate goal of all of these is to bring fundamental transformation in a society. Any form of revolution is often initiated by the process of development, which in turn is a sort of strategic effort in order to bring progressive changes within the society. The first form of revolution, i.e., agricultural form, relates to many decades ago when the rovers took the initiative to get out of shifting form one place to another. To cope with this, they started cultivating and domesticating plants and animals. In addition, the latest technologies, for instance, from the simple dig to complex systems of irrigation. The emergence of these technologies caused the surplus production of food and other crops leading to the agricultural revolution which in turn formed small cities and villages. People living there started making furniture including beds, chairs, and tables which led them to change their living styles. Hence, this form of revolution transformed the society from simple to the complex one having a stable style of living.

The second form is the industrial revolution. It brought a huge transformation in the way that was used to make things, and people started using machines instead of hands for makings in the middle of the 1700s. Industrial revolution actually replaced man power with the machines, and the production shifted to the factories and industries instead of shops and stores. The third form of revolution is the information revolution which completely reshaped the societies and nations. It began with the time when the computer chips were invented which introduced laptops and mobile phones and other emerging technologies. It facilitated transportation as well in the form of navigation system being utilized in cars. Several jobs based on service such as the computer engineering are facilitated by this technology. It helps in communication among people and promotes education and transportation. Thus, it transforms the arrangements of living, for instance, the way families used to spent time with each other and type of work being done along with some additional aspects of life. The fundamental values for this form of revolution include globalization, disseminating ideas, as well as reshaping societies and economies.

## Public Administration in Pakistan

Being a historical process, revolution has touched almost each and every element that exists in this universe. Out of which, public administration is one of them which has a fine record of revolutions around the globe as well as in Pakistan (Sabharwal and Berman 2013). The shift from epoch of the government to that of governance has caused public administration to lead the inspirational and influential transformations in the operationalization of developed as well as developing nations of the twenty-first century. The discipline of public administration being related to academic is passing through variations because of the effects of globalization, the varying dogmas of the government, and its subsequent transformations in the public memos as well as discourses and sermons all over the world. As after the Second World War, the governments had been witnessing an exceptional rise in the societies in developed as well as developing nations by showing their extraordinary role and performance, as the development of societies was on the part of states. Since the 1980s, contrary swing has been observed around the globe due to the emergence of globalization for exemplary change in prominence toward market-oriented, growth model led by the private firms, a basic viewpoint to narrow the administrative government by contracting its size as well as regulating the expenditure of public.

In the twentieth century, various fluctuations in public administration have been observed due to the variations in the nature, functions, and ideologies of governments across the world. Practice of

the customary type of public administration faced continual aggression from the illiberal economists who have been the choice of public for leading the rational arguments to minimize the size and expenditure of public sectors. History witnesses the public administration for altering the socioeconomic as well as political affairs of the contemporary eras and their subsequent influence on functioning and performance of the government. Currently, it is facing inconsistent political and operational pressures that are diverting it toward the colonial agenda (the one from South) as well as the reductionist one (from the north-centric). The task of public administration in each and every state lies in reestablishing its raison "raison d'être" on the basis of specific legal, lawful, constitutional, monetary, as well as political prerequisites periodically. Hence, the public administration in Pakistan has also been witnessing several fluctuations which vary from the type of the ruling government (Zia and Khan 2013). Currently, the structure of public administration of Pakistan has the following hierarchy which can be better understood by looking at Fig. 1. There are three main bodies (i.e., executive, legislative, and judicature branches) which form the structure of the public administration of Pakistan and have further levels of authorities which run the system (National democratic foundation Pakistan-2019).

### The Executive Government

This is the first and highest level of public administration of Pakistan which deals with the execution of policies and laws within the state. The head of the executive level is the prime minister of Pakistan.

### Prime Minister of Pakistan

The prime minister is the overall head of government and chief executive of the country who is responsible to lead the executive office of the state and watch economic development and growth. The prime minister precedes the body concerning the common interests and cabinet; besides he/she is entrusted with the regulatory powers related to the nuclear resources. In addition, he/she controls the overall matters regarding internal as well as foreign policy. National Assembly of the country appoints the prime minister through casting of votes, who later gets assistance from the Federal Cabinet, body of ministers consisting of members which are selected by the president of the state with the consent of prime minister. The Federal Cabinet consists of ministers including sate ministers and advisers.

**Revolution and Public Administration in Pakistan, Fig. 1** Public Administration of Pakistan. (Source: National democratic foundation Pakistan)

### The Parliament

The bilateral federal legislature comprises of Senate (also known as upper house) and the National Assembly which is also known as the lower house. Referring the Constitution's Article No. 50, National Assembly, Senate along with the President of Pakistan join together and form a body which we call the "Majlis-i-Shoora," also known as the Council of Advisors.

### The President of Pakistan

President is the official State Head and nominal head who is a civilian chief commander of the armed forces of Pakistan as per written in the constitution of state and the whole nation's leader. The president gets all the information from the prime minister regarding overall matters of policies (both internal and foreign) and all the proposals pertaining to legislation. According to the constitution, the president is empowered to confer pardon, amnesties, and military control. Thus, he makes all the essential higher command appointments of the military with the consent and approval of the prime minister. Additionally, the constitution forbids him from executing the power to run the government.

### The Senate

It is a permanent legislative body having alike representation within all the provinces of Pakistan, due to the reason that it is selected by the members of provincial assemblies from all the provinces. Besides, there are also members from Capital Territory (Islamabad) and FATA (Federally Administered Tribal Areas). The constitution allows the chairman of Senate to act as President of Pakistan in his absence, until a new one is elected. The Senate along with National Assembly are only authorized to pass the legislation bills, but they can't pass the finance bills. Whereas, in case of other bills, the president might avoid until the joint sitting of legislatives dominate the president by the presence and voting of the majority of legislatives from both the houses. Moreover, the president can only dissolve the National Assembly, but can't do the same with Senate.

### National Assembly of Pakistan

National Assembly (NA) members are selected by the common adult ballot (18 years of age). Based on the population, seats of national assembly are distributed to all the four provinces, FATA and Capital Territory. All the members are required to serve for 5 years which is the due term of the parliament, unless the assembly dissolves or any member resigns or dies earlier. Despite the majority of members being Muslims, 5% of the seats are still allocated to minorities which include Christians, Hindus, and Sikhs. Besides, more than 50 seats are reserved for women which are nominated by heads of the parties in each province.

### The Jurisdiction

The Judiciary is comprised of the Supreme Court (SC), high courts of all the provinces, district and session courts, and civil and magistrate courts which exercise civil as well as criminal discretion. Some of the federal and provincial courts as well as committees like services, income and excise tax, and banking court along with the tribunals of board of revenues are also established in all the provinces separately.

### Supreme Court

It has the real, appellate, and consultative jurisdiction. Its chief justice is selected by the president of Pakistan, who helps the president to select all other judges later. All the judges including the chief justice serve up to the age of 60.

### Federal Shariat Court (FSC) of Pakistan

It's the only court having the authority to inspect and scrutinize if the laws being exercised within the state are compliable with the laws of Shari'a or not. FSC is comprised of eight Muslim judges selected by the mutual consent of the president and the chief justice of FSC. Out of these eight judges, at least three must be the Ulema having sound knowledge of Islamic rules and law. Initially, all these judges have 3 years of time to serve which may be extended later by the president. Their duty is to find out any laws of the state which don't comply with the Islamic law and

inform the government for timely amendment in those laws to avoid violation. FSC performs revisional jurisdictions in the criminal courts to resolve the cases of Hudood. Its decisions are obligatory for the high courts and subordinate judiciary. In addition, it assigns the personnel and forms the specific rules and principles of the procedure.

### Provincial and High Courts

At present, provincial high courts are functional in all the four provinces of Pakistan, and after the sanctioning of the 18th amendment in constitution in April 2010, the high court is also formed in the Capital Territory of Pakistan with the name of capital, i.e., Islamabad High Court. The appointment of all the judges is proposed by the commission of the parliament. Additionally, some special courts also exist which deal with particular type of cases, like drug, commercial, labor and traffic courts, the appellate panels for insurance and income tax, as well as the offences happening in the banks. Certain special courts are also there to deal with the terrorist cases. The appeals and pleas of the special courts are directed toward the high courts excluding the courts of labor and traffic which are specific for the cases of labor and traffic and have their own procedures, while the appeals and pleas from the tribunals are directed toward the Supreme Court.

### Ombudsman/Mohtasib

An additional aspect of the judiciary comprises of the Mohtasib, also known as the Ombudsman, which is also approved in the constitution of Pakistan. The offices of the Ombudsman were formed in several Muslim countries and Pakistan which were responsible to make sure that no wrong doings are being done to the common people of the state and ensure the transparency. They are selected by the president of Pakistan for the fix term of 4 years having no chance of extension or renewal. The purpose of the Mohtasib is to regulate a system which enforces accountability in administration by inspecting and identifying any discrimination done to any citizen by the federal agency or officer of the federal government. The Mohtasib is authorized to compensate the victims. The aim of this institution is to fill the gap among the administrators and the citizens, refine and develop the procedures of administration, as well as restrict the exploitation of discretionary authorities and powers.

## Conclusion

Revolution has a long history of bringing transformation in the societies across the globe. It has brought a lot of favorable changes in Pakistan and its public administration and all of its three main forms which are agricultural, industrial, and information form. The hierarchy of public administration is well-defined in this chapter which ranges from the executive level up to the judiciary level. All these are working together to bring positive changes in Pakistan and facilitate the citizens to their best.

## Definition

| | |
|---|---|
| Revolution (originates from Latin *revolvere* = roll back) | In political science, revolution is a phase of the historical evolution of nations that generates a rapid and structural change in society. |
| Evolution (originates from Latin *evolvere* = to roll) | In science, evolution is a progressive growth of a system that generates a transition from simple to complex system in nature and society. |

## Revolutions

Revolution is one of the most important phases in the historical evolution of nations. Revolution can be defined as: "change, effected by the use of violence, in government, and/or regime, and/or society. By society is meant the consciousness and the mechanics of communal solidarity, which may be tribal, peasant, kinship, national, and so on; by regime is meant the constitutional structure-democracy, oligarchy, monarchy; and by government is meant specific political and administrative institutions" (Stone 1966, p. 159). This definition allows to distinguish between the seizure of power that leads to a major restructuring of government or society and the replacement of the former elite by a new one, and the coup d'état involving no more than a change of ruling personnel by violence or threat of violence. In the 1960s, social scientists at Princeton University have changed the word "revolution" with the concept of "internal war": any attempt to alter state policy, rulers, or institutions by the use of violence in society, where violent competition is not the norm and where well-defined institutional patterns exist. In philosophy, Georg Wilhelm Friedrich Hegel suggests that revolution is equated with irresistible change represented by a manifestation of the world spirit in an unceasing quest for its own fulfillment. In the field of philosophy, Karl Marx also argues that revolution is a struggle between bourgeoisie and proletariat. Hannah Arendt interprets the revolutionary experience as a type of restoration, whereby insurgents attempt to restore liberties and privileges, which were lost because of government's temporary lapse into despotism. Instead, Alexis de Tocqueville has defined revolution as an overthrow of the legally constituted elite, which initiated a period of intense social, political, and economic change.

The main characteristics of revolution are, according to Deutsch (1964, pp. 102–104):

(a) Degree of mass participation
(b) Duration
(c) Number of persons killed both during and after the revolution (a measure of intensity)
(d) Intentions of the insurgents

In general, a prime factor of revolution is the emergence of an obsessive revolutionary mentality. By following a behaviorist approach, the causes of alienation of revolutionaries and of weaknesses of incumbent elite are economic factors. In this context, Karl Marx states that popular revolution is due to increasing misery, whereas Alexis de Tocqueville claims that revolution is due to increasing prosperity. Olson (1963) argues that revolutions are the product of rapid economic growth, which creates both *nouveaux riches* and *nouveaux pauvres.* Davies (1962) suggests that the fundamental impetus of a revolutionary situation is generated by a rapid and long-run economic growth associated with a rising of the standard of living, followed by a short-term phase of economic stagnation (cf., Coccia 2014a,

2015a, 2016, 2017a, 2017b, 2018c; Coccia and Bellitto 2018). In fact, revolution creates new expectations by economic improvement, but subsequent economic recessions can increase the gap between expectations and real condition of population (Davies 1962; Coccia 2010a).

Revolution has a variety of typologies in different societies. Brinton (1938, pp. 3–4) suggests a differentiation between coup d'état that is a simple replacement of one elite by another one and major revolution that generates social, political, and economic change. Huntington (1962, pp. 23–24) presents a further refinement in the classification of revolution using four categories: the internal war, the revolutionary coup, the reform coup, and the palace revolution.

Finally, Chalmers (1964) categorizes revolution in six typologies as follows:

1. The jacquerie is a spontaneous mass peasant rising.
2. The millenarian rebellion is similar to the first type but with the added feature of a utopian dream, inspired by a living messiah, such as the revolution of Florence in Italy led by Savonarola, a religious and political reformer, in 1494.
3. The anarchistic rebellion is the reaction to progressive change, involving an idealization of the old order, such as the Vendée Rebellion (1793–1796), counterrevolutionary insurrections in the west of France during the French Revolution.
4. The Jacobin communist revolution is: "a sweeping fundamental change in political organization, social structure, economic property control and the predominant myth of a social order, thus indicating a major break in the continuity of development" (Sigmund Neumann as quoted in Chalmers 1964). The goal here is the creation of a more efficient order in society on the ruins of the old structure of privilege, nepotism, and corruption.
5. The conspiratorial coup d'état is the planned work of a tiny elite fired by an oligarchic ideology. This is a revolutionary type only if it anticipates mass movement and generates social change, such as the Castro revolution in Cuba from 1953 to 1959; it is distinguished from palace revolt, assassination, dynastic succession-conflict, and other forms of political violence, which are all under the category of "internal war."
6. The militarized mass insurrection is a planned mass revolutionary war guided by dedicated elite. This guerrilla warfare is determined by political attitudes and rebels are dependent on popular support. This type of struggle is the insurrection in Vietnam, 1965–1973; Algerian War, 1954–1962; Afghan resistance, 1979–1989; etc.

Finally, Coccia (2018a) argues that terrorism is a distinct form of political violence with some characteristics similar to revolution. Terrorism, like revolution, emerges in the presence of social and political issues and of a group organized of people having a purpose related to these issues (cf., Coccia 2017c). Coccia (2018a) argues that terrorism thrives in specific regions with high growth rates of population, which may generate income inequality and relative deprivation of people in society (cf., Coccia 2017c). In short, terrorism has many analogies with revolution (e.g., economic, social, political, and demographic determinants), and it can generate structural change in problematic societies, such that terrorism might be considered an additional and specific form of revolution (cf., Coccia 2018a).

Overall, then, revolutions are due to instability of manifold economic, social, demographic, ethnic, anthropological, and perhaps religious factors in society. Revolutions are mainly linked to the question of what human beings truly need and how they seek to satisfy needs, solve social issues, and adapt to turbulent contexts and environmental threats in society.

## Evolutions

Evolution is a progressive growth of systems (Coccia 2018b, 2019). The concept of "evolution" was first applied to natural phenomena by the German biologist Albrecht von Haller in 1744. Darwin (1859) preferred phrases like "descent with modification" and only once wrote

"evolved." In this research field, Herbert Spencer (1902) did much more than Darwin (1859) to popularize the term "evolution" that can be associated with different types of phenomena, including all feasible manifestations of development and change in biological and social systems. In general, under some conditions, evolution must involve Darwin's principles of variation, inheritance, and selection (Coccia 2018b, 2019). Bagehot (1872) argued that the principle of selection could explain survival and evolution not only of individuals but also of groups, customs, nations, business firms, and social institutions. In short, the principle of selection provides the means for explaining adaptedness, survival, and evolution of systems in nature and society. In the evolution of complex systems, some scholars point out that self-organization or spontaneous order is an alternative concept to Darwinian selection (Von Foerster 1960). Moreover, other scientists consider social evolution as a Lamarckism process rather than Darwinian one. In fact, the Lamarckian inheritance of acquired characters may occur in social evolution where characteristics acquired or learned by individuals that are more adapted to their environment, they can generate changes. In general, social evolution can be due to successful rules, habits, or behavior spread by imitation and learning in different environments.

The studies of evolution also show that individuals and human society can give up resources to benefit their neighbors, to the extent that this helping lowers the entity's reproductive fitness. These altruistic traits of subjects pose a difficulty for Darwin's theory of natural selection, which emphasizes the spread of individually advantageous traits (Darwin 1859). The altruism abounds in natural and social systems and generates cooperation between potentially competing individuals and co-evolution. Szathmáry (2011) argues that the benefits of altruism and cooperation can drive the social evolution because they must pay off, even if they are immediately costly to cooperators.

The evolution in society is also associated with the concept of human progress. Spencer (1902, p. 253) suggests that social evolution is: "the full happiness of each, and therefore to the greatest happiness of all." In particular, the idea of evolution in society is based on: "progressive satisfaction of human wants in all their ramifications and complexities. It is this inner kernel of human satisfactions which gives character to the whole account of social evolution; which is interpreted, not in terms of mechanism, . . . but of purpose" (cf., Woods 1907, p. 816). In short, the fundamental elements of social evolution are health, wealth, sociability, knowledge, beauty, etc., of people in society (Woods 1907). These elements support the acquisition by humanity of better and more complex forms of life. Social evolution is also driven by new technologies that yield greater and cheaper satisfaction of human wants and support problem-solving activity (cf., Coccia 2010, 2014, 2015, 2015b, 2016, 2016a). Moreover, social evolution is achieved in appropriate structures with strong democracy, good economic governance, widespread higher education system, and higher innovative outputs (Coccia 2010, 2018a). In fact, Woods (1907, p. 817) points out that: "Progress in an individual or in a community is thus a function of all the various qualities and aspects of life which are there realized. Not physical well-being alone, nor the abundance of wealth, nor even the moral advance which has been attained, may serve as the measure of progress; all of the interests are required because all are phases of normal human life." Hence, determinants of socioeconomic evolution and, as a consequence, of human progress seem to be human wants and human control of nature through science advances and new technology (cf., Coccia 2010, 2018a; Woods 1907).

To sum up, evolution can generate two types of change within systems:

*Growth* is a proportionate change of elements or subsystems within a system over time. This process generates symmetrical progressive changes between parts of a system (e.g., size and shape of the wings of butterflies, Gross Domestic Product growth of countries, etc.).

*Development* is a disproportionate change of subsystems or elements as a consequence of change in the overall system. This process generates inequalities and asymmetric changes between the elements or parts of a system (e.g., asymmetry of leg size in the sand fiddler crab; economic

**Revolutions and Evolutions, Fig. 1** General characteristics and goals of revolutions and evolutions

dynamics of capitalism that generates a wealth of rich countries higher than of poor ones).

## Conclusion

Krader (1976, pp. 109–110) argues that: "The concept of advancing society through the combined agencies of evolution and revolution was at one time related in a single overarching theory. The opposition of evolution and revolution, on the contrary, stands to us not as a dialectical relation whose contradictions are to be resolved, but as an unresolved tension. . ..The theory underlying social evolution is doubly linked to biology."

Overall, then, evolution and revolution are a cyclical phase in human society and nature affected by manifold factors that can change over time and space (Fig. 1). A comprehensive analysis of these phenomena in nature and society, associated with economic, social, psychological, anthropological, and biological factors is a non-trivial exercise. To conclude, revolutions and evolutions are a result of human activity and nature in order to take advantage of important opportunities, to survive, to cope with and/or adapt to environmental threats and/or changing contexts.

# Reward Management

Geoffrey White
Faculty of Business, Old Royal Naval College, University of Greenwich, London, UK

## Synonyms

Compensation; Pay; Remuneration

## Definition

The term *Reward Management* refers to the area of human resource management concerned with the ways in which employees are remunerated and motivated to improve performance or productivity. The terms *compensation*, *remuneration*, and *reward* tend to be used interchangeably in the human resource management literature, and in the USA the term *compensation* tends to be used more than reward. Reward Management in the public sector has several distinguishing characteristics.

## Introduction

The ways in which public servants are paid has traditionally been an important issue for public policy and often a contested part of the employment relationship between Government and its employees. In the wider economy, there have been major changes in the remuneration of employees over the last three or so decades in the advanced economies of the world, with new terminology to signify these changes. Viewing remuneration as a key strategic tool for management has been a key aspect of this new approach. These changes in the private sector have led in turn to increasing pressures on public sector organizations to follow suit although there remain some important differences between private and public sector reward practices.

What was once called "pay and conditions" has increasingly become known *as Reward Management* in Europe and the *New Pay* in the USA. The definition of reward has been widened over time to embrace other elements of the work relationship, including intrinsic factors such as nonfinancial rewards, work satisfaction, and employee well-being and engagement. The origins of the term Reward Management in the UK can be found in the seminal book of this title by Armstrong and Murlis (1988) which set out a new strategic approach to managing remuneration. The distinguishing characteristic of the new term *Reward Management* is that it envisages the active management of remuneration policies and practices, rather than the traditional "pay administration" that had existed previously. In the USA a similar paradigm developed, known as the *New Pay* (Lawler 1990; Schuster and Zingheim 1992). More recently the term Reward Management has tended to be conflated with *strategic reward* and *total reward* or *total compensation*.

## Reward as Strategic Lever

The concept of remuneration being dependent on business or organizational strategy reflects a shift away from a world where the management of remuneration was primarily a case of pay "administration" and an outcome of collectively bargained agreements, or, in the case of large corporations in the USA, strong internal labor markets where job evaluation and external pay referencing fixed the pay structures for most staff. Heery (1996) identified three important aspects about the "New Pay." First, the ratio of variable to fixed remuneration is shifted in favor of the former, reducing the amount of guaranteed pay to the employee. Indirect remuneration (i.e., benefits) is also reduced in favor of more direct forms of reward. Second, the scope of variable pay is expanded to reflect a number of different measures of performance. Third, the New Pay emphasizes the importance of the individual employee's performance, rather than the level of job done. Hence the New Pay writers view job evaluation, collective agreements, external pay referencing, and narrow-banded grading structures as inimical to more strategic forms of reward. The growing attraction of remuneration flexibility has been attributed to the prevailing emphasis on supply-side economics rather than the demand-side economics that prevailed in the immediate post-war period (Standing 1997). The supply-side economists' argument is that wage rigidity is an obstacle to "market clearing" and, more specifically, is responsible for the high and persistent unemployment that has affected the industrialized nations, which must increasingly compete with developing economies with much lower wage costs.

| Pay and Grading Structure | Pay progression System | Variable Pay | Benefits |
|---|---|---|---|

**Reward Management, Fig. 1** Components of a reward system

The concepts of Reward Management and New Pay have not gone unchallenged in both the practitioner and academic literatures. Pfeffer (1998) suggested that an overreliance on pay to secure the motivation of employees may be at the cost of more powerful motivators such as meaningful work, job satisfaction, and a trusting and friendly employment environment. Lewis (2001) argued that, while the concept of strategic reward seems highly rational, it makes significant assumptions about both business strategy and human behavior. Most recently, research by Trevor (2011) in the private sector found that a strategic approach to reward is often difficult to operate in practice and that most reward policies at organizational level are based more on the principle of risk reduction than strategic intent.

## The Composition of Reward

The main components of any *reward system* are (1) a *pay structure* (the hierarchy of pay differentials within the organization and the method for allocating value to individual jobs or roles), (2) a *pay progression* system (whereby employees' remuneration is regularly increased through various criteria such as seniority, performance, competence, skills, or market value), (3) forms of additional *variable pay* (such as incentives, bonuses, location payments, and premiums for working unsocial hours), and (4) a *benefits package* (such as holidays, sick pay, family-friendly policies, and pensions). In recent years there has been an increasing attention to the whole employment experience as a reward, including the intrinsic benefits of the employment situation as well as the extrinsic elements set out in the employment contract. This new approach has been termed *total reward*. As will be argued later, the importance of intrinsic rewards has always been an important part of the public sector reward offer. In considering the distinguishing characteristics of public sector reward systems, we later consider each of these components in turn (Fig. 1).

It is worth commenting that in the past the reward systems of both private and public employers were more similar, with their design predicated upon the need to recruit and retain staff in competitive labor markets and to motivate them to high performance or improved productivity. Until the 1980s in many countries, the emphasis was on reward policies such as seniority pay to reward loyalty, job evaluation to ensure equitable valuing of different jobs and roles, and generous benefits packages that could attract and retain staff long term (such as good pensions), and these applied in all large organizations, whether public or private. For example, in the UK the banks were once seen as paternalistic employers that valued loyalty and rewarded this through job evaluated, seniority-based career structures with guaranteed pay progression and good benefits with little use of incentives or bonuses. Pay determination in the majority of organizations was also often achieved through collective bargaining between employers and trade unions. Nonetheless there have always been noticeable differences between the remuneration policies for public servants and those of private employees, in many countries manifested through separate legal requirements for the employment of public and private sector employees. Most importantly, in the past the Governments saw their role as setting an example of good employment practices to the private sector so that the public sector became the employer of choice for many employees.

## The Distinguishing Features of Public Sector Reward

Several features have been identified that distinguish public sector employment, and these features have influenced the design of reward

systems in the public sector. First, public accountability has affected the design of reward systems in ways that do not generally apply in the private sector. This is because most public servants are under the direct control of the Government, because their salaries are paid for through taxation and because their jobs exist primarily for the benefit of citizens. Because public servants are paid out of Government expenditure, they are often the first to see the impact of economic recession as public expenditure reductions are implemented. While public sector organizations' individual objectives are often complex and sometimes in conflict, most public sector employment is managed through the political process (Pollitt 1993). The public sector can be characterized as having institutional goals that are more numerous, intangible, and conflicting than those in the private sector. These demands transcend commercial and economic considerations and are shaped by "social utility that benefits all and excludes none" (Beszter 2016, p. 356).

Second, public sector organizations are often large scale in the scope of their service delivery and hence administratively complex. Public services also tend to be labor rather than capital intensive so that when we speak of investment in public services, we are primarily referring to labor costs. Public service organizations are also more constrained than private firms in how they can achieve productivity or efficiency savings because reducing staffing levels may reduce the quantity or quality of the services provided to the public. In some cases there may be statutory requirements about staffing levels or service availability. The scale and nature of public service delivery therefore leads to rather bureaucratic approaches to reward design.

Third, many public sector jobs are only found in the public services (e.g., teachers, doctors, nurses, social workers, police officers, and fire fighters) so that their employers hold a virtual monopoly over their employment. Deciding the price of these public sector-specific jobs and roles is therefore more difficult than simply relying on market comparisons as the private sector does. Pay comparability has therefore been an important feature of public sector pay systems in the past and continues to be so for many public servants.

Fourth, in many countries the public services remain highly unionized, compared to the private sector, although their pay determination arrangements may be subject to legal constraints (e.g., "no strike" requirements or independent fixing of their pay and conditions). In some cases, however, (e.g., in the USA) there may be prohibitions on union membership for public servants. The high level of union membership in the public services in many countries has tended to reinforce the prevalence of centralized, bureaucratic approaches to reward design, whether determined through collective bargaining or statutory means.

Fifth, and finally, the most important characteristic of public sector employment has been the issue of *public sector ethos* where it is assumed that public employees will be more motivated by the concept of public service than income-maximizing behavior. The case for a public sector ethos was set out by Plant (1993) as consisting of four elements – motivation, trust, impartiality, and judgment. These public sector values have strongly influenced the design of public service reward policies with the emphasis upon career development, equity of treatment, and recognition of service and loyalty rather than incentives for high performance.

In terms of reward system practice, those in the public sector have traditionally been bureaucratic in nature with a strong emphasis on uniformity in grading and pay progression systems with clear grade levels and guaranteed, service-related incremental pay increases. Given the career nature of many public sector professional roles, this uniform approach is not surprising. In the past, forms of additional, variable, pay have been very limited (e.g., limited to items such as unsocial hours payments and location allowances), except where there was clear competition with the private sector as in the case of skilled craft jobs (White 2011). There has been little linkage of pay to performance or merit although, as we shall discuss, this is changing. Benefits provision has also tended to emphasize loyalty and careers, especially in the provision of generous pension entitlement. Indeed in many countries, the public sector was the first employer to provide

pensions to employees (e.g., to civil servants and armed forces personnel).

Pay determination methods for public sector employees vary considerably between countries. According to the OECD (1994), pay systems can be viewed along two axes – one in which there is some form of joint regulation of remuneration and one in which pay is determined through legislation or Government decisions. On the first axis the form of pay determination ranges from collective bargaining between employers and trade unions (e.g., parts of the UK public sector and the Netherlands) to some form of independent pay review (e.g., the UK Pay Review Bodies, civil servants in Japan). On the second axis, it ranges from complete Government discretion (e.g., *Beamte* civil servants in Germany) to systems of "fixed rule employer regulation," where rules have been established for the automatic linkage of pay increases to one or more criteria – for example, wage indexation (e.g., US Federal Civil Service). Of course, in reality many countries fall between these ideal models and operate hybrid systems (e.g., Germany).

## The Influence of New Public Management

From the 1980s the emergence of the *new public management* (NPM) paradigm (Hood 1991; Ridley 1996) was to have an important impact upon public sector employee relations and reward systems in many developed countries. New public management was seen as an alternative approach to public administration and involved a number of elements (Bach et al. 1999). These included a stronger management function, with devolution of more control to local managers who were made accountable for the performance, both financial and service delivery, of the units which they managed. This was accompanied by a breaking up of public service organizations and a decentralization to separate agencies, departments, and units. A third element of NPM was the shift to a more market-oriented approach which attempted to shift from "management by hierarchy" to "management by contract." This was facilitated through new requirements for competitive tendering of services and internal markets.

Alongside NPM went a view that public sector reward systems were unsuited to the new managerial perspective and that such systems should mimic those of the private sector. This led to an increased emphasis upon more flexible pay systems with more attention being paid to local labor markets and affordability, instead of national pay structures, comparability processes to ensure fair pay for public servants, and seniority-based progression. In particular there was an attempt in many countries to replace guaranteed service-based progression with performance-related pay systems. This was particularly the case for civil servants in the USA, the UK, Australia, and Sweden (Bender and Elliott 2003). In terms of pay determination levels, national bargaining for public servants was quite different to that in the private sector, where employers had conceded authority to a central employers' body to bargain nationally. In the public sector the state has always had responsibility for pay determination, and the delegation of pay bargaining to decentralized units, where it has happened, has been imposed rather than freely chosen. At the same time, Governments remain wary of ceding too much power to local managers to determine pay levels because of the risks to public expenditure overspends.

Research by the OECD in 1994 detected some major changes in public sector pay in OECD countries, but these changes were not consistent (OECD 1994). Two main approaches were identified by the OECD – (1) maintenance of relatively centralized systems and the development of flexibility in ways other than remuneration flexibility (e.g., France, Spain, and Germany) and (2) organizational restructuring and decentralization of pay determination to lower levels, allowing more management decision-making at sectoral or local level (e.g., the UK, Sweden, and Finland). White (2000), in a study of reward changes in Europe and the USA, identified three main ways in which reforms were being undertaken – (1) changes in the method and

locus of pay determination, (2) changes in grading and job classification, and (3) changes in pay progression systems.

## The Age of Austerity

More recently, since the great economic recession of 2008, austerity measures imposed by Governments in the USA and Europe have seen increased pressure on public services and their employees. This has often entailed enforced pay freezes to reduce public expenditure, job losses for public servants, and renewed efforts to reform public sector reward practices. The OECD (2012) warns that, while curbing public sector wages might help improve fiscal positions in the short term, in the longer term, it runs the risk that they might rebound at a later stage or that public sector pay might lose competitiveness relative to the private sector. Performance-related pay is not seen by the OECD as a universal panacea, but it argues that it can be a potentially useful complement to other elements of performance-oriented management practice, citing the examples of Denmark, Finland, Korea, and the UK. Equality issues, and especially reducing the gender pay gap, are also seen as priorities, which will entail not simply ensuring equality-proofed grading and progression structures but also practices such as gender pay audits and developing career opportunities for women.

The OECD argues that the reform of public sector reward systems must be through a process of open dialogue between employers and employees, although there is no mention of collective bargaining having a role. This dialogue should contribute to promoting internal equity throughout the public sector, reflect the values of public organizations, and align compensation with Government's core strategic objectives. The OECD also argues that the processes for rewarding public employees must be fair and transparent in order to attract and retain a talented public workforce.

Research on the impact of austerity on public sector employee relations has found that pay changes have been implemented in different ways. Pay freezes or cuts for public servants were common across a majority of European countries, and, in most cases, pay freezes or pay cuts have been imposed by legislation rather than negotiation with trade unions. Some countries also targeted other forms of remuneration (Eurofound 2015). Greece, Hungary, and Portugal all eliminated bonuses, such as the "13th month" payments, while Bulgaria, Ireland, and Slovenia all reduced paid leave (such as for sickness). Performance-related pay was introduced in Bulgaria in 2011 and in Portugal in 2007–2008, and a 2010 Italian decree partially exempted performance-related pay from a broader freeze in wages. Estonia, however, reduced performance-related pay during its recession. Similarly, Bulgaria, the Czech Republic, and Portugal moved to loosen or eliminate the link between pay and length of service.

## Conclusion

Despite significant changes in both the forms of pay determination and the components of reward for public servants over the last three decades, the management of remuneration in the public sector retains some distinguishing characteristics, not least the ultimate power of Government to intervene in the pay determination process. While the 1990s saw the impact of NPM on public sector reward systems, with the introduction of more flexible grading systems and increased use of performance-related pay, since 2008 the major intent has been to reduce public expenditure and hence to reduce public sector pay costs. This has seen pay freezes and pay cuts for public servants and reductions in benefits such as pensions entitlement.

# Rewards for High Public Office

Masashi Yui
School of Government, Victoria University of Wellington, Wellington, New Zealand

## Synonyms

Compensation; Public sector executive pay; Remuneration

## Definition

Rewards for high public office are pay and perquisites offered to political and administrative executives. The way of rewarding them differs depending on a combination of cultural, economic, and political settings, which can reveal a great deal about how political and administrative systems work and what norms and values are in play in those systems.

## Introduction

Rewards for high public office – pay and other benefits offered to top-level officials in the public sector, such as prime ministers or presidents, cabinet ministers, members of parliament, top-level civil servants, and senior judges – are important in many ways. At individual levels, rewards are incentives affecting individuals' decisions to take up positions with the highest responsibilities in the state. At societal and government levels, rewards at the top, which come down to the issues over the relationship between the rulers and the ruled, give us greater insights into how political systems function and what values and norms are behind remuneration approaches taken by those political systems. Also, rewards for high public officials are characterized by a great deal of divergence around how and how much top state officials are rewarded. Variations in top rewards across countries thus seem to lend limited support to the convergence view. In light of this, analyzing

and understanding the variations in top-level rewards is important to better understand differing cultural, economic, and political characteristics of countries and jurisdictions.

In the area of study on rewards at the top of government administrative and political systems, the reward levels and their changes over time in European countries and the USA were examined (Hood and Peters 1994), after which analysis was carried out also in Asia and the Pacific (Hood and Peters with Lee 2003), and a follow-up on earlier Western European and North American studies was undertaken (Brans and Peters 2012), with adding Central and Eastern European countries to the investigation. Comparable data and analyses on rewards to high public office were provided in these academic works. This entry presents some of the key topics on rewards for high public officials that were discussed in these seminal studies and other relevant studies.

## Rewards Offered to High Public Office

People in high public office are rewarded in a variety of ways and in extremely complex manners, but there are two fundamental dimensions that help understand what kinds of rewards are offered to higher level public employees. The first dimension is formality, which is concerned with the extent to which the rewards are offered based on formal rules and regulations governing higher-level pay and perquisites. The most common form of this type of reward is base salary paid routinely for a position, which ordinary people can easily think of concerning rewards that go to topmost public officeholders. On the other hand, informal rewards, which are not laid down in any formal documents, are for the most part outside earnings that high public officials get as a result of holding public office through engaging in various business activities, such as consultancy work and paid speeches. The second dimension is tangibility, which is concerned with the extent to which the rewards are directly or indirectly associated with monetary benefits. In contrast to tangible rewards, such as salaries, allowances, non-cash job perks (e.g., houses, travel, cars) and retirement benefits, intangible rewards are represented by public respect, awards and satisfaction from contributing to society, which are often unattainable from the private sector. Such intangible rewards have no immediate monetary value, but they could have some real value for recipients and might be converted into tangible benefits. Thus, the boundaries between "tangible" and "intangible" are loose and difficult to establish.

There are two more important dimensions that are important to understand further reward structures to the top-level officials in the public sector – visibility and time. Visibility, which is underpinned by Jeremy Bentham's claim for publicity on "who gets what?" in high public office, is duly defined as the level of reward transparency. Visible rewards are transparent and easily understandable to citizens through readily available information, such as public accounts and official statistics, and any changes in remuneration are also clearly made public. At the other end of this dimension are invisible rewards, which are not open to public scrutiny, offered as non-cash compensation, or configured in complex ways (e.g., performance bonuses, tax exemption, payment on a reimbursement basis). Even though these kinds of invisible rewards are perfectly legal, they could create the circumstance where high public officeholders are able to earn substantially more than their base salary by way of allowances and entitlements. If so, the systems for rewarding high public officials are regarded as opaque, with an increasing likelihood that citizens' trust and confidence in governments and political systems are undermined. As many citizens do not want to see high salaries paid to high public officials because their pay is financed mainly by taxpayers' money, high public officeholders are prompted to conceal their real rewards from the eyes of the public through making invisible rewards more attractive to themselves. Using the iceberg analogy, this refers to the tip of a rewards iceberg since beneath the surface there is a large iceberg base of invisible benefits available to high public officials.

Time is concerned about whether the rewards from holding public office are earned while in office or after retirement. While many citizens may think that the rewards for people at the top

are offered only while they are in high public office, there is a variety of ways of rewarding them after they have left office. For example, ambassadorial and diplomatic posts can be offered to former senior ministers or MPs after retiring from politics. Retired senior judges and public servants may continue to retain positions on boards and commissions that they served as ex officio members while in office. Also, annuities and benefits in kind, some of which are lifelong, are available to former MPs and ministers, often extending to their survivors. Equally importantly, high public office paves the way for former officeholders to find better earning opportunities in subsequent careers. For example, before reaching mandatory retirement age, civil servants can secure lucrative post-retirement jobs at business companies or state-owned enterprises. Experience, expertise, and networks that high public officials have accumulated while in the public sector are beneficial to private sector organizations. Considering that a range of deferred rewards become available to high public officeholders upon retirement, the notion that high public officials suffer from lower rewards may be inaccurate from the perspective of lifetime earnings. At the same time, "revolving door" arrangements present concerns over conflicts between the public interest and private interests. Retired high public officials shift into business roles (e.g., taking up board directorships) in the industries that they once oversaw. In such arrangements, former high-level officials might make use of insider information as well as their connections and influence so that private companies that they now work for get an advantage in the relevant industry.

## Criteria for Reward Levels

The main concern with regard to rewards for high-level public officeholders is focused on how much they should be rewarded. For this concern, there are three major criteria of what Hood and Peters (1994, p. 222) call the "representativeness," "alimentation," and "market." The first criterion, harking back to classical democratic ideas, recommends that rewards of those holding high office should be equivalent to the average income of citizens. People at the top, be representative of those they rule, should have the same socioeconomic status as "ordinary" people by living an austere life. This criterion is often admired in an egalitarian democracy, emphasizing the value of equality between the rulers and the ruled.

The "alimentation" criterion says that high public officials should be rewarded with adequate pay enough to live a comfortable upper-middle-class life. This is a functionalist approach in that paying a sufficient level of reward reduces the risk of corruption by high public officeholders. This approach was suggested in Hegel's claim on the role of civil servants as advocates of universal societal interests over narrow sectional interests. This was also noted by Tocqueville, who was concerned that democracies having difficulty in recruiting competent individuals to governing positions as a result of paying meager salaries would turn back to aristocracies in which only wealthy people can afford to become high public officials. A similar view is found in Max Weber's ideal type of bureaucracy resting on a merit-based career system, which is characterized by a fixed salary, lifelong tenure, and pension rights upon retirement. Such principles of Weberian bureaucracy have been regarded as a precondition for good governance in the developing world.

The market criterion suggests that high public officials should be paid at the market rate for high quality personnel. As talented candidates are in short supply and their rewards are shaped also by the personnel market in the private sector, salaries for top positions in the public sector should be as high as those offered to private sector executives. Following Bentham's principle of utility, this criterion assumes that governments have to offer rewards suitable for the appropriate individuals with the highest responsibilities in the state. Since running a modern government is a highly professional and difficult job, governments need to attract and retain the necessary talent from the pool of human resources in the market. Using the private sector pay level as the point of reference for setting the salaries for high public officials has become increasingly common, as examined by Dekker (2013) from a philosophical angle. He

evaluated seven arguments on criteria for paying a certain level of salary by comparison with that of private sector executives. Five arguments are that high public officials should be paid less than private sector counterparts, and the remaining two support the view that high public officials should be paid as well as private sector executives. Driven by public sector reforms based on neoliberal ideas and managerialism, the importance of the market criterion has been increasingly stressed in determining the pay of those at the top since the late 1980s and early 1990s in particular in the Anglo-Saxon and the Nordic countries.

These three criteria above are incompatible, and there is no general consensus on which of these criteria are appropriate for determining the reward levels for high public office. In other words, answers to the question of what to pay them can only be determined politically.

## Patterns and Variations in Paying High Public Officials

Studies on rewards for high public office (Hood and Peters 1994; Hood and Peters with Lee 2003; Brans and Peters 2012) identified broad patterns and variations in paying high public office across time, across countries, across position categories and in comparison with private sector salaries. Space does not permit a discussion of all of them, so this entry highlights only some of the important patterns and variations pointed out in the studies covering the last four decades. To being with, even among wealthy countries, there are considerable differences in terms of a county's income level. Scandinavian countries – such as Norway and Sweden – provide their top officials with fairly modest levels of rewards against the wealth of the countries – levels of GDP per head. On the other hand, there are the cases (e.g., the UK, USA, and Italy) where the salaries of high public officials are relatively high by international standards, against their macroeconomic situations. Also, while equal levels of rewards across the offices are relatively maintained in the Scandinavian countries, there are countries in which the level of equality is low. In these countries, prime ministers or presidents are normally paid the highest, but there are also the cases (e.g., the UK and Norway) where top judges are better paid than heads of government.

The salaries of members of parliament and congress have tended to be lower than for other high public positions. The discounted pay for elected politicians, who are the most visible public officials in democratic societies, is considered due to voters' backlash against politicians' rewards, party competition for attacking politicians' pay rises before elections, or politicians' preference for re-election over higher pay. This pattern for politicians' visible rewards to be pushed down confirms Tocqueville's hypothesis that pay levels for top state officials would likely decrease due to popular democratic pressures. On the other hand, the rewards offered to upper level civil servants have increased markedly, with the exception of some jurisdictions (e.g., the USA), where civil service salaries are capped lower than Congressional salaries. Among established democracies of the West, there are a number of cases where top civil servants earn more than those in the highest public office, namely prime ministers or cabinet ministers. On the one hand, this trend is paradoxical given that public sector reforms since the 1980s sought to increase political control over subordinate bureaucrats, in terms of the relationship between ministers/politicians and civil servants, which Hood and Lodge (2006) refer to as "public service bargains." On the other hand, however, the shift from classical bureaucracy to business-like public management has been effective in pushing rewards for the administrative elite closer to those for private sector managers. Performance-related pay, a practice borrowed from the private sector, has become an important mechanism for this catch-up as well as the differential growth of rewards for top civil servants against other top positions in the public sector.

Rewards offered to high public officeholders, which are significantly higher than those for the average citizen, have been far below those offered to private sector executives. The rewards for public office have grown only moderately, as compared with rapidly rising incomes in the private sector. Remuneration discounts at the top of the

public sector relative to top private sector earnings are a dominant trend over the decades. Given the pay gap between public and private sectors, there have been calls for paying high public officials at rates comparable to those of top private sector positions with the same degree of workload, complexity, and responsibility, in order to attract and retain competent people in the public sector. Such claims, however, have not brought huge success in narrowing the gap.

Even though governments are becoming more open and transparent, the level of transparency in rewarding high public officials, in particular senior civil servants, has overall decreased, notwithstanding marked differences between countries. This trend is true of even countries that are ranked as highly transparent. Variable, performance-related rewards, paying senior bureaucrats based on their individualized performance contracts that are not disclosed to the public, have contributed to the loss of transparency over their rewards, as compared with the era of a unified permanent career service in which pay of civil servants was standardized on the basis of general grades, with everyone at the same grade receiving the same salary. Also, the proliferation of autonomous agencies (including public corporations), operating at arm's length of the government, has added another barrier to the transparency over the rewards system. Even in an age of transparency, information on real incomes and other invisible rewards offered to high public offices is not so readily available, and hence understanding actual levels of compensation for high public officials has become increasingly difficult.

## Explaining Variations in Rewards for High Public Officials

Various factors may account for differences in compensation level and types for high public office over time and between countries. Among them are cultural, economic, and political factors. Cultural factors are important as they shape society's attitudes toward pay and reward of those at the top. Broadly, there are two cultural traditions – egalitarian and hierarchical. In egalitarian cultures, which view people in high public office as representatives of those they rule, high public officials are expected to receive relatively low levels of rewards. Also, pay relativities between topmost public officials and the general public are comparatively compressed, along with narrowed income differentials across various offices at the top. This pattern is presented in the Scandinavian countries, including Norway and Sweden. On the other hand, in hierarchical cultures, found in such countries as France and Italy, there are considerable disparities in reward levels in the aforementioned aspects. In hierarchical cultures, rewards for political and administrative elites are provided as privileges guaranteed to high status groups rather than as rewards based on actual achievements (Eymeri-Douzans 2012, p. 78). If there is a cultural shift from hierarchism towards egalitarianism, it is expected that the hierarchist view of rewards for high public office is challenged by opposing viewpoints. Of highly relevance to cultural aspects is the level of public confidence towards high public officeholders, which could influence citizens' willingness to pay them higher rewards. Various surveys and studies have shown that public trust in government and political institutions has been declining virtually in all advanced democracies over the past half century. Rewarding high public officials with higher salaries is surely hard in countries with lower levels of popular trust, but it is more a function of the initial level of citizens' trust in government. If citizens' attitudes are respectful, there is moral justification for high public officials to receive comparatively high salaries; but if not, high public officials, having insufficient public support for higher salaries, may respond by taking a tactical approach, such as presenting their pay as less appealing to citizens.

Economic factors also play an important role in shaping rewards to top-level public officeholders. As reward levels may be related to changes in the

economy, there is no doubt that pay and reward of those at the top can rise significantly in countries that experienced rapid economic growth. However, for the most part, in western countries for the past several decades, high public officials have neither benefited from improved economic performance nor suffered from economic recessions and other macroeconomic challenges. This said, however, in times of fiscal retrenchment due to the 2008 global financial crisis, governments introduced austerity measures in order to restore budget balance and reduce debt burdens, and high public officials, especially in the countries that were most severely affected by the crisis, were more likely to suffer larger cuts in pay and/or benefits than rank-and-file public employees (OECD 2012), even though the monetary savings produced by the move were minimal. Such self-sacrifice by the top echelons fits what Dekker (2013, p. 119) calls the "example" rationale, which argues that high public officials should play the role of being an example-setter for all public sector employees sharing in the burden of fiscal belt-tightening. At the time of writing this entry, the Covid-19 pandemic – a "once-in-100 years" crisis – is still raging around the world, hence it is too early to tell whether the rewards for high public office were significantly affected by the historic disruption. Yet, it appears to be critical that people in high public office, regardless of being elected or not, take a voluntary pay cut in order to show solidarity with those affected by the outbreak. One might call their actions as a symbolic gesture, but the gesture could carry more weight on grounds of representativeness.

Political factors are associated with differences in political systems. The most well-known claim about the relationship between the nature of the political system and rewards to top-level officials is Tocqueville's hypothesis that a shift from autocracies to democracies sees moderation of salaries paid to top-level officials in the state. On a more empirical level, the pattern that elected politicians in the USA receive relatively high salaries as compared with bureaucrats or judges may reflect the characteristic of the US political system in which the representative and legislative function has greater importance in the country's policymaking process. In administrative or technocratic states, where the executive, or bureaucratic, branch plays a pivotal role in managing the economy and society, as compared with other branches of government, bureaucrats are better positioned to secure generous pay and benefits than those in other topmost positions, especially parliamentarians. In legalistic political systems, where government actions are justified based on legal grounds rather than commands from the elected government of the day, judges are more likely to be rewarded generously because their job is to check the constitutionality of government's actions and act as arbitrators between conflicting interests, from a politically independent position.

## Conclusion

It can be agreed that high public officials are all important figures in ensuring responsive, trustworthy, and competent public governance. But the rewards for those at the top are characterized as substantial variations in the level and types among office positions as well as across time and countries. The choices over remuneration of high public office reflect underlying political, cultural, and economic characteristics of each country and society. Thus, looking at rewards offered to people in the most important public offices helps us understand the dynamics within different political and administrative systems. In light of these aspects, rewards for high public office continue to be an important area of politics and public management.

## Synonyms

Compensation; Pay; Reputation

## Definition

The term "reward" comes from Middle English meed, mede ("reward, meed, recompense"). Rewards are a system to compensate performance of subjects and incentivize their motivation within organizations. Rewards system can include tangible elements (e.g., remuneration and other benefits) and intangible elements (e.g., reputation, job responsibility).

## Introduction

The concept of rewards is a main management topic developed from behavioral research in psychology. These studies analyze how people react to rewards and what motivates them to work in organizations. The concept of rewards is associated with the concept of motivation, which indicates the forces that energize, direct, and sustain behavior of individuals (Perry and Porter 1982). In general, rewards systems are based on processes, policies, and strategies to motivate subjects to achieve strategic goals and enhance the productivity of organizations (Armstrong 2007; Reif 1975). Put otherwise, the purpose of rewards systems is to improve the efficiency of organizations. In particular, the rewards of bureaucrats (members of the public administration) and politicians (individuals active in politics and in the public life of a nation; cf., Aberbach et al. 1981) are a vital topic for all governance systems to support motivation and performance of subjects in the public sector of a nation. A complete rewards strategy should achieve three goals:

- Motivate bureaucrats or politicians and compensate their performance
- Maintain loyalty of politicians or bureaucrats to public interest
- Support job satisfaction and happiness within the public sector

## Taxonomy and Theory of Rewards Systems

Generally speaking, rewards systems are a set of interdependent elements and processes aimed to compensate performance and motivate subjects in organizations. Specifically, rewards within public institutions have a powerful effect on performance, motivation, commitment, and satisfaction of public officials towards achieving strategic goals (Bowman 2010; O'Reilly et al. 1991). In public administration studies, rewards can be categorized considering different characteristics.

- As far as the feature of *measurability* is concerned, rewards can be:

– *Measurable* rewards include tangible elements measured through monetary units (e.g., pay) and/or other units of the metric system.
– *Unmeasurable* rewards include intangible elements difficult to measure, such as job responsibility, professionalism, etc.

- Rewards can also be categorized, considering their nature in relation to the job, into intrinsic and extrinsic.

– *Intrinsic rewards* are those that exist in the job itself and give personal satisfaction to individuals, such as autonomy, recognition, expense preference (e.g., leeway to invest monetary resources), trust, and empowerment.
– *Extrinsic rewards* are tangible and visible rewards given to individuals for achieving goals. They usually include elements, such as pay and fringe benefits, gifts, promotion, or advancement opportunities, etc. within organizations.

O'Reilly et al. (1991) have suggested that intrinsic rewards may be more salient for affective commitment, job involvement, and motivation in organizations to support satisfaction of subjects, whereas extrinsic rewards focus on performance and are more likely to be important for continuance commitment of organizations.

Hood and Peters (1994) categorize rewards with two dimensions: *formality* and *tangibility*. The first dimension, formality, deals with the extent to which the rewards of office are officially sanctioned and transparent. The second dimension of rewards systems is tangibility, when elements have a physical form that can be perceived and touched by subjects, vice versa rewards are intangible. These two dimensions of rewards systems generate a 2 × 2 matrix displaying each element in a cell (e.g., salary and retirement pension, medals, post governmental employment, and respect). The interpretative model by Hood and Peters (1994) includes only legal elements of rewards systems. This model can also be integrated with the dimension of *legality*, allowing further categorizing the elements of rewards systems into legal and illegal, in order to detect good and bad practices in real public sector contexts. Figure 1 shows the classification of the elements of rewards systems in bureaucracy and politics, considering the dimensions of legality, formality and tangibility (cf., Benati and Coccia 2017).

## Rewards Systems for Bureaucrats

Rewards systems for bureaucrats can be different across countries (cf., Benati and Coccia 2017; Hood et al. 2002; Brans and Peters 2012). Figure 1 includes, in the top right section, the four elements of the *legal* rewards system for bureaucrats (boxes with dotted lines):

- Compensation is a formal and tangible element of legal rewards for bureaucrats. This reward is extrinsic and measurable. Compensation can include basic categories: (a). Guaranteed pay – a fixed monetary reward paid by a government institution to bureaucrats, such as the base salary. Guaranteed pay also includes cash allowances (housing allowance, transport allowance, etc.), differentials (shift differentials, holiday differentials), and premiums (overtime, etc.). (b) Variable pay – non-fixed monetary reward paid by a government institution to bureaucrats that is contingent on discretion, performance, and/or results achieved; (c). Benefits – programs that a government institution uses to supplement bureaucrats' compensation, such as paid time off, medical insurance, etc.

**Rewards in Bureaucracy and Politics, Fig. 1** Classification of the elements of rewards systems for *bureaucrats* and *politicians* according to the dimensions of legality, formality, and tangibility

- Awards are a formal and intangible element of legal rewards for bureaucrats. An award is something given to a person in recognition of their excellence and best performance in certain fields or positions. An award may be accompanied by trophy, title, certificate, commemorative plaque, medal, badge, pin, or ribbon. It may also simply be a public acknowledgment of excellence, without any tangible token or prize.
- Post-government employment is an informal and tangible element of legal rewards for bureaucrats. In fact, the technical expertise of bureaucrats accumulated during their career in the public sector may increase their attractiveness to the private sector. For instance, a retired police official can work in private investigation companies, private security companies, etc.
- Reputation is an informal and intangible element of legal rewards for bureaucrats. Reputation (from the Latin word *reputationem*, which means "consideration") is the general belief or opinion held by other people regarding a person's specific characteristics or abilities in certain public positions.

In addition to legal rewards system, described above, other rewards elements may be illegal. Figure 1 also includes, in the bottom right section, the four elements of the *illegal* rewards system for bureaucrats (boxes with dotted lines).

- Gifts may be a formal and tangible rewards for bureaucrats. An "illegal gift" can be anything of considerable monetary value and/or other items of high intrinsic value. A gift offered

because of the employee's official position may create an appearance of using public office for private gain. The latent aim of the donor is to receive preferential treatment as a result of the gift. Common illegal gifts to bureaucrats are: expensive watches, jewelry, new cars, leisure travels, cheap or free renovation of private houses, houses sold at low prices, etc. However, items of little intrinsic value, such as modest refreshments or greeting cards, are *not* considered "illegal gifts."

- Abuse of authority may be a formal and intangible element of the illegal rewards system for bureaucrats. Abuse of authority is the use of legislated or otherwise authorized powers by government officials for illegitimate private gain. For criminal law, abuse of authority is an action performed by a subject who has been vested with public powers but that is opposite to the obligations imposed by law.
- Bribes may also be an informal and tangible element of the illegal rewards system for bureaucrats. Bribery is the act of giving money or other forms of recompense to public officials in exchange for an alteration of their behavior (to the benefit/interest of the giver) that public officials would otherwise not alter. In short, it is a gift bestowed to influence the public officials' conduct.
- Abuse of power may be an informal and intangible element of the illegal rewards system for bureaucrats. Abuse of power, in the form of "malfeasance in office" or "official misconduct," is the commission of an unlawful act done in an official capacity, which affects the performance of official duties.

Note that, depending on circumstances and laws, in the presence of illegal rewards, a bureaucrat may be imprisoned, fined, demoted, or dismissed for violating ethics provisions (cf., United States Office of Government ethics 2018).

### Rewards Systems for Politicians

We draw a broad analogy by extending the typologies of rewards for bureaucrats to politicians, but fully acknowledge that this is not a perfect analogy. Figure 1 also includes, in the top right section, the four elements of the *legal* rewards systems for politicians (see boxes with continuous lines).

- Allowance is a formal and tangible element of legal rewards for politicians. An allowance is an amount of money given or allotted at regular intervals for a specific purpose. The government institution supplying the allowance may put controls in place to make sure that the money is spent for that purpose only. Allowances may be travel expenses, daily allowance (also called "subsistence allowance"), general expenditure allowance, medical costs, end-of-term allowance, etc.
- Seat of power may be a formal and intangible element of legal rewards for politicians. Seats of power in politics are desired roles and/or official positions leading to personal recognition, such as being a secretary of state, prime minister, etc.
- Post-career positions are an informal and tangible element of legal rewards for politicians, such as being a member and/or president of nonprofit organizations, advisor for public and private organizations, etc.
- Reputation is an informal and intangible element of legal rewards also for politicians, similarly to bureaucrats.

In addition to elements of legal rewards systems for politicians, other elements may be illegal. These elements, similarly to the case of bureaucrats, may generate benefits in terms of private interests of politicians, their families, and friends. An example is that of financial interests.

Figure 1 also includes, in the bottom right section, the four elements of the *illegal* rewards system for politicians (see boxes with continuous lines).

- Gifts may also be a formal and tangible element of illegal rewards systems for politicians. This illegal element generates the benefits and ethical problems discussed above for bureaucrats.
- Abuse of authority may be a formal and intangible element of illegal rewards systems for politicians. In the form of political corruption,

it is the use of legislated powers for illegitimate private gain. Abuse of authority occurs when political leaders or superiors take advantage of their office and its powers against someone who is located in a situation of dependency or subordination. A form of abuse of authority occurs when politicians who accede to a post or a function leverage the power granted to them by law to their own benefit and/or for the sake of schadenfreude, and not to develop their public obligations properly.

- Bribes may also be an informal and tangible element of illegal rewards systems for politicians, similarly to bureaucrats.
- Finally, abuse of power is when politicians exert pressure through their political position on someone in a situation of subordination or in need in order to gain private benefits and personal satisfaction that can be financial, work-related (e.g., hiring friends and/or relatives), sexual, etc., while also abusing their political position to cover up the deed. Some examples are nepotism, taking money from a public fund, sexual affairs, etc.

## Utility Functions of Rewards Systems and Concluding Observations

On the basis of the theoretical framework presented above, the main elements of rewards systems in public administration, categorized in Fig. 1, can be systematized and generalized in utility functions for bureaucrats and politicians (in a legal setting). These functions represent a useful conceptual model for analytical studies in different environments over time and space.

| The utility function of *bureaucrats* UB is: $UB = f_1$ (*C, PW, SP, R, PR, AW, EP, . . .*) C = compensation; PW = power; SP = social position; R = reputation; PR = professionalism; AW = awards; EP = expense preference, etc. | The utility function of *politicians* UP is: $UP = f_2$ (*PW, SP, R, REL, PPC, PW, AL, SW, EP, . . .*) PW = power; SP = social position; R = reputation; REL = re-election; PPC = post-political career; PW = public welfare; AL = allowance; SW = seat of power; EP = expense preference, etc. |
|---|---|

These utility functions can be applied in public administration studies considering the following general observations about specific elements of rewards systems.

Firstly, compensation is a core tangible and measurable element of legal rewards systems to support motivation and performance of subjects in the public sector. Scholars argue that the pay-for-performance applied to compensate and motivate public officials can produce, by itself, only minimally productive performance in public sector and politics (cf., Benati and Coccia 2017). In fact, the literature suggests that pay-for-performance is only marginally related to public service satisfaction and motivation (Judge et al. 2010). In addition, pay-for-performance in public sector can produce hidden costs (such as, corruption, over-justification effect, etc.) or crowding-out effect, and, as a consequence, it may negatively affect performance of public officials and efficiency of institutions (Lepper and Greene 1978). Wright (2007, 60) also argues that: "the intrinsic rewards provided by the nature or function of the organization may be more important to public sector employees than – or compensate for the limited availability of – performance-related extrinsic rewards." In short, the public sector is less dependent on *utilitarian* incentives and it is vital to find a balance between extrinsic rewards (e.g., pay) and intrinsic rewards related to job satisfaction and commitment within organizations (cf., Coccia 2001; Crewson 1997, 504; Perry et al. 2010; Rainey 1982).

Secondly, politicians may also care about more than just the tangible elements of their rewards systems, such as monetary rewards (legal and illegal). They are also motivated by reputation: e.g., how a person's past actions affect future beliefs and behavior for re-election. The concern for reputation may motivate politicians to forego short-term gains. In contrast to politicians, bureaucrats care mainly about monetary rewards, financial incentives, and job security. In fact, in bureaucracy the Katzenberg-Eisner game can be applied to analyze individual monetary gains. Moreover, the subjects in public administration may also be interested in other types of intangible rewards represented by schadenfreude, full control, illegal gifts, etc.

Overall, then, this theoretical framework here may be a comprehensive model to explain and generalize many elements of rewards systems in bureaucracy and politics. However, the domain of rewards systems in public administration includes a variety of elements associated with different cultures, civil laws, and rules of law across countries. In particular, the role and function of bureaucrats and politicians and, as a consequence, the rewards systems, can change when considering Western or Eastern countries, more or less democratic nations, etc. Moreover, the boundaries between tangible and intangible rewards, and/or legal and illegal rewards are not always clear, such as for gifts. Hence, the taxonomy of rewards systems presented here can be adequate in some cases but less in others, due to diversity of rewards systems across nations and organizations over time and space.

# Right of Access to Administrative Documents in the Italian Military Courts

Fabio Ratto Trabucco
University of Venice, Venice, Italy

## Synonyms

Denial of access; Italy; Public administration; Right of access; Transparency

## Definitions

The right of access to administrative documents is granted to each citizen in order to ensure an efficient development of the relationships between Government and Public Administration, yet above all in order to ensure full transparency as regards the activity of the latter (See: Schwarze (2015), as well as Rowat (1978)). The right at issue was introduced in the Italian legal system by means of the Law of 7 August 1990, No. 241 (See: Girella (2017), Bausilio (2016), as well as Giannini (2013) and Colapietro (2012)).

## The Gross Denials of Access to Administrative Documents

In Italy, access to documentary resources has always gone hand in hand with certain legitimate circumstances (which, according to the original wording of Law 241/1990, consist in a "juridical relevant situation"). Such a case should not be confused with the so-called right of civic access, recently introduced by means of the Legislative Decree of 14 March 2013, No. 33 (later modified by the following Legislative Decree of 25 May 2016, No. 97, also known as the Italian Freedom of Information Act, since it follows the pattern of the American homologous law issued on 4 July 1966). The right of civic access grants the widest access to every citizen to the information concerning both organization and activities of public administrations.

Regarding cases of specious, not pertinent denials provided by public administrations on the basis of clearly illegitimate motivations for the sole purpose of refusing to show given documents as requested, the jurisprudence was at first allowed to supervise over the event of an increase in terms of office management tasks. Indeed, such an event, as a consequence of a previous increase of applications for access to a given document, may ultimately result, also due to economic reasons, in a denial, potentially causing, furthermore, the petitioner to bear fiscal responsibilities. It follows that public administrations should rigorously consider this option, though without subsuming it in case of lack of consistency.

In particular, "it is necessary to evaluate as rigorously as possible suitable circumstances which could justify the denial to duplicate a given document. It is, moreover, necessary to avoid arguments such as economic sustainability profiles in terms of costs related to the substantial denial, which, incidentally, have to be borne by the petitioner pursuant to Art. 25, para. 1, of Law No. 241/1990." Thus, both organizational and structural constraints cannot be taken into account as objective limits to the denial, in case of access requests submitted by private entities relying on their own resources (Council of state, section IV, 10 April 2009, No. 2243; loosing party: municipality of Dobbiaco).

Similarly, the alleged existence of "a concrete, objective impossibility to bear material liability" cannot represent an acceptable reason for a denial. Indeed, public administrations are obliged to equip themselves with a proper bureaucratic apparatus capable of fulfilling their duties and responsibilities (regional administrative court of Sardinia, section I, 29 April 2003, No. 495; loosing party: municipality of Villasor, convicted to bear costs amounting to 1,500 Euros, plus VAT costs and those for the Lawyers' National Provident Fund).

On appeal, the Council of state sentenced one more time that local authorities, as well as all public administrations, must fulfill every obligation being up to them by providing themselves with any necessary means to accomplish this end (personnel, technical equipment, various supplies) (Council of state, section V, 4 May 2004, No. 2716).

It was also asserted that another unacceptable argument is the one linked to the economic burden that could arise from "the reproduction of drawings, tables and drafts," resulting in a potential "slowdown in bureaucratic daily tasks" as a direct consequence of the difficult gathering process of single documents and archival researches. For this reason, "as validly pointed out by the regional administrative court of Sardinia in the above-mentioned judgement [No. 495/2003], municipal offices cannot deny access to administrative documents with regard to the impossibility to issue them due to the sheer amount of requested information. Every administration shall, indeed,

possess a proper bureaucratic apparatus capable of fulfilling its duties and responsibilities" (regional administrative court of Emilia-Romagna, Bologna, section II, 29 January 2004, No. 140; loosing party: municipality of Castel Maggiore, convicted to bear costs amounting to 2,000 Euros).

Moving now to "a hypothetical situation of access denial to given documents in the form of photocopies, the denial itself should be regarded as illegitimate, since a similar request would not unnecessarily burden the regular office workload of the administration. This is because every administration shall possess a proper bureaucratic apparatus capable of fulfilling its duties and responsibilities. The considerable amount of requested documents could at most justify a gradual issuing of the copies in the long term" (regional administrative court of Sardinia, section II, 12 January 2007, No. 29; loosing party: municipality of Burcei).

Moreover, administrative jurisprudence clarified that the process of responding to the duplication request "could be carried out during an undefined timeframe in order not to interfere with ordinary office tasks, in the event of requests entailing onerous procedures." As regards this application process, it emerged that it was issued a provision which was later deemed to be illegitimate, that is, the provision denying access to the list of building permits granted over a certain period of time (in particular: from June 2002 to September 2005), as well as the list of public works subcontracted in the same period. Therefore, the event of an interruption of the implementation of ordinary office tasks can represent a valid reason to delay the issuing process of the copies up to a later point in time. That being said, such an argument cannot be exploited as an excuse to deny access to administrative documents (Council of state, section IV, 21 August 2006, No. 4855; loosing party: municipality of Solofra, convicted to bear costs amounting to 3,000 Euros).

Eventually, it was stated that "a potential significant amount of access requests submitted by municipal councillors cannot be considered as legitimate limit or, even worse, as legitimate obstacle to the exercise of the right being discussed, on the understanding that it is provided for a proper request processing in the most reasonable and adequate way, in accordance with operational needs of each office" (Council of state, section V, 17 September 2010, No. 6963; loosing party: municipality of Praia a Mare).

In terms of compliance with the legislation on access regulation to administrative documents, it is precisely thanks to these precedents that it is proved the existence of a certain attitude of resistance within Public Administration, especially when it comes at implementing principles established by law as regards the exercise of the denial tool.

Particularly, instances of purely specious, gross denials are usually reported within the scope of central state administrations, from the Ministries as a whole to some national public sector institutions, owing to the bureaucratic pressure weighing on them. Likewise, such a problem involves small local administrations, as extensively discussed in the previous sections. The explanation for this phenomenon lies in the fact that institutions still rely on an insufficient knowledge of regulatory and jurisprudential principles as far as access regulations are concerned.

## The Case of Gross Denials of Access to Administrative Documents at Military Court of Verona

Speaking of central administrations, the case of the military court of Verona stands out as an emblematic example. The court serves as peripheral, subsidiary judicial body of the Ministry of Defence; it exercises penal military justice towards members of the military who commit crimes in northern Italy (See: Intelisano (2016)). The court has been frequently involved in repeated instances of illegitimate access denial to administrative documents concerning labor relations of civilian employees. The Presidency of the Council of Ministers supplied a specific Commission for Access to Administrative Documents (C.A.D.A.) in order to ascertain the abovementioned instances of access denial, taking also focused, definitive measures. None of these

measures was contested at the regional administrative court of Lazio on behalf of its respective ministry.

Turning to the details, the Commission ascertained that the court had to do with seventeen instances of illegitimate access denial to administrative documents regarding labor relations during a 4-year period, precisely from 27 March 2013 to 19 October 2017 (The documents at issue, although subject to privacy protection, are available on: http://indipendent.academia.edu/ProvvedimentiGarantePrivacyTribunalemilitaredi Verona (Access on 15 June 2018)). Such documents had been requested for tutelary purposes, so did the Commission as well.

The above-described situation forms part of a broader framework including repeated violations of the most basic principles of transparency and data advertising. This is even more compounded by the fact that access denials were arranged by the highest members of the institution. Indeed, although enjoying a special military nature, which is different from an ordinary one, the military court shall be bound by a sense of duty as regards both knowledge and implementation of jurisprudential legislation. However, it should be also noted that serious infringements of law due to ignorance or inexcusable negligence are important elements of magisterial accountability pursuant to Art. 2, para. 1g, Legislative Decree No. 109/2006. Similar infringements can be ascertained and ultimately sanctioned by the respective self-governing body, in this case by the Council of the military magistrature, chaired by the President of the Supreme Court of Cassation and composed by military Attorney, two military judges, and one lawyer.

Beyond that, penal military jurisprudence has embarked on an antiquated, antihistorical approach, whose main features are high operating costs of the apparatus, considering the poor conditions of court workloads after the suspension of compulsory military service since the very first day of 2005 (on 31 December 2016, the three military courts accounted for 203 pending penal proceedings, 68 of which were registered in the Veronese court alone) (As regards the failure to rationalize the branch of military justice, although it is the case of an under-exploited as much as questionable measure, see D. Brunelli (2015)). The military court of Verona "sticks out" also for numerous, serious, discriminatory instances and for unlawful processing instances of civilian employees' personal data, as pointed out in several parliamentary questions by the Member of Parliament Turco (Mixed Group; already member of the Five Star Movement) to the Minister of Defence: 9 July 2014, No. 4-05466 and 4-05467; 15 July 2014, No. 4-05528; 7 August 2014, No. 5-03469; 17 December 2015, No. 5-07239; 22 March 2017, No. 5-10907; 26 July 2017, No. 5-11986 (Collated documents are available on: http://independent.academia.edu/InterrogazioniGiustiziaMilitare (Access on 15 June 2018)). Not only each of these parliamentary questions was systematically ignored, but also no disciplinary action was taken against the President of the military court of Verona responsible for the abovementioned infringements; so far, they have never been held accountable for any violation of subjective rights. It can, therefore, be stated that what was actually carried out was a fully-fledged, *de plano* dismissal of the self-governing body involved. Indeed, it was acknowledged that "the magistrate, being the head of the office, acted properly and diligently" (deliberation of the Council of the military magistrature of 20 June 2017, No. 6097, related to President Massimo Bocchini). With regard to the serious nature of harms deriving from specious access denials to administrative documents, it is sufficient to remind that already during the plenary session of the Council of state which took place on 20 April 2006, No. 7, it was managed to arrive at an important conclusion. On this occasion indeed, the right of access was recognized as a subjective circumstance which "offers to the interested party powers of a procedural nature aimed at safeguarding in an instrumental way a juridical relevant interest (rights or interests)," rather than providing any kind of ultimate advantage.

In particular, the ascertained instances of illegitimate personal data processing, in both cases of common and sensitive data and judicial and healthcare one, produced, as a consequence, the unlawful acquisition and preservation of

administrative documents. Together with the principles laid down in Legislative Decree No. 196/2003, this is how a framework of unlawful practice of employment relationships took shape. In practical terms, it occurred that during a period of approximately 3 years and 6 months, that is, from 10 April 2014 to 20 October 2017, the Italian Data Protection Authority ascertained five liability cases of illegitimate personal, judicial, and healthcare data processing. Indeed, it happened that, in case of sickness, employees' physicians were directly contacted (provision of 10 April 2014, No. 187, website document No. 3214369).

All of this took place amid the general silence of both press and national political institutions, avoiding to discuss, in that way, the abolition of such a pointless special jurisdiction (See: Covelli (2013)). It should be also added that this issue was the subject of many judgments by the Supreme Court of Cassation, which ruled on the illegitimacy concerning cases of legal guarantee of soldiers' freedom of expression (On soldiers' twice-neglected freedom of expression by the judgements of military justice, later annulled by the Supreme court of Cassation, see F. Ratto Trabucco (2015 and 2018)) (Supreme Court of Cassation, section I, 20 August 2014, No. 36045, plus 23 May 2013, No. 22051: so-called Surano case). Giovanni Surano was a soldier of the Italian finance police, who was twice held guilty of defamation to the detriment of his superiors by writing an online critical post, then he was convicted by military trial judges. Both judgments were eventually annulled by the Supreme Court of Cassation, which, incidentally, is not embodied by military judges (See G. Surano (2014) (Access on 15 June 2018)).

Moreover, military courts "stood out" for the practice of granting senseless, aberrant privileges also to nonmagisterial, civilian personnel, by allowing access to state-owned service accommodation. Particularly, it should be highlighted that nonmagisterial, civilian personnel making up ordinary justice is not entitled to do so. Even more seriously, such a right was denied to a category of disabled employees working for the Ministry of Defence, that are blind telephone operators, as proved by the parliamentary question of 26 March 2014, No. 4/04189, sought by the deputy Rizzo (Five Star Movement). The leftist former Minister of Defence Roberta Pinotti, in turn, replied with a contradictory, tardive response dated 19 September 2017. On this occasion, the Minister pictured himself as a cast-iron supporter of military justice. However, during the previous legislature, he stood up for diametrically opposing views, signing even a constitutional draft law in favor of abolishing penal military jurisdiction (XVI legislature, Senate Act No. 3423 of 25 July 2012: constitutional draft law carrying amendments to articles 102 and 103 of the Constitution as regards the abolition of military courts and the foundation of a specialized section for military crimes within ordinary courts).

## The Useless Military Justice

At this juncture, evidence of a small yet influential, military magisterial lobby stands out clearly. Such a lobby relies on the support of the academic field, especially since many military magistrates do have prominent positions in some universities of the capital: precisely similar external appointments, unrelated to the juridical sphere, for which sometimes people do not even get any remuneration, allow members of this lobby to interweave a wide range of relationships with all kinds of personalities (politicians, scholars, state managers, and officials, entrepreneurs etc.). It is sufficient to point out that many different institutions (not only universities) are crowded with military magistrates; on the contrary, their presence in military judicial offices is becoming increasingly rare. Military magistrates are often entrusted with important decision-makings in the course of lawsuits of an economic value amounting even to millions, for example sport or financial trials. It is, therefore, undoubtedly that their main goal consists in gaining more and more influence in order to assert themselves, on the one hand, on the other one to preserve the role of military justice, albeit pointless by now. In terms of quantity, there are only about 51 military magistrates (one out tenured) (Available on: http://portalegiustiziamilitare. difesa.it/default.aspx?

Id=1061 (access on 25 March 2018)), still they do everything possible to avoid their "burdensome" repositioning in the broader context of penal ordinary jurisdiction, which, incidentally, is chronically understaffed and overloaded with judicial proceedings. So, the event of such a repositioning would entail for military magistrates a tangible risk to be overwhelmed with congruous workloads, as it however should be.

As a result, the attempt to remove bodies of military justice has turned out to be a failure so far. Their judicial activity could be suspended *sine die*, even though the Constitution provides for their being in force; as a matter of fact, resorting to constitutional abolition as in the case of compulsory military service would be impossible. Military courts are foreseen in Art. 103, para. 3, of the Constitution, and military service is likewise provided as mandatory in Art. 52, para. 2, of the Fundamental Charter. However, nothing prevented legislators from introducing a professional army by resorting to ordinary law, without altering the Constitution in any way (Law of 14 November 2000, No. 331, implemented by the Legislative Decree of 8 May 2001, No. 215, later modified by Law of 23 August 2004, No. 226, with effect from 1 January 2005, incorporated into the Code of military justice; see Legislative Decree of 15 March 2010, No. 66).

Typical features of military justice institutions are poor workload conditions in spite of considerable operating costs (See: Materi (2017)). Refer to the statistics published on the occasion of the opening of the 2014, 2015, 2016, and 2017 military judicial years on the web portal of military justice: the data shows an infinitesimal number of proceedings, which is, moreover, progressively decreasing compared to the one ascribable to ordinary justice. Indeed, as at 31 December 2013, the military courts of Naples, Rome, and Verona accounted for 200 pending proceedings; the military court of appeal accounted instead for 84 proceedings. As at 31 December 2014, the number of first instance proceedings was 195, whereas there were only 65 appeal proceedings. As at 15 December 2015, there were 219 first instance proceedings along with 61 appeal proceedings. Eventually, as at 31 December 2016, 203 cases of first instance military penal proceedings were recorded against only 47 appeal proceedings. Lastly, as at 31 December 2017, only 163 cases of first instance military penal proceedings were recorded against just 60 proceedings (Available on: http://portalegiustiziamilitare.difesa.it/default.aspx?Id=713 (Access on 15 June 2018)).

Moreover, there are frequent substantial interruptions later proved to be erroneous as to lawfulness, a poor competency standards framework producing internal acts of a controversial, i.e., harmful. In 2013, the Supreme Court of Cassation – composed only of nonmilitary judges – decided on a total of 65 appeals, against the same number of judgments by the military court of appeal; 13 of these appeal cases were eventually annulled (10 with committal for trial and three without it), that is 20%. In 2014, 29 cases of annulments (18 with committal for trial and 11 without it) were recorded out of a total of 116 appeals, that is, 25%. In 2015, there were 14 annulments (seven with committal for trial, just as many without it), out of a total of 60 appeals, that is, 23%. Lastly, in 2016, 10 annulment cases (three with committal for trial and seven without it) were recorded out of a total of 68 appeals, that is, 15%. In 2017, 17 annulment cases (13 with committal for trial and four without it) were recorded out of a total of 63 appeals, that is, the 25%, like one in four judgment of the military court of appeal was unlawful.

Lastly, the Italian military justice indicate the trend at the violation of subjective rights, particularly the right to privacy in connection also to sensitive data and not to mention the presence of a corporative disciplinary regime for military magistrates in relation to ordinary jurisdiction (See: Ratto Trabucco (2012), as well as De Vergottini (2007)). As regards instead various cases of discriminatory, unlawful processing of civilian employees' personal data by the highest members of the military court of Verona, see further parliamentary questions of 9 July 2014, No. 4-05466 e 4-05467, 15 July 2014, No. 4-05528, 7 August 2014, No. 5-03469, 17 December 2015, No. 5-07239, 15 February 2017, No. 5-10594, 22 March 2017,

No. 5-10907, and 26 July 2017, No. 5-11986 (Available on: http://aic.camera.it/aic/advanced.html (access 25 March 2018)).

Reference should be made to the circular issued by the military Prosecutor of Verona on 17 October 2013, which arguably established that members of each headquarter were compelled to inform the responsible inquiring authority in case of "absence from work with a duration exceeding thirty days, although justified by a legitimate medical certificate." As the document being discussed gave rise to controversy, it was necessary to amend it by introducing some clarifications. As a consequence, a supplementary note was published on 11 November 2013.

Additionally, the constitutional reform Boschi-Renzi, which fell through ruinously after the negative result of the *referendum* held on 4 December 2016, did not even include the abolition of military judicial bodies. It is likely that such a failure was provoked by the self-perpetuating halo gravitating towards the lobby of military magistrature and affecting somehow the executive branch as well (See: Rivello (2015)). This was despite many rationalization attempts made by the Government during the XVII legislature, along with numerous parliamentary questions which, theoretically, should have produced the reduction of military judicial bodies, yet the executive branch did not keep the promise (See: Bottacchiari (2010), as well as Taverna and Tisci (2010)). See also parliamentary questions with relative positive replies concerning the launching of the reduction plan, parliamentary questions of 3 October 2013, No. 5/01121 and 30 April 2014, No. 4/04687. On the contrary, inspection instances dated 24 February 2016, No. 4/05342, 17 March 2016, No. 4/12562, 23 June 2016, No. 3/02950 and 27 July 2016, No. 2/01442, went all unanswered. Moreover, unanswered inspection instances of 8 October 2014, No. 5-03747 and 31 March 2015, No. 5-05206, deal with operating costs of judicial offices according to each belonging section, even in the absence of concrete management needs, considering the limited workload amounts.

The Government put the subject matter of rationalizing military judicial bodies on the agenda five times during the XIII legislature. As a result, the so-called *reductio ad unum* of the military courts of Naples, Rome, and Verona was carried out together with the abolition of military courts of Napoli and Verona and of military supervision court: on 9 October 2013 and 17 March 2015, the Senate gave its approval, Nos. 9/01015/002 and 0/1577/21/01, whereas the Chamber of Deputies did so on 24 October 2013, 31 July 2014 and 19 December 2015, Nos. 9/01682-A/028, 9/02486-AR/121 and 9/03444-A/179.

Eventually, mention should be also made to draft laws which have never been analyzed (See: Colamussi (2015)): Act of the Chamber of Deputies No. 2679-*undecies* was filed during the XIII legislature without starting any examination. The document at issue was actually a sort of excerpt of the draft Stability Law of 2015 aiming at the reduction of military judicial bodies (Act of the Chamber of Deputies No. 796 was instead the result of a parliamentary initiative). Constitutional draft laws, deriving from parliamentary initiatives as well, No. 1519 and 2657, together with Acts of the Senate No. 317, 609, and 766 found themselves in a similar situation. In particular, they deal with the abolition of military penal jurisdiction by amending Art. 103 of the Constitution (See: Custodero (2018)).

## Conclusion

Military magistrates spend the majority of their free time, giving all of themselves, as perspicaciously as fruitfully they can, for the ultimate goal consisting in preserving their respective judicial offices (three inquiring offices and first instance judging courts in Naples, Rome and Verona, one military court of appeal with related military Prosecutor's office in Rome in addition to the military Prosecutor's office at the Supreme Court of Cassation). Simultaneously, it seems that the most basic requirements in terms of transparency and privacy get implemented without turning a hair, as, by way of example, unequivocally proved by the significant amount of negative judgments the military court of Verona has "collected" over time. Indeed, both Commission for Access to Administrative Documents and Italian Data

Protection Authority expressed themselves negatively regarding access denials to administrative documents and privacy protection policies carried out by the Veronese military court. That being said, it is important not to draw generalizations without losing sight of the fact that military magistrates, taken individually, may have both professional qualities and a sound set of competences. Incontrovertible facts suggest, however, the classification of the abovementioned court not only as the "black sheep" of Italian Public Administration concerning access to administrative data, but also within judicial offices as a whole, even if only speaking of military ones, and not of these making part of ordinary justice.

## Synonyms

Crises; Dangers; Enterprises; Institutions; Threats

## Definition

Risk and organization refers to the threats, hazards, and dangers that institutions and organizations face.

## Introduction

Risk and uncertainty are two important concepts that address the threats and opportunities of human projects in modern social life. The concept of risk originally referred to an opportunity for gain or for loss resulting from a human project and was often associated with financial ventures,

gambling, and other gain-seeking activities. In late modernity, the term has come to refer principally to the threat of danger, harm, or damage resulting from human activities. The original meaning of risk referred to the ability of technical experts to rationally calculate the probability or likelihood of favorable or unfavorable outcomes of a phenomenon. In late modernity, the meaning has shifted and now refers to risks that cannot be known, that is, to unquantifiable uncertainties.

This entry provides an overview of the concept of risk and its use in organizational research. The entry addresses the key domains of risk research and the key theories and perspectives used to understand risk in organizations. Sociocultural theories of risk that have recently emerged in social science are given special consideration. The shift from risk management to risk regulation in public administration is discussed, and emerging directions in organizational risk research are described.

## Perspectives on Risk

The Positivist Perspective. Research on risk has been conducted within several scholarly traditions and frameworks. Positivism is arguably the dominant approach for understanding risk. Positivism assumes there is an objective reality that can be understood and discovered by scientific methods. The goal is to discover factual knowledge or truth. To do so, the researcher uses methods similar to those used in natural science to develop hypotheses, identify variables, test relations between variables, and verify or falsify hypotheses. From this view, risks are objective phenomena that can be explained and managed using rational, calculative procedures that create scientific knowledge.

One important domain for positivist research is business risk. This refers to potential threats to the financial performance and existence or survival of an organization or firm (Shrivastava 1995). Business risk research addresses the problem of how organizational actors, especially managers, respond to objective business risks or fail to do so. It mainly focuses on the analysis of risks that threaten the existence or performance of business firms. Business risk can be measured using quantitative firm or industry data and has mainly been addressed in the context of market risk, which is objective and measurable through general industry information. This risk is assumed to exist independent of social actors' interpretations, and expert knowledge of risk is given precedence over lay knowledge and concerns.

Business risk defined as the possibility of organizational failure or death has been a fundamental concern of population ecology theory (Hannan and Freeman 1977) that examines the environmental conditions under which populations of organizations fail or survive. This conception of risk is also a main focus of many conceptualizations of risk in other mainstream organization theories including institutional theory, transaction cost economics, and social network theory. Risk is also a matter of risk taking by organizational actors that may cause organizational failure. Studies in this domain have analyzed risk seeking versus risk avoidance of firms and have found evidence that family-owned firms are risk seeking when this risk does not endanger their socio-emotional wealth, which includes family identity and influence, and are risk averse when family identities and influence are threatened.

Risk management is a second area of positivist research on risks. This research focuses on how organizational actors, especially managers, can rationally manage and respond to risks, crises, and disasters (Bowman and Kunreuther 1988). This approach assumes managers can recognize the "objective" indicators of risk and respond rationally to them; thus, risk management research offers "rational" techniques managers can use to prevent, control, or mitigate risk. The signs of an organizational disaster are often evident to managers. Problems occur when the signs of risk are not grasped by managers due to their beliefs, when organizational actors do not act upon the signs they have noticed and when no one in the organization has an understanding of the big picture that the signs indicate. Some studies within this research stream also focus explicitly on what managers should do to deal with post-crisis conditions.

Risk management research also addresses how managers can rationally respond to organizational risk (Shrivastava 1995). Organizational risk is seen as a phenomenon that can be assessed and controlled through rational management. It assumes risk has an objective meaning held in common by all social actors and offers "rational" suggestions for managers to follow. Every manager needs to discover objective risks and manage risks accordingly. There is no need to understand the meaning of risk for social members or how established social institutions and practices shape risk management since this is the job of managers in individual organizations.

A third domain involves organizational disasters. Disasters are realized risks. Disaster research examines the sources of disasters in risks that are objective in nature and become problems when social actors fail to accurately assess the true risks (Turner 1976). This research identifies social and organizational factors that cause disasters. Disasters result from the accumulation of small events and accidents over time and no disaster has a single cause. Organizational culture is one potential source of disasters, and the two space shuttle disasters have been widely studied. These disasters were found to be rooted in NASA's culture of objectivity that privileged quantitative risk measures, disregarded biases inherent in quantitative data, and overlooked qualitative issues including social interactions between managers and engineers (Feldman 2004). Organizational structure can also lead to disasters. In the Challenger disaster, the problems that preceded the disasters could not be detected by regulators and regulated organizations within NASA that were autonomous and interdependent. The autonomy of the regulated organizations decreased the effectiveness of the regulators to gather information on their operations. Interdependence led to similarities in perceptions of problems and created opportunities for the regulated organizations to distort information (Vaughan 1999). Further, disasters are embedded within broad social and political structures. The reasons things go wrong in socially organized settings are the fact that political, competitive, regulatory, and cultural environments systematically interact with organizations and organizational members to cause disasters. Disaster management should go beyond the concept of human error and pay attention to institutional environments (Vaughan 1990). Finally, several researchers have found that disasters are caused by group dynamics. Problems that have been found include narrowly defined purpose, directive leadership, and failure to sense an ill-defined problem. Climbing team members often overlook the value of other goals besides reaching the summit including survival. When constrained by a directive leadership, climbers have failed to identify and respond to their disastrous situation.

Disaster research thus asks why and how organizational actors could not foresee the upcoming disaster and recognize the real risk involved. It also examines how organizational actors interpret and understand potential sources of disasters (Turner 1976) although, somewhat paradoxically, disaster research often argues that organizational actors' interpretations are inaccurate or incomplete. Otherwise, the disaster would not have occurred. Hence, disaster research generally takes the view that lay explanations of disasters are inadequate and that technical experts and scientists have the ability to undertake an "objective" analysis of disasters that produces a superior understanding of these events.

Disaster research offers a useful but narrow picture of disasters. It tends to blame human actors rather than established institutions and practices, and it fails to recognize that organizations are not simply technical systems but are also meaning systems that organizational actors use to interpret processes that might lead to disasters. The imposition of a rational perspective onto the subjective meanings of organizational actors is likely to provide only a partial analysis and limited suggestions on how to undertake disaster and risk management.

A final positivist perspective on accidents and disasters is the theory of "normal accidents" (Perrow 1999). Normal accidents theory takes a systems perspective that addresses how organizational contexts with high interactive complexity (little slack with tight coupling) generate unplanned and unexpected interactions among systems components that produce unforeseen

accidents. Normal accidents involve situations where unplanned interactions among technological components and social, political, and economic factors can lead to multiple component failures that result in accidents. Normal accidents are irremediable and unavoidable outcomes of complex technologies that generate risk. Normal accidents have been studied in a number of industries including nuclear power, petrochemicals, aircraft, and space missions.

The Interpretive Perspective. The interpretive perspective assumes that members of a group or society actively interpret the world and use these interpretations as bases for actions. Thus, it is important to understand the subjective meanings members of society have for risk phenomena in order to understand their actions. The goal of interpretivism is to understand and describe members' meanings and local contexts by using members' concepts. In interpretivism, the researcher analyzes verbal and nonverbal actions with a focus on systematic divergences in meanings.

Risk sensemaking research provides important examples of the interpretive approach (Gephart et al. 2009). Interpretive research asks the question of how social actors interpret and explain adverse organizational events. One interpretive approach relies on the sociological conception of sensemaking as an ongoing process that gives meaning to human activities and events. When sensemaking practices that are used to provide meaning are disrupted, confusion occurs and sensemaking is needed to restore a sense of social order.

Research has been conducted into how organizational actors in public inquiries make sense of an organizational disaster (a pipeline explosion) and construct related risks (Gephart 1993). Contradictory accounts frequently emerge in inquiries. The different sensemaking logics used by each social group or institution participating in the hearing – government, business, workers, and local residents – influence the interpretations made and the recommended actions to control risk. Quantitative sensemaking using numbers to retrospectively interpret risks is integral to the successful, rhetorical construction of risks as controllable technical issues. This sensemaking normalizes risks and legitimates claims that corporations and government agencies are able to successfully control risks using standard operating procedures (Gephart 2007).

There is also a psychological view of how disruptions in sensemaking trigger further sensemaking that shapes emergent organizational responses to risks and crises (Weick 2001). A high-risk situation might result in a breakdown in common meanings which no longer make sense. In the Bhopal disaster in which more than 3000 people were killed due to a release of toxic gas from a chemical factory, the low-probability and high-consequence events that emerged challenged existing meanings of social actors and paralyzed their sensemaking. The actors tried to make sense of those events by enacting an interpretation developed in the past that they took to be appropriate in the here and now and then acted on the events based on their sensemaking. Enactment might enhance understanding and help restore sense, but it might also worsen the crisis situation and further limit sensemaking if the sensemaking that is directed at the situation is lost and the situation spirals out of control. In the well-known Mann Gulch fire disaster where several young firefighters perished, an interrelated collapse of sensemaking and role structure led to a sudden loss of the meaning of the organizational world and disrupted interrelations between organizational actors. The collapse occurred because initially firefighters expected the fire was not likely to become a major fire. When the wind suddenly shifted, the firefighters were forced to flee a raging fire that rapidly overcame them. This collapse of sensemaking and meaning was termed a "cosmology episode," in which organizational actors lost their sense of order and thus lacked the means to rebuild that sense. In Mann Gulch, the collapse of meaning turned the crisis event into a disaster in which 13 firefighters were killed by the fire.

The politics of sensemaking is another theme. The political sensemaking model (Gephart 1984) highlights the role of divergent interests (of government, industry, and public) in competition with one another to produce the dominant interpretation of a disaster event. Hence, the

process of risk construction does not simply involve interpretation and negotiation but also contention and conflict. This process produces a dominant interpretation that serves particular interests, and, as a result, disaster-triggering events might be constructed as not risky.

Interpretive research has also addressed how organizational actors construct future events as sources of acceptable risks that are controllable through use of plans (Clarke 1999). This research distinguishes between functional and symbolic plans. Functional plans are based on a meaningful history that allows organizational actors to make reasonable predictions about future events. Fantasy documents are rhetorical tools used because they offer political advantage by creating the impression expert plans can reduce uncertainty and prevent risks from emerging. Under conditions of high uncertainty when there is no meaningful history to draw upon and when important aspects of the future are unknown, plans take on symbolic functions that create a sense of control over future events by transforming them into risks with known probabilities and effective means to prevent or resolve problems that emerge.

Interpretive research thus examines how social actors experience and give meaning to organizational activities that seem risky to them. It goes beyond the narrow objectivity-oriented perspective of positivist research by analyzing local meanings and experiences that constitute a situated rationality. It has uncovered different ways sensemaking can be disrupted and ways it can be sustained during high-risk situations and crises. Limitations are that most interpretive research on risk is focused at the microlevel of the individual actor or group and provides limited concern with political processes that preselect risks faced by society.

## Sociocultural Theories of Risk

Sociocultural theories (Lupton 1999) emphasize how social and cultural contexts influence the meanings given to risk and the ways it is understood, negotiated, and interpreted. There are three sociocultural theories of importance to organizational analysis. The cultural-symbolic approach argues risk is never fully objective since it is meaningful only in the context of belief systems and moral positions. Risks are made meaningful through culture, and this meaning is not static but undergoes change as it is reconstructed and negotiated. This view brings a collective perspective on risk. Certain cultures conceive particular activities and phenomena as risky based in their cultural beliefs and logic. Cultural notions of purity, pollution, and danger provide grounds for risk. Risks are connected to the moral principles of culture and are phenomena that cross cultural boundaries and have potential to produce disorder. In individualistic societies, agency is assigned to individuals who are held responsible for failing to take actions to avoid risks and are blamed when risks and accidents occur. Thus, the cultural-symbolic perspective highlights the political, moral, and aesthetic choices that produce risks. This emphasis on the cultural basis of risks and variations of risk across cultures provides an alternative to psychological conceptions of risk.

The cultural-symbolic perspective focuses on understanding how risks are conceived by social actors and how they become relevant to organizations. The perspective examines risk events that transgress social boundaries and disrupt social order (Douglas and Wildavsky 1982). This approach leads to efforts to understand how phenomena become labeled as risky and how the meaning of risks relates to organizational and institutional forms and practices. Different groups hold different conceptions of risk, and when these groups interact, e.g., in a public inquiry, they often engage in extensive negotiation to resolve divergent risk conceptions.

## Risk Society

The risk society perspective proposes a major premise: the success of wealth production in modern societies has led to a situation where the by-products and harms of wealth generation have accumulated to the point that management of these risks has become a basic organizing

principle for society at large (Beck 1992). Real risks have increased in society and conceptions of risk have changed, thus making risk a major focus of everyday life. Traditional approaches to risk calculation now fail to work because risks are no longer local and readily identifiable by groups. People may require scientific knowledge for detection of risks. And risks are based on decisions made by organizations and individuals but become widely distributed to citizens who struggle with corporations over selection and production of risks. People have to constantly deal with risks, insecurities, and uncertainties that are outside of their control. Thus, risk is now seen as the possibility of future damage resulting from decisions by organizations and institutions.

One key process in risk society is individualization, the process by which individuals have become the center of their own life project and orient to this project as a fundamental basis for identity and action. People must create their own biographies in a social context where traditions have declined and new ways of life are emerging and changing. Now, people must personally choose among risks and be responsible for one's risk-related decisions even though they are dependent on conditions outside their control or require knowledge they do not have for dealing with risk. This requires people to cope with anxiety and insecurity and to engage in intense negotiation with others. Individualization therefore creates new risks. People must learn to live with and use a calculative attitude informed by expert knowledge. The complexity of technological society requires trust in the system of experts, but most people have no control over this system. Risks have thus changed character and have more impact across time and space. They have also become more politicized in everyday life.

## Governmentality

Governmentality, a concept grounded in Michel Foucault's (1980, 1990) work on modern social regulation and control, addresses how risk operates in the context of neoliberalism in late modernity. Risk in this view is created by institutional discourses and practices and is based in a calculative rationality. Governments conceive of citizens as a population that must be managed if wealth and social welfare are to be created. As a neoliberal practice, governmentality endorses individual freedom and rights and rejects excessive intervention by the state.

The governmentality concept fits very well in the context of a highly individualized risk society. Governmentality provides a mechanism to shift risks from organizational challenges to issues of individual control. Individuals are constructed as rational social actors capable of self-control. This self-control is supported by administrative and scientific experts or professionals who use their technical knowledge to identify individuals who are subject to particular risks. When individuals are considered at risk, they are expected to obtain the professional advice of experts in both public and private organizations in order to deal with the risk.

Being "at risk" indicates that individuals deviate from normal practices formulated and institutionalized by public and private authorities in most spheres of life including education, occupation, family, health, childcare, retirement, and even vacation. Deviations are minimized with the help of institutional knowledge, which individuals internalize as their own and use to support their conduct. Thus, individuals act autonomously to avoid deviations and associated risks. Together with risk avoidance, this self-regulation facilitates value creation both for individuals and for the society. Individuals become the means as well as the focus of value and control. Failure to self-regulate is considered irrational. It is an individual failure in the ongoing accomplishment of the project of the self. It is a lifetime project for individuals to be responsible for creating and protecting the value of their self. Individuals are expected to develop the necessary skills to detect and manage risks as this will facilitate rational and responsible action. These skills are expected to be used for each individual's life project supported by the help of public and private institutions.

Risk management has thus become a form of self management that responds to and yet disguises the collective character of risks.

Organizations provide institutionalized advice but their propensity to create and distribute risks is overlooked. Risk and organizations are decoupled through the individualization of risks, by shifting the focus from risk production, which seems unavoidable at the organizational level, to risk mitigation, which seems possible at the individual level. Risks are natural by-products of organizations. Their role in risk management is shaped by a cost-benefit framework that is the key institutional norm that limits most organizations' conduct. Organizations are considered rational when they integrate risks into the cost-benefit framework.

In contrast, individuals are required to calculate the risks to themselves and organizations cannot do this for them. This is part of a never-ending process of individualization that is ongoing as organizations reproduce risks, multiply current risks, and create new risks. Society is reproduced in the form of individuals concerned with their own biographies who are tied to other individuals with whom they have calculative relationships and formalized practices. Where risks are no longer calculable, individuals still have to be calculative.

Cost-benefit frameworks treat risks as unavoidable. Risks are calculable only within a cost-benefit analysis that treats risks as objectively quantifiable. Calculation focuses mainly on costs. If benefits including risk management tools more than offset risks, then risks are determined to be acceptable risks and may also be viewed as effectively controllable. In this sense, organizations still seem to act with the pre-risk society parameters based on the idea that risks can be objectively calculated and controlled by the experts in organizations including scientific and administrative professionals. But everyday risk decisions are shifted to the individual level, and not all individuals in a society are or can be a risk expert. Hence, persons are expected to consult with a risk expert when facing risk because this is seen by experts as the only way to overcome layperson biases based on subjective understandings and feelings. Yet this shifts responsibility for organizational failure onto individuals who are harmed or impacted by risks since they are held responsible for inadequate handling of risks.

This individual-based management of risks is justified by a neoliberal approach to public policy, which emphasizes individual freedom. State intervention is viewed as limiting freedom of choice and is minimized as much as possible. But overlooking the organizational level in an effort to overemphasize the individual level of risk management also undermines the legitimacy of public policy. Still, this reduces the cost of governance as it puts the burden on individuals. Risks become both a source and a means of individualized management that is justified with the need to manage risks, while risks signal the need to move from the deviant to the normal.

Individualized management of risk might itself constitute a risk for the sustainability of organizations and the society based on the functions of those organizations. First, the source of risks – organizations – is not the primary focus of regulation although organizations are subject to certain risk regulations and institutional normalizations. Both public and private organizations producing economic value or regulating value production are themselves responsible for most of the risks individuals are exposed to. Normalization efforts sponsored by organizations and directed at individuals lead to identification of new areas of deviance and a cumulative increase in the number of risks. And most individuals do not have the resources to address risks. Thus, normalization by organizations fails to address most of the risks that the population faces in substantive ways, and individuals' choices are based either on imposition by others or on self-ignorance. And organizations' non-risk products including knowledge and choice are not evenly distributed among individuals. On the contrary, unequal allocation is the norm and thus individual choice is in most cases an imposed one.

Accordingly, a successful mechanism of risk management necessitates a public policy of risk governance involving individual citizens, organizations, and government. For example, lack of alternative employment opportunities is an issue for individuals when they evaluate positions in high-risk organizations. These risks are viewed

as unavoidable costs to be balanced with benefits and uses of some risk management tools. Unemployment risk is a local issue to be addressed by the government. If this issue can be successfully solved by creating alternative opportunities, high-risk organizations may have to provide safer conditions together with better pay. Otherwise, individuals might have to accept the high-risk job and may seem themselves to have failed in terms of risk avoidance if an accident occurs. This is also a failure for organizations as accidents damage their cost-benefit ratios, indicating also that cost-benefit frameworks may not work. In other words, risk management does not have much chance to succeed when it is compartmentalized among citizens, organizations, and government.

The consequence of the shift in society from risk management to risk governance is that organizations are constrained by risk-benefit frameworks. Individual citizens are constrained by lack of resources and are not able to deal with current risks. Risk regulation needs to go beyond enforcement of regulations on organizations or encouraging individuals to normalize risks. A comprehensive approach to risk management at the governmental level needs to be developed. This approach should combine local knowledge of citizens and expert knowledge of organizations.

There is a need, then, for substantive mechanisms of public involvement in the decision-making processes of private or public organizational projects and in the development of risk management tools used to prevent or mitigate the risks created and reproduced by the existing organizational projects. Organizational projects are not simply economic activities; they are political activities and have to be subject to public legitimation. Conventional mechanisms of legislation and regulation are not effective in this respect. Substantive intervention is possible only with more direct participation by individual citizens and citizen groups. Risk governance needs to shift sub-political fields and risk-related activities into the core of political processes and to insure legitimation of risks is accomplished by direct public approval.

## Conclusion

The study of risk in organizations is being actively pursued by a number of researchers examining a wide range of risks and organizations. The field is becoming more fully developed as different streams of risk research are formed around particular perspectives on risks as well as specific risk contexts. In the future, there is need for better integration of the fields of risk, crisis management, and emergency management, since all of these fields are implicated when risks emerge and transform into crises or disasters that require emergency services for containment and mitigation. There is also need for research to explore how the multiple levels of social organization – individuals, groups, organizations, institutions, and societies – operate in crises and disasters since all levels are involved, but most research studies only 1 or 2 levels of social order. Finally, the field of risk analysis has long been driven by technical concerns with risk analysis and cost-benefit calculations. In the future, social behavior needs to be better explored and understood, and a compassionate lens needs to be focused on victims of risks and crises to insure the human face of risk impacts is better considered.

# Risk and Performance in Public Sector

Iordanis Eleftheriadis and Vasilios Vyttas
Department of Business Administration,
University of Macedonia, Thessaloniki, Greece

## Synonyms

Efficiency; Performance; Performance measurement; Risk; Risk management

## Definition

In public administration, two forms of performance are distinguished: *policy performance*, which is related to the success of services provided to cover the needs of citizens and *management performance* which refers to the effectiveness of management in the public organization (Bovaird 1996).

Definitions of performance vary in the literature. Some authors define it as "quantitative representation of quality and quantity of the input, output and the results of the organizations or their programs in their social framework" (Neely et al. 1995). Others define it as the quantification process of effectiveness and efficiency of activities (Johnsen 2005).

Risk is defined as variability in performance results, in which case the aim of risk management is elimination of low performances (Slywotzky and Drzik 2005).

## Introduction

The new economic crisis has already created the new characteristics and conditions for public administration implementation and assessment. The public sector in many countries today faces a major challenge: to adapt to the new global reality of "doing more with less" or "doing less with less." At the same time, risk management has developed into a dominant concept of vital importance for the survival of public organizations as a new methodological approach to decision-making for public officials.

The present study primarily aims at the development of an integrated model of estimating the financial and operational risks constantly faced by public sector organizations. The model also examines the performance of these organizations using a set of nonfinancial variables which define it. The research model is supplemented by the analysis of a series of factors which contribute to the revelation of hidden potentials and characteristics of higher level public officials which jointly aggregate to define these concepts.

## Method

The methodology adopted in this research is the quantitative one, which will be based on the collection of primary data by means of a

questionnaire. In the field of management, the scientific questionnaire is clearly dominant in frequency as well as in effectiveness (Saunders et al. 2003).

More specifically, the study of the relevant literature points to the conclusion that performance measurement (Richard et al. 2009) as well as risk measurement (Akerboom and Maes 2006) by means of questionnaire are well documented. Our research has the following aims: First, to introduce a valid and reliable instrument which can be used by public sector organizations for performance and risk assessment. Secondly, to link administration characteristics of public sector organizations with performance. Third, to link perceived organizational risk with performance in public sector organizations. If the aims of the present research are met, monitoring the function of public sector organizations will become more efficient, through the measurement of performance and risk. Furthermore, the research will highlight the characteristics of administrators of public organizations displaying increased performance. This will facilitate the optimal selection of administrative personnel, thus increasing public organization performance.

## Questionnaire Structure

The questionnaire consists of four parts:

The first part of the questionnaire records demographic information of the sample and is divided into two units. The basic scale for performance measurement is the scale created Prof. Spangenberg and Prof. Theron (2011) to measure the performance of unit managers officers. Unit manager officer responses help define the current state of the organizational unit in matters of effectiveness, while information is used to attain a clear perception of the levels of unit effectiveness and performance, in order to formulate a plan to increase performance (Spangenberg and Theron 2002). When these aims are met, executives appear ready to implement initiatives for performance improvement, as well as for the stabilization of improvements in the course of time. The third part attempts to examine and assess the previously mentioned two types of risk faced by the organization: economic and operational risk.

**Operational Risk**: The proposed scale aims at assessing operational risk by measuring the manager's perception of it. This "perceived operational risk" scale is an instrument that aims to help organizations' risk assessment while at the same time it will provide valuable insight into the manager's sense of risk. Measuring risk with the help of a questionnaire survey is a concept that has been tested with significant success in the past (Akerboom and Maes 2006; Ciavarelli et al. 2001). The basis for the development of this instrument was the work of Akerboom and Maes, which had proposed a questionnaire capable of assessing the respondent's perceptions of organizational risk factors. More specifically, the scale aims at measuring a manager's sense of organizational risk by asking him/her to rate the course of 17 organizational variables; whether they have increased, decreased, or have remained as they were. The respondents are called to rate the course of these organizational variables two times. Therefore, there are two operational risk scales, the first that measures "present risk" by recording how key organizational variables have evolved during the recent years and the second that measures "future risk" by recording how the managers think that those variables will evolve in the future. The initial concept of the operational risk scale included 17 organizational variables, which were selected after studying Akerboom and Maes work (Akerboom and Maes 2006), as well as a series of other publications focusing on organizational risk perceptions (Ciavarelli et al. 2001). The Organizational Risk Factor Questionnaire (ORFQ) of Akerboom and Maes (2006) includes 52 items split into six factors. Because these questions and factors were designed to fit the private business sector, they would not be suitable for measuring risk factors in public sector without large scale adaptation and customization. It was therefore deemed as more productive to use Akerboom and Maes (2006) scale as a general basis upon which to base a largely prototypical scale. In order to create the measurement instrument, the following process was followed: first, a group of five Greek Public sector managers with

good knowledge of the English language was drafted via random sampling from a list of 30 Greek Public Sector managers. Then, the managers received a copy of Akerboom and Maes (2006) publication as well as summaries of other relevant publications (Ciavarelli et al. 2001) and were given 1 week's time to study the material. An open discussion session ensued in which each manager was free to report variables that he/she thought were indicative of a public organization's operational risk. All variables on which more than 50% of the participants agreed were included in the new instrument. The final list included 17 items. The exact wording of each was agreed upon by all participants.

**Economic Risk**: In order to measure economic risk, the questionnaire uses the scale which was proposed by the AGA (Association of Government Accountants in the United States of America). AGA is an official body which established the Partnership for Intergovernmental Management and Accountability, with the purpose of detecting and prioritizing critical economic issues or threats, and suggesting measures or actions to approach these issues (AGA 2009). Because the AGA scale was specifically tailored for the USA public sector it was again deemed necessary, as in the case of operational risk, to develop a new instrument specifically modified so as to fit the Greek public sector. In order to do so, the same methodology was followed as in the case of operational risk. It must be noted that this is the same group of managers utilized in the creation of the organizational risk instrument described before. The two open discussion sessions which led to the creation of both instruments took place on the same day. Following a reliability analysis, and in order to increase reliability, a number of questions was removed so that the final questionnaire consists of 11 questions.

Beyond the performance and risk scales, in the last part of the research we finalized the remaining scales measuring public organization manager abilities and characteristics. In order to formulate our research model and the new risk and performance measuring instrument, it was deemed essential to clarify the factors that influence and shape these two variables. The scales are as follows: The first scale selected for measuring unit managers' officers' general risk-taking propensity was "General Risk Propensity in Multifaceted Business Decisions" (Hung and Tangpong 2010), which is the evolution of the Jaworski and Kohli (1993) scale (Hung and Tangpong 2010). The second scale that will measure the degree of responsibility of unit managers and the degree to which they feel they "own" the organization they manage is the Psychological Ownership scale of (Fay et al. 2004). The third scale selected to measure unit managers officers' willingness to take initiatives was Personal Initiative scale (Frese and Fay 2001). The fourth scale, which measures the manager's aspiration of professional development, is Day and Allen's Career Motivation Scale (Day and Allen 2004). Fifth, in order to measure the manager's self-confidence, we selected the Generalized Self-Efficacy Scale (Schwarzer and Hallum 2008). Finally, for the measurement of executive job satisfaction we chose the Generic Job Satisfaction Scale of (Macdonald and MacIntyre 1997).

## Sampling

In the final stage of the evaluation of the present questionnaire, 23 questionnaires were distributed to managers of Greek state organizations and other public or parastatal bodies. Of the 23 questionnaires, 15 were answered and returned (ten after a face-to-face interview and five via e-mail), constituting a percentage of 65%. The sample is considered sufficient for the statistical processing and reliability analysis of the measurement scale used in the present survey. More specifically, the statistical analysis of the pilot test included: Missing Values Analysis and Reliability Analysis-Cronbach's alpha (α).

## Research Process

The data collection was carried out mainly through face-to-face interviews with the managers of the Greek state agencies and other public institutions and the wider public sector. Also

**Risk and Performance in Public Sector, Table 1** Final report

| Scale | Cronbach's alpha | Assessment |
|---|---|---|
| Part A- Scale b13: Assessment of organization growth in the recent past | 0,879 | Good |
| Part A- Scale b14: Assessment of future growth potential of the organization | 0,823 | Good |
| Part B- Scale 1: Economic risk 11 questions | 0,808 | Good |
| Part B- Scale 2: General operational risk- present | 0,869 | Good |
| Part B- Scale 3: General operational risk- future | 0,821 | Good |
| Part C- PI Scale-<br>Factor: Production and efficiency | 0,850 | Good |
| Part C- PI Scale-<br>Factor: Core people processes | 0,775 | Acceptable |
| Part C- PI Scale-<br>Factor: Climate of the work unit | 0,881 | Good |
| Part C- PI Scale-<br>Factor: Employee satisfaction | 0,897 | Good |
| Part C- PI Scale-<br>Factor: Adaptability | 0,831 | Good |
| Part C- PI Scale-Factor: Capacity | 0,823 | Good |
| Part C- PI Scale-Factor: Market standing | 0,815 | Good |
| Part C- PI Scale-Factor: Projected future growth | 0,902 | Excellent |
| Part C- PI Scale-Total scale | 0,849 | Good |
| Part D- Scale 1: Risk propensity | 0,790 | Acceptable |
| Part D- Scale 2: Personal initiative | 0,939 | Excellent |
| Part D- Scale 3: Psychological ownership | 0,877 | Good |
| Part D- Scale 4: Job satisfaction | 0,862 | Good |
| Part D- Scale 5: Self efficacy | 0,886 | Good |
| Part D- Scale 6- Factor 1: Career insight | 0,812 | Good |
| Part D- Scale 6- Factor 2: Career resilience | 0,895 | Good |
| Part D- Scale 6- Factor 3: Career identity | 0,935 | Excellent |
| Part D- Scale 6 Total: Career motivation | 0,957 | Excellent |

some data were collected by sending the questionnaire via e-mail to the managers. The face-to-face interviews were conducted for the managers whose e-mails were not unavailable or had a technical problem and who accepted with willingness to participate in the research. The remaining managers who responded via email preferred this due to lack of time to participate in an interview.

## Results

### Total Reliability Report

The questionnaire comprises 12 scales, one of which includes 3 subscales and one 8. In total, 23 scales/subscales were analyzed for reliability. Of these, only one scale, economic risk, required the omission of four questions for its reliability to be good. Overall, 9 scales indicated good reliability, 2 excellent, and 1 acceptable. Of the subscales, 8 had good reliability, 2 excellent, and 1 acceptable. The reliability of all scales and subscales is presented in Table 1.

## Conclusions

The present research attempted the development of a comprehensive model of risk and performance management in the public sector. The model was checked for reliability and proved to have good reliability features with the exception of economic risk scale, from which it was necessary to omit four questions in order for its reliability to be good.

The final contribution of this research lies in the proposal of a valid and reliable instrument that can be used by public sector organizations to measure and link organizational performance and organizational risk, and to highlight as well as relate the particular individual manager characteristics of public sector organizations with the performance of the unit they manage. Further research is required in order to harness public sector performance and risk more efficiently. For the creation of the instrument proposed by the present research, a number of variables have been studied including, executive burn out, remuneration satisfaction, etc. In the international literature, there is a wealth of variables that describe levels of the variables under research.

# Risk Management in Japan

Hideaki Shiroyama
Graduate School for Law and Politics, The University of Tokyo, Tokyo, Japan

## Synonyms

Food safety; Regulatory reform; Risk management

## Definitions

Japanese government recently experienced major regulatory reform of risk management in food safety and nuclear safety management.

## Introduction

Japanese government experienced major regulatory reform in the area of food safety and nuclear

safety after the turn of the century. Both reforms were initiated by the accidents such as BSE scandal and Fukushima nuclear power accident in 2011. In this section, after clarifying the political nature of risk management decision, processes and contents of regulatory reform of food safety and nuclear safety were analyzed and comparative analysis is undertaken at the conclusion.

## Political Nature of Risk Management

Risk management is the activity of judging where the acceptable level of a risk lies, based on risk assessment, and implementing management decisions (Shiroyama 2011, 2016b). Risk assessment is generally thought of in terms of occurrence probability multiplied by the scale of damage. For such an assessment, it is essential to have scientific knowledge based on epidemiological data or animal experiment data. As a matter of fact, discretionary judgment for risk assessment varies depending on whether damage is defined as the number of deaths of people or the number of victims such as casualties or patients, and so on. In addition, when looking at a large-scale and systemic damage, risk assessment can be different depending on whether we regard a large-scale systematic disaster as what is qualitatively different or not.

To judge acceptable level of risk management decision, it is also necessary to take into account the balance between risks and benefits regarding the relevant technology depending on the characteristics of local social context. Both risks and benefits have many facets and what risks and benefits the political process for technology focuses on is fluid and can be different depending on local context. There are many cases where the same technology has different risks and benefits when another dimension – that of international relations – is added. For example, domestically the technology of nuclear energy is energy technology; its benefit is to provide energy and its risk concerns safety. Adding the international dimension and considering the fact that most oil, the major energy source, is imported from the Middle East, the option of nuclear power generation brings with it the benefit of enhanced energy security. In contrast, the possession of technology of nuclear power generation, in particular the technology of nuclear fuel cycles, enhances the risk of nuclear proliferation internationally. In addition, benefits of technology in particular vary depending on the purpose of a society. For example, conventionally nuclear power generation is regarded benefiting only the energy supply; however, as global warming is considered a social problem, it is recognized that there is an additional benefit: the technology will not discharge the global warming-related substance $CO_2$. On the other hand, the technology of coal-fired power generation was portrayed in the social context of global warming as a risk because it discharges $CO_2$. However, among the growing interest in energy security because of the increase of oil prices, it is recognized that the use of coal-fired power generation provides the benefit of energy security, because it uses coal, whose production sites are distributed all over the world compared to those of other fuels.

When judging benefits, it is important to consider also the distributive implications: to whom do the benefits belong. Even if the overall benefits are large, if they are concentrated on limited actors, a society can refuse such a technology. Nuclear power generation and genetically modified food, for example, have been difficult to be accepted by societies, even though numerical risk assessment shows that their overall risks are comparative low. One of the reasons is that direct beneficiaries of these technologies are limited enterprises.

In addition, there is uncertainty in both risks and benefits. Of course, the range of uncertainty can be decreased as science progresses. However, it is hard to remove uncertainty completely. Therefore, a question is how society judges certain uncertainties. A policy choice about whether to choose a precautionary approach or a so-called no regret policy represents a difference in attitude of local jurisdictions toward such uncertainties. A precautionary approach is an attitude of taking precautionary measures such as regulation, even when there is uncertainty, because the potential damage is large when something goes wrong. In contrast, a no regret policy represents an attitude that, when there is uncertainty about risks, does not take measures to prevent a problem, but only

takes measures that are meaningful when nothing happens. Which of these two attitudes is chosen is a question of policy choice in society.

The judgment of the balance between risks and benefits and the judgment of uncertainty are social discretionary judgment depending on local contexts; however, in a real political process, there can be ways where scientific judgment is used as a guarantee to avoid blame for the use of discretion. When technology is used in society, a variety of risks and benefits needs to be considered. What social judgment should be made is an issue, requiring the consideration of such a variety of risks and benefits in local context. In addition, it is pointed out that there are a variety of trade-offs in such social judgment. A risk trade-off means that efforts to reduce a particular risk will increase another risk as a result. For example, when the body weight of a car is made lighter to increase the fuel efficiency, such an effort sometimes lessens the safety of the car because the body becomes weakly guarded against collision. In this case, the risks of global warming and energy security are reduced, but the risk for the safety of a car increases. Additionally, when substitutes of Freon gas that destroys the ozone layer first appeared in market, there was one that reduced the destruction of the ozone layer but facilitated global warming. In this case, the risk of the destruction of the ozone layer and the risk of global warming are in a trade-off relationship. The existence of a trade-off like this is often revealed after a certain amount of time passes. For example, it took a long time after the development of Freon gas until the effect of the destruction of the ozone layer was revealed (Graham and Wiener 1997).

When social judgment is made relating to a technology, sometimes a discussion on values needs to be had in addition to a judgment of risks and benefits, which inevitably needs to incorporate local social context. In social judgment about technology, risks and benefits are explicitly and broadly shown and then comprehensive judgment can be made. However, when a comprehensive judgment is made, an important factor should be considered that functions as a crucial and final determinant, no matter what other benefits and risks there are. For example, there are value problems that are related to human rights or human dignity. Such problems are often important issues especially in the fields of life science and genetic engineering that are progressing rapidly these days.

After the turn of the century, Japan experienced the two major accidents relating to food safety and nuclear safety, i.e., BSE and Fukushima nuclear accident, and undertook institutional reform of risk regulation. As examples of risk management reform, those two cases are comparatively analyzed and remaining issues are picked up in the following sections.

## Regulatory Reform of Food Safety in Japan

Japanese BSE crisis happened in September 2001. The BSE Investigation Committee was set up in November 2001 jointly by MHLW (Ministry of Health, Labor and Welfare) and MAFF (Ministry of Agriculture, Forest and Fishery) and finalized a report in April 2002. It called for introduction of risk analysis into food safety policymaking. It is this recommendation that laid the foundation for the reform. Original idea of regulatory regime was formulated in June 2002 by the Cabinet Meeting of Relevant Ministers on Food Safety Administration. Several procedural and organizational principles of the idea of FSC (Food Safety Commission) were defined in its final decision. First, food safety administration should be based on the method of risk analysis consisted of risk assessment, risk management, and risk communication. Second, risk assessment should be organizationally as well as functionally separated from risk management. According to this separation, FSC as a risk assessment organization should be located in the Cabinet Office (Hirakawa et al. 2005).

Along with deliberation at the Cabinet Meeting of Relevant Ministers, politicians also started discussions about new food safety policy. Liberal Democratic Party (LDP) set up the Special Committee on Food Safety in its Policy Research Council in March 2002, and announced its final decision report in May 2002. Democratic Party, an

opposition party, also formulated a proposal for new food safety administration in August 2002. While the conclusions of two parties are somehow different in details, both were almost the same as that of Cabinet Meeting of Relevant Ministers. The Food Safety Basic Law was established in May 2003 and entered into force in July 2003. Along with this, the Food Sanitation Law and other relevant laws were amended.

Besides the establishment of FSC and Food Safety Basic Law, reorganization of existing structure of food administration at MAFF and MHLW was also undertaken in order to enhance their risk management activities. On the side of MAFF, the "Renewal Plan of 'Food' and 'Agriculture'" was designed and announced in April 2002, including establishing the Food Safety and Consumer Affairs Bureau (FSCAB) in MAFF. This reorganization symbolizes the shift of focal point of MAFF's administration from producers' side to consumers' side. The mission of FSCAB is to conduct risk management independently of other sections for industrial promotion. On the side of MHLW, Department of Food Safety was set up in the Pharmaceutical and Food Safety Bureau (former Pharmaceutical Bureau).

In July 2003, the FSC was established in the Cabinet Office. Its principal mission is to undertake risk assessment, along with risk communication and emergency response, independently of risk management conducted by the MAFF and the MHLW. Reformation of regulatory administrative system for food safety, introducing risk analysis regime, i.e., the organizational as well as functional separation of risk assessment and risk management, is thought to be the key to remedy the distrust to the regulatory regime.

## Regulatory Reform of Nuclear Safety in Japan

Following the Fukushima nuclear accident in March 2011, the Cabinet adopted a Basic Policy on the Reform of an Organization in Charge of Nuclear Safety Regulation in August 2011 without waiting for reports from the Investigation Committee on the Accident at the Fukushima Nuclear Power Stations and other bodies. The Basic Policy called for establishing a nuclear safety regulatory body as an external agency of the Environment Ministry to restore trust in the system by separating nuclear regulation and promotion; integrating all nuclear safety regulatory operations to improve efficiency; establishing a risk management system; and developing human resources for nuclear safety. Based on the ideas, the Cabinet adopted a draft bill to reform the nuclear energy regulatory system in January 2012. The draft bill included the provisions such as establishing a Nuclear Regulation Agency within the Environment Ministry, clearly separated from the Ministry of Economy, Trade and Industry (METI) and other bodies promoting nuclear energy; integrating the Radiation Council under the NRA. Unlike the usual government deliberation process, the process was politician-led in the sense that the Cabinet and, in particular, the national minister in charge, took the initiative rather than depending on an advisory committee (Shiroyama 2015).

Deliberations were simultaneously taking place in the Diet. The LDP, the opposition party at the time, set up in December 2011 a project team for reforming the nuclear energy regulatory system. At the end of March 2012, the LDP project team came out with a proposal which the LDP, together with the Komei Party, presented as a counter proposal to the government's draft law. This proposal called for ensuring the org anization's independence from nuclear power operators and government bodies in charge of economic and other policies; integrating functions concerning monitoring, security, and safeguards; and establishing a new career path for personnel working in the field of nuclear safety.

The governing and opposition parties worked to reach a compromise and the Act to Establish the Nuclear Regulation Authority was passed in June 2012. In September 2012, the government appointed five NRA members and had it start its activities although the Diet approval of the NRA members only came in February 2013. Due to its origins in the compromise between government's bill and the opposition's counterproposal, the nuclear safety regulatory framework that

finally emerged had the following characteristics (Shiroyama 2016a):

First, the NRA was established as a so-called "Article 3 commission" with independent authority and proper personnel. To emphasize the NRA's independence from METI, the government's bill had proposed establishing a Nuclear Regulatory Authority within the Ministry of the Environment as its external agency. In a sense, this was a practical proposal that made use of the vertical compartmentalization already existing in the bureaucracy. During the deliberation, some had proposed placing the Authority under the Cabinet Office, but due to the many different functions covered by the Cabinet Office, this idea was ultimately deemed unsuitable. The opposition's draft bill, meanwhile, favored ensuring the Authority's independence not only from METI, but also from other government entities, including the Ministry of the Environment who might promote nuclear energy as mitigation strategy of global warming. To ensure independence in personnel matters, the opposition proposed setting up the NRA under Article 3 of the Administrative Organ Law as an administrative body whose members could exercise their authority independently and whose appointments would be approved by the Diet, rather than as an agency whose head would be appointed by the environment minister. Although making appointments to the Authority subject to Diet approval risked politicizing personnel appointments, this provision did make it possible to regulate nuclear safety in a non-partisan manner. Ultimately, the NRA was, as per the government's bill, placed under the Ministry of the Environment rather than the Cabinet Office, but it was designated as an Article 3 commission.

Second, in addition to the NRA's existing responsibility for regulating nuclear safety, functions related to counterterrorism and other security challenges, functions of the Radiation Council, safeguards to ensure nonproliferation, and environmental monitoring were also placed under the NRA jurisdiction. Both the government and the opposition's draft bills called for integrating responsibility for counterterrorism and other security measures into the existing nuclear regulatory function under the NRA. This was regarded as an appropriate provision, because the safety requirements for managing spent nuclear fuel and installing seawater cooling pumps, emergency power generators, and other equipment overlap with security requirements for counterterrorism. However, the opposition's draft went further in that it also called for and succeeded in integrating environmental monitoring and safeguards for nonproliferation. This was an appropriate motion, given that other countries tend to consider safeguard measures and security regulation as unified missions to prevent nuclear materials from being used to make weapons, and countries like the United States and France handle safeguard measures, security regulation, and safety regulation at the same regulatory body. Finally, responsibility for environmental monitoring and safeguard measures was transferred from the Ministry of Education, Culture, Sports, Science and Technology (MEXT) to the NRA in April 2013.

In addition, Article 6, Clause 4 of the Supplementary Provisions of the Act to Establish the Nuclear Regulation Authority provides that "in order for the Nuclear Regulation Authority to perform the task of the Japan Nuclear Energy Safety Organization (JNES), the government shall disband JNES as soon as possible and shall take the necessary legal measures, including allowing JNES personnel to become Nuclear Regulation Agency personnel." Based on this stipulation, the law disbanding JNES was passed in November 2013 and JNES was merged into the NRA in March 2014. As a result, the number of officials of the Nuclear Regulation Agency doubled from 545 to 1025.

## Conclusion

Based on the analysis of regulatory reform of food safety and nuclear safety in Japan, comparative analysis is undertaken at the conclusion.

One major difference between food safety regulation and nuclear safety regulation in Japan after reform is the organizational division of labor between risk assessment and risk management (Shiroyama 2016a). In case of food safety regulation, the FSC at the Cabinet Office is in charge of risk assessment, while the MHLW and the MAFF

oversee risk management. In cases like this, the FSC can confine itself to assessing risk on the basis of scientific knowledge, even though risk management agencies try to delegate substantial decisions and avoid blames in reality. In case of nuclear safety, the NRA at the Ministry of Environment has a dual mission of risk assessment and risk management. The NRA has a special difficulty because it is responsible for both assessing and managing risk. It must make science-based decisions, but science alone is not enough since social decision-making is also involved. It will be important for the NRA, as an entity making social decisions, to establish effective communication with various social actors and earn the public's trust as an independent regulatory body.

There are also common aspects. In both cases, accidents such as BSE and nuclear accident function are drivers for change and bipartisan consensus at politician's level existed for reforming the safety regulatory regimes. But there remain common issues for capacity development. One challenge is recruiting and training capable human resources, fulltime or part-time bases, to give the FSC or NRA sufficient capabilities to ensure its independence. In addition to the expertise in specialized areas, the ability to communicate across disciplines is also vital in regulatory setting. In that sense, it is important for Japan to create a career path for regulatory science and crisis management not limited to food or nuclear safety.

# Risks and Compliance: Brazil

James Batista Vieira
Department of Public Management, Federal University of Paraíba – UFPB, João Pessoa, Paraíba, Brazil

## Synonyms

Better public governance; Promoting integrity; Risk management

## Definition

The management of risks and compliance is a tool for better governance, oriented toward creating and preserving value in both public and private organizations.

Since 2016, the Brazilian central government has been taking initiatives on governance, risks, and compliance (GRC). The approval of the Public Enterprises Law (Law n° 13.303/2016) and the Governance Decree (Executive Order 9.203/2017), besides a periodic evaluation of the public

governance quality made by the Federal General Accounting Office (TCU), officially started a boom on GRC management all over national public agencies. This movement of public governance improvement tends to grow fast as more value is required from governmental expenditure in public policies (performance), and the adoption of new effective anticorruption measures and integrity advancements (compliance) seems to be a permanent demand of Brazilian citizenry after the *Car Wash* corruption scandal.

After a long period of inertia, public administration has finally begun to promote the adoption of better performance and conformity measures to answer people's claim for more value and integrity in the public sector. However, this is not free of challenges, such as the huge lack of expertise, governability threats, and a wide-spread culture of patrimonialism operating inside the Brazilian Public Administration agencies.

## Governance, Risk, and Compliance Development in the Brazilian Democratic Regime

The Brazilian Federal Constitution of 1988 inaugurated the wider democratic period of the country since its independence. However, it also represented a significant throwback in public administration reform and modernization. With Brazil's presidential system of government and fragmented multiparty system, governability rapidly became a serious political issue to the new democratic elected public office holders. Since the democratization, two of four elected presidents were impeached (Fernando Collor and Dilma Roussef). The other two, Fernando Henrique and Lula da Silva, strictly observed the informal rules of a coalitional presidentialism that prevails in Brazil since the Constitution of 1988 and imposes a great challenge to public administration's well-functioning (Abranches 1988, 2018).

In the absence of a political reform to enhance governability, Presidents, Governors, and Mayors sacrificed public management good governance and adopted large political coalitions based on patronage in order to obtain and sustain power in a manner well-known in Brazil's public administration history (Faoro 1958; Andrews and Bariani 2009). Within this true spoil system, Brazilian legislators and their parties have been exchanging their political support for economic support and other forms of personal assistance mainly achieved by the occupation of cabinet portfolios or other executive positions (Power and Taylor 2011). Under this clientelistic logic of management, accountability mechanisms are weakened, performance instruments are unnecessary, and integrity orientation is largely perceived as a political naivety.

In 1995, the Bresser-Pereira's managerial attempt of state reform, during the beginning of Fernando Henrique's government, failed in almost all aspects, due to strong corporatist resistance of public employees and the political clientelistic pressures made by legislators and parties that could lose power. After a wide range diagnosis about the operation of the Brazilian Public Administration, Bresser-Pereira sponsored a strengthening of the public agencies' governance. Although the proposed plan had not made an open defense of risk management or compliance, its content explicitly advocated in favor of a performance-based approach of public management that would perfect direction and control of the governmental machinery and foster a cultural reform that would emphasize trust in public agents (MARE 1995). Such failure delayed not only the adoption of new governance mechanisms, like risk management and compliance, but harmed all Brazilian Public Administration modernization for over 20 years.

Until 2016, some initiatives were taken for promoting risk management and compliance in Brazilian Public Administration. Initial steps were taken by the federal government with the approval of the Ethics Code of the Public Employee in 1994, the creation of the Ethical Management System in 2007, and the approval of the Conflict of Interest Law in 2013. The first regulation applied only to federal public administration entities, established deontological ethical principles and prohibitions imposed on public employees, and regulated the creation of ethical committees. The second regulation integrated actions, programs, and entities related to

ethical promotion and established the process of verification of ethical misconducts. In practice, this system had little impact for preventing or punishing administrative abuses. Moreover, its merely formal implementation only helped introduce ethical awareness into the public entities. Finally, the Conflict of Interest Law is being implemented, but its preventive spirit has also showed little impact for preventing abuses. Therefore, nothing similar to a compliance system appeared until the enactment of new regulations in 2016.

Similarly, risk management was not seriously considered by Brazilian public agencies until the mid-2000s. First attempts of risk management taken by the Brazilian Central Bank began in the 1990s, linked to the actions of investment of international reserves. However, it was only after 2000 that a proper strategic asset allocation and risk management structure was created in that agency. International regulations, like the Basel II Accord, that intended to establish risk and capital management requirements to ensure that a bank had adequate capital for the risk it exposes itself to through lending, investment, and trading activities led the Central Bank to deepen those initiatives, not just to systematically monitor financial risks but to consider operational risks. The Central Bank's semi-independent status supported those efforts and allowed them to flourish, especially after the creation of the Department for Integrated Risk Management of the Monetary Policy Area in 2006 (GEPOM/BCB).

The Ministry of Social Security also played an important role in the initial development of Brazilian risk management. In 2004, the ministry started to incorporate those practices into the entity's culture and process management. Based on AS/NZS 4.340/2004 standards, a document titled "conceptual model for risk management" was produced and disseminated into the ministry. In the year 2014, the ministry launched its own policy and methodology of risk management, emphasizing the macro processes of strategy and purchase (*Portaria* MPS 534/2014). Since then, risk management has been considered an important tool of innovation and institutional development to the ministry, systematically taking part in its planning.

Lastly, in 2013, the Ministry of Finance and the Ministry of Planning launched their own risk management programs. The Ministry of Finance's initiative was related to a broader program of modernization which was trying to promote advancements on internal controls. Ministry of Planning's one was taken in 2013 with the approval of the Orientation Guide for Risk Management. This introductory document was an attempt to support risk management development inside the ongoing public management program of excellence, called GESPUBLICA. Alongside United Kingdom's Foreign and Commonwealth Office, that orientation guide incorporated many elements of the British Orange Book, but its effectiveness proved to be insufficient with time (HMT 2004; MPOG 2013).

Constrained by a poor governance structure, dominated by patronage relationships, and a strong lack of accountability and transparency, risk management and compliance mechanisms were underdeveloped within the Brazilian Public Administration. Practices of constant abuse of public office for personal gain proved not to be suitable with the adoption of professional management in the public administration entities. As a result of a huge political pressure caused by *Car Wash*, associated with mass protests against corruption like those that took place from 2013 to 2015 – demanding a new governmental attitude in favor of a better public governance and effectiveness to public services – GRC started to be gradually introduced into the governmental agenda.

## Current Advancements in the Brazilian GRC

The recent advancements about governance, risks, and compliance in the Brazilian Public Administration can be understood through three cumulative stages of development. The first one began just after the political crisis of 2013 and embraced international practices against corruption with a particular focus on strengthening private corporation integrity. The second, in 2016, tried to address the negative impact of PETROBRAS and other state-owned enterprises' crisis, improving their

corporative governance. Finally, the third, after 2017, clearly recognized the importance of better public governance mechanisms, like risk management and compliance systems, straight into Public Administration entities.

In 2013, the first governmental attempt to address these political and managerial crises was materialized by the Anticorruption Act (Law 12.846/2013). Like other international norms, such as the FCPA and UK Bribery Act, the Brazilian Anticorruption Act fixed an objective liability for companies involved in acts of corruption and imposed heavy sanctions in both civil and administrative spheres. In order to promote preventive measures against these practices, the Anticorruption Act also encourages the adoption of compliance systems by the companies, creating a momentary interest about this issue in Brazilian companies. At the initial reform period, the general reaction against public service ineffectiveness and corruption focused on the private corruptor agent, not on GRC improvement in governmental bodies.

In 2016, the second stage of reforms began with the approval of the new State-Owned Enterprises Act (Law 13.303/2016). The Brazilian Constitution establishes that the economic intervention of the government in the economy has an exceptional character (Article 173) and should serve national security purposes or relevant collective interests. However, numerous state-owned companies, at the federal, regional, or local level, provide public services in key areas of the economy – like communication, banks, oil, gas, water and energy supply, public transportation, etc. Even after an important period of liberalization, occurred during the 1990s, these public enterprises play an incredible role in national economic investment and growth, managing a massive budget, even greater than most of the ordinary Brazilian ministries. Since its creation, the directive board of these state-owned companies has been politically appointed and divided between the governing parties in a well-known spoil system. This lack of corporative governance opened doors for all kinds of misuse, fraud, and corruption, exactly as revealed during *Car Wash*. In order to mitigate some of these risks, the new State-owned Enterprises Act seeks to improve the corporate governance structures of those state-owned companies, by developing a new legal and corporative structure, promoting professional management and improving the purchase process. Observing the OCDE guidelines, the Brazilian State-Owned Enterprises Act established mechanisms to enhance performance and integrity, also aiming to contribute to greater economic efficiency (OCDE 2015).

The State-Owned Enterprises Act consists of two blocks: the first set new corporate governance mechanisms (Title I) and the second fixed new purchasing procedures (Title II). It is possible to highlight three relevant aspects of the new law. The first is an attempt to ensure the independence and professionalization of the Board of Directors, Audit Committee, and State Administration. The law regulates the criteria for appointment (Article 17), the creation of the statutory committee to evaluate the conformity of the process of nomination of directors (Article 10), the responsibilities of the Board of Directors regarding risk management (Article 18), the publication of the board's remuneration (Article 12, I), the annual and individual performance evaluation of managers and members of committees (Article 13, III), the term of office (Article 13, VI), and the commitment to specific goals and results to be achieved by the Administration (Article 23). The second is the establishment of minimum transparency requirements that create an obligation to (i) publish an annual letter of governance that links the planning and performance of state-owned enterprises to their public purpose; (ii) adapt the social status to the legislative authorization of its creation; (iii) disseminate information on risk factors, performance, financial and operational data, governance policies, and the integrated report; and (iv) publish the policies of information disclosure, distribution of dividends, and related party transactions (Article 8). The third is the implementation of an effective compliance system that strengthens the companies' internal risk management and internal control structures (Article 9). In addition, the Law required the adoption of rules and structures for risk management and internal control (Article 9), the approval of a Code of Conduct and Integrity (Article 9, §1), the binding of the responsible body to the CEO (Article

9, §2), and the creation of a statutory audit committee as an auxiliary body of the Board of Directors (Articles 24 and 25).

The third stage of reforms started in 2017 when the Presidency of the Republic enacted an executive order, called decree of governance (Decree 9.203/2017), setting the policy of public governance for all the public agencies that integrate the federal executive branch of government. This act originated from the recommendations set forth in judgment 1.273/205, made by the Brazilian Federal General Accounting Office, equivalent to the General Accounting Office of the United States. The recommendation (TC 020.830/2014-9) suggested to the Presidency of the Republic to develop a long-term plan to strengthen governance in the public agencies (TCU 2014). The decree of governance defines the main concepts and establishes principles, guidelines, and mechanisms for the exercise of public governance. The six principles to be observed by these public agencies are (i) the capacity to tackle public issues, (ii) integrity, (iii) reliability, (iv) regulatory improvement, (v) accountability, and (vii) transparency. It is inside this broad framework of governance, proposed by the Federal Court of Auditors, that risk management and compliance systems are currently evolving inside the Brazilian public administration. This act defines public governance as a set of leadership, strategy, and control mechanisms put in place to evaluate, direct, and monitor public management. The public governance is viewed as a way for conducting public policies and providing services of public interest, including risk management, as a permanent process established, directed, and monitored by senior management, which includes the activities of identifying, evaluating, and managing potential events that may affect the organization, in order to provide reasonable assurance about achieving its objectives.

Under this general framework of public governance improvement, risk management has been promoted as a tool that ensures the identification, evaluation, treatment, monitoring, and critical analysis of risks that may impact the implementation of the strategy and the achievement of the public agencies' objectives. According to the decree of governance (Article 17), four principles should guide the risk management implementation process: (i) application of risk management procedures in a systematic, structured, timely, and documented manner, subordinated to the public interest; (ii) integration of risk management into the strategic planning process and its developments, activities, work processes, and projects at all levels of the organization relevant to the execution of the strategy and the achievement of the institutional objectives; (iii) establishment of internal controls proportional to the risks, in order to consider their causes, sources, consequences, and impacts, observing the cost-benefit ratio; and (iv) use of risk management results to support continuous improvement of risk management, control and governance performance and processes.

Alike, as a way of promoting better governance, public agencies are also expected to implement compliance systems to prevent bribe, frauds, and conflict of interests and promote integrity behavior. This so-called integrity system should promote the adoption of actions and other institutional measures aimed at the prevention, detection, punishment, and remediation of fraud and acts of corruption (Article 19). It means that each public agency is obliged to create a unit responsible for implementing the compliance system. In addition, it is expected the top management's commitment and support; a periodical analysis, evaluation, and management of risks related to integrity; and continuous monitoring and improvement of integrity program attributes.

Since the decree's enactment, many public agencies have approved their own policies and plans to advance risk management and compliance systems. The Brazilian Federal General Accounting Office (TCU) and the General-Comptroller Office (CGU) have published guidelines to disseminate better practices and raise public agents' awareness about the importance of these tools for public governance (TCU 2018a, b; CGU 2018a, b, c). The implementation strategy tries to respect the diversity of the public agencies' nature, objectives, and institutional purposes, offering them a general framework within well-established procedures, based on international standards like COSO and ISO. After a short period of vacancy,

these mandatory initiatives will be periodically audited by TCU and CGU, allowing them to sanction the public agencies and their agents, if the practices are not being properly implemented. This process is expected to start in 2019 (Vieira and Tavares 2019).

The effective adoption of GRC measures, like risk management and compliance systems, is an important ally for overcoming the culture and practice of traditional Brazilian public administration patronage. In order to pursue the public value's creation and preservation, these tolls can be applied to develop a more democratic, transparent, accountable, and effective public administration in Brazil. However, while the basics of GRC may seem simple, these techniques are still quite challenging to implement because of the national political and managerial context.

## Synonyms

Internal Water Law; International Watercourse; River; River Basin; River Governance; Water Governance

## Introduction

Rivers were the center of human civilizations and have always been a crucial and precious natural resource for human survival and development. River basins cover almost half of the earth's surface and are sources of around 60% of world's freshwater flows. Rivers are also home to 40% of the world's population. Currently, there are 276 transboundary lakes and rivers worldwide, although

only 40% of them are governed by agreements. Where agreements exist, 80% involve only two countries, although there are other states which may also be part of the river or watercourse in question ("UN Watercourses Convention Online User's Guide-United Nations Watercourses Convention Enters into Force"). Rivers do not regard political boundaries, and therefore whenever a river crosses political boundaries of states, the question of utilization and management of the river becomes crucial (Varma 2013). Although there is a growing trend among the nations to reach and develop cooperative frameworks for the utilization and management of rivers, challenges still remain due to the conflicting interests of the upstream and downstream states in their respective claims over a shared river. Growing water scarcity is a challenge for the states and their governments who have the responsibility to devise effective and innovative solutions to the problem. At the Second World Water Forum, the Global Water Partnership (GWP), an international network involved in water resources management, presented a document titled *Towards Water Security: A Framework for Action* where it was observed that *the water crisis is mainly a crisis of governance* (Gunawansa et al. 2013). Since most of the rivers in the world are international in character and management of these rivers depends on the mutual cooperation among the states and their governance structure, law specifically international law may act as an effective tool in enhancing a sound management and effective governance of rivers. The next section provides definitions of some terms used in this entry for a better understanding of the issue of river law and governance.

## Definition

This entry makes reference to some technical and legal terms relevant to river law and governance which have been defined as follows:

### International Rivers, International Watercourses, and Transboundary Rivers

Rivers may be classified into "national rivers" which are fully located within the territory of a state and "international river" which flow through several states and may separate two different states or successively cut across two or more states (Aguilar and Iza 2011). In this entry, the terms "international rivers," "international watercourses," "transboundary rivers," "shared rivers," and "shared water resources" will be used interchangeably. "International rivers" also known as "transboundary rivers" is one either flowing through the territory of two or more states (known as "successive river") or one separating the territory of two states from each other (known as "contiguous river"). The term "international river" has evolved over the years and has given prominence to a more appropriate and inclusive term "international watercourse" (Salman and Uprety 2003).

Article 2(a) of the 1997 UN Watercourses Convention states, "*Watercourse means a system of surface waters and groundwaters constituting by virtue of their physical relationship a unitary whole and normally flowing into a common terminus*." Article 2(b) of the Convention defines "international watercourse" as a "*watercourse, parts of which are situated in different States*."

### River Basin

The expression "river basin" refers to the "area of land drained by a river and its branches, or tributaries" (Teclaff 1996).

### River Governance/Water Governance

In this entry, "river governance" and "water governance" have been used interchangeably, although "water governance" is a broader term than "river governance" since it includes all categories of water resources. The Global Water Partnership (GWP) defines "water governance" as "*a range of political, social, economic, and administrative systems, set out to develop and manage water resources and water supply at different levels of society.*" (Rogers and Hall 2003)

### International Water Law

The set of rules and principles of international law that governs the utilization, management, and protection of international rivers or watercourses is termed as "international water law" in the current legal literature.

## River Law and Governance

Governance of rivers has both national and international dimensions since most of the rivers are international and transboundary in character. Most states recognize integrated water management as an effective tool for improving water management and distribution, and within the domain of this approach, the concept of governance is defined by international law. River governance is operationalized by international law through the codification of principles and rights and duties of states regarding the management, utilization, and protection of shared water resources. International law, specifically international water law, acts as a vehicle for good governance and management of shared rivers. Therefore, the agreements concluded by the states for the governance and management of rivers should be properly implemented, and states should act to enhance their mutual cooperation and joint benefits through coordination of their laws, policies, and institutions. It should also be borne in mind that states are not the only actors or beneficiaries in the process of river governance. People are the real and direct stakeholders in the process, and their access to water should be guaranteed (Aguilar and Iza 2011).

Water governance was regarded as the most important issue in the 2001 Bonn Freshwater Conference, and it was proposed that *each country should have in place applicable arrangements for the governance of water affairs at all levels*. Undoubtedly, regulation and management of shared rivers or watercourses are part of international law. However, the portion of the river located within the national jurisdiction of a state is regulated by the national law of that particular state. Therefore, international water law and national water law cannot remain in isolation since they influence each other through both national and global standards. The development and codification of international water law were based on state practice, and national water law is one of the indicators of such practice. Again, international water law instruments created the parameters for the formulation of national water laws. Example may be given of the European Union where the member states have the obligation to make necessary changes to their national legislation to bring it into conformity with the European Community Directives and the European Union Water Framework Directive. States are also required to develop coordination mechanism for the integrated management of shared water resources (Aguilar and Iza 2011).

Effective water governance at the national level may lead to the effective governance of shared rivers at the international level. Due to the transboundary character of rivers, activities in one country may have an impact on the use of that river by other countries. Where the major portion of a country's territory is located within a shared river basin, the national water policy of the country should take into consideration such geographical circumstance and international commitments to other states sharing the river. Therefore, international and national law coexists and influences each other on the question of management of shared rivers. This may also be true for waters that are not shared or do not go beyond political boundaries of states since water may also move beyond boundaries without actually crossing the same through hydrological cycle (Aguilar and Iza 2011).

A complete understanding on the interaction between river law and governance requires some degree of elaboration on certain factors such as what international legal instruments govern international rivers, who are the important actors in river governance, what are the substantive governing norms as regards management and utilization of rivers, what procedure is to be followed in observance of such norms, and finally what kind of institutional mechanism has been offered by international law and how river disputes may be resolved. The following subsections provide an account of these crucial components for river governance.

### Existing International Legal Instruments for the Governance of Rivers

The international law instruments that made significant contribution toward the development of law relating to non-navigational uses of international rivers include the following:

### The 1992 Convention on the Protection and Use of Transboundary Watercourses and International Lakes (UNECE Convention)

The Convention on the Protection and Use of Transboundary Watercourses and International Lakes was adopted on 17 March 1992 and entered into force on 6 October 1996. At the time of adoption, the Convention was only open to member states of the United Nations Economic Commission for Europe (UNECE). However, in November 2003, the Convention was amended to allow all UN member states to become parties to the Convention. The amendment entered into force in February 2013. The Convention has two protocols, the 1999 Protocol on Water and Health and the 2003 Protocol on Civil Liability. The Convention has provided a comprehensive framework for transboundary water cooperation across the UNECE region.

### The 1997 UN Convention on the Law of Non-navigational Uses of International Watercourses (UN Watercourses Convention)

The Finnish delegation at the UN proposed an agenda titled *Progressive development and codification of the rules of international law relating to international watercourses* to be included in the agenda of the UN General Assembly meeting of 1970. In accordance with the Finnish proposal, the General Assembly adopted Resolution 2669, entrusting the International Law Commission (ILC) with the task of initiating a study on the law of non-navigational uses of international watercourses. The work of ILC took almost three decades and finally led to the adoption of the Convention on the Law of the Non-navigational Uses of International Watercourses on 21 May 1997. The Convention came into force in August 2014 (Chazournes 2009). The Convention holds special significance from governance perspective since it introduces a single set of criteria to be observed by all countries within international river basins. These criteria determine the issues that countries should discuss on the management, utilization, and protection of their shared rivers, thereby facilitating transboundary river cooperation and accountability of governments to their own countries and regions ("UN Watercourses Convention Online User's Guide-United Nations Watercourses Convention Enters into Force").

### Other Regional/Multilateral Legal Instruments

Other legal instruments of limited geographical scope include:

- The Amazon Cooperation Treaty, 1978
- The 2000 Protocol on Shared Watercourse Systems in the Southern African Development Community (SADC)
- The Directive 2000/60/EC of the European Parliament and Council, establishing a community framework for action in the field of water policies
- The 1995 Agreement on the Cooperation for the Sustainable Development of the Mekong River Basin
- The 1999 Convention on the Protection of the Rhine
- The 1994 Convention on Cooperation for the Protection and Sustainable Use of the Danube

## Actors in River Governance

River governance is a complex process involving multiple levels of actors including national governments, civil society, river basin organizations, intergovernmental organizations, dispute settlement bodies, international financial institutions, nongovernmental organizations, and individuals. Any discussion on river governance is incomplete without an account of these actors. National governments influence river governance through domestic policies and activities and also through their interaction with other states. Different bodies of the UN have been mandated to conduct activities regarding international watercourses. These UN bodies and specialized agencies include the UN-Water, UNDP, UNESCO, UNEP, the Water Supply and Sanitation Collaborative Council, FAO and WHO, etc. World Bank and other development banks finance projects dealing directly or indirectly with international watercourses. One of the five areas of focus of the Global Environmental Facility (GEF), established in 1994 as an independent institution, includes "international waters."

GEF finances projects involving 33 river basins and facilitates joint management of surface and groundwater basins as well as coastal and marine waters. Other organizations or institutions having specific functions on the issue of water governance include the International Network of Water Basins (INBO), the Global Water Partnership (GWP), the World Water Council, and the International Union for the Conservation of Nature (IUCN). These institutions and organizations serve to promote interaction between organizations involved in river basin management, capacity building, knowledge sharing, public awareness, and promotion of efficient management and utilization of water resources. Apart from these organizations and institutions, reference should also be made about the contribution of some international and national NGOs working on the legal and policy aspects of watercourse-related issues. The World Wildlife Fund (WWF) is an example of such an international NGO (INGO) whose active engagement promoted the ratification of the UN Watercourses Convention and facilitated the entry into force of the Convention. Adjudicative bodies like the International Court of Justice and other arbitral tribunals established under watercourse agreements are also important actors in river governance since they play a pivotal role in the process through the interpretation of international water law norms and principles and settlement of watercourse disputes (UNEP 2015).

## Substantive Governing Norms of River Governance

Management and governance of international rivers involve legal, scientific, and policy issues, and international water law acts as a platform for integration of these issues. It also lays down the rights and duties of states in the management of shared rivers and the procedure for the implementation of the same. There are about 400 agreements governing international cooperation on transboundary rivers. However, the current discussion will make a number of references from the provisions of the 1997 UN Watercourses Convention and the 1992 UNECE Convention since these two instruments are considered as global legal regime on the regulation of international rivers (Wouters 2013).

### Equitable and Reasonable Utilization

Major international water law instruments recognize the substantive right of states to "equitable and reasonable use" of shared water resources. A state is entitled to an equitable and reasonable share of the uses and benefits of its watercourse, although there is a reciprocal obligation on the part of that state to refrain from depriving other states of their respective rights to the watercourse in question. Equitable utilization is based on the principle of sovereign utilization of the watercourse which confers on the state a right to the utilization of the watercourse which is qualitatively equal to the rights of other states. Reasonable utilization implies the concept of rationality and takes factors such as the socioeconomic development of a state into consideration ("Equitable and Reasonable Utilisation: UN Watercourses Convention User's Guide").

Article 5(1) of the UN Watercourses Convention affirms, "*Watercourse States shall in their respective territories utilize an international watercourse in an equitable and reasonable manner.*" Article 6 of the Convention sets forth a non-exhaustive list of social, environmental, economic, and hydrographic factors to be considered when evaluating equitable and reasonable use. It is important to note that Article 10 of the Convention gives priority to "vital human needs" over other uses of a river. Article 2 of the UNECE Convention also requires states "*to ensure that transboundary waters are used in a reasonable and equitable way, taking into particular account their transboundary character, in the case of activities which cause or are likely to cause transboundary impact*."

### No Significant Harm

Another key substantive rule contained in the UN Watercourses Convention includes the "duty not to cause significant harm to other states sharing the watercourse." Article 7 of the Convention requires the states to take all appropriate measures to prevent the causing of significant harm to other states sharing the watercourse. The Convention

does not impose an absolute prohibition on causing harm and recognizes the probability that such harm may occur even during the equitable utilization of the watercourse in question. However, it provides that when such harm does occur, the states causing the harm shall take all appropriate measures, in consultation with the affected state, to eliminate or mitigate such harm and discuss the question of compensation.

Article 2 of the 1992 UNECE Convention states, "*the Parties shall take all appropriate measures to prevent, control and reduce any transboundary impact*." The Convention defines "transboundary impact" as "*any significant adverse effect on the environment resulting from a change in the conditions of transboundary waters caused by a human activity, the physical origin of which is situated wholly or in part within an area under the jurisdiction of a Party, within an area under the jurisdiction of another Party*" [Article 1(2)].

### Duty to Cooperate

Cooperation is a key to promote efficient governance of shared rivers. It is a principle which may facilitate states to reach consensus on the utilization and management of rivers. International water law treats cooperation among states as a duty and requires states to manage their shared rivers in a cooperative manner. Article 8(1) of the 1997 UN Watercourses Convention states, "*Watercourse States shall cooperate on the basis of sovereign equality, territorial integrity, mutual benefit, and good faith in order to attain optimal utilization and adequate protection of an international watercourse*" (Schulz 2007). Although there are multiple challenges to the governance of transboundary rivers, in most cases states have chosen the path of cooperation rather than conflict. This is also supported by the Transboundary Freshwater Dispute Database (TFDD) prepared by the Oregon State University, according to which among more than 1,800 events of conflict or cooperation over shared water resources occurring since 1948, most of the events represent instances of cooperation (Gerlak and Schmeier 2013). Cooperation is made practical through some procedural rules of international water law which include the creation of river basin organizations, information exchange, notification, consultation, etc. In observance of the duty to cooperate, states may adopt various combinations of these mechanisms (Schulz 2007).

### Protection and Sustainable Management of Rivers

Both the UN Watercourses Convention and the UNECE Convention recognize the need and importance of the protection, preservation, and sustainable management of shared watercourses and their ecosystems. The obligation of states to protect the ecosystems of watercourses has been laid down in Article 20 of the UN Watercourses Convention which states, "*watercourse States shall, individually and, where appropriate, jointly, protect and preserve the ecosystems of international watercourses*." Articles 21, 22, and 23 of the Convention further elaborate this obligation to include prevention, reduction, and control of pollution, prevention of the introduction of alien species, and protection and preservation of the marine environment. Article 2 of the UNECE Convention also adds emphasis on the conservation and restoration of watercourse ecosystem.

The concept of sustainable development embodies the objective or consideration which guides management and conservation of resources. Article 5(1) of the 1997 UN Watercourses Convention states, "*an international watercourse shall be used and developed by watercourse States with a view to attaining optimal and sustainable utilization thereof and benefits therefrom, taking into account the interests of the watercourse States concerned, consistent with adequate protection of the watercourse*." Again Article 24 of the same Convention, while defining "management of international watercourse," states that "management" refers *to* "*planning the sustainable development of an international watercourse and providing for the implementation of any plans adopted*" and "*promoting the rational and optimal utilization, protection and control of the watercourse*." Article 2(5)(c) of the 1992 UNECE Convention requires that, "*Water resources shall be managed so that the needs of the present generation are met without compromising the ability of future generations to*

*meet their own needs*." Article 2 further requires states to take all appropriate measures to ensure the conservation of transboundary waters. Again Article 3(1)(i) of the Convention requires parties to promote sustainable water resources management. Thus sustainable management is considered as an evolving element in the governance of shared rivers and water resources (Birnie et al. 2009).

## Procedural Norms of River Governance

Procedural norms of river governance are instrumental toward implementation of the substantive norms. Both the 1997 UN Watercourses Convention and the 1992 UNECE Convention provide for procedural duties of states before initiation of projects or activities affecting the use of the shared river or watercourse.

### Notification, Consultation, Negotiation, and Exchange of Information

Articles 11–19 of the UN Watercourses Convention provide detailed rules on notification, consultation, and negotiations regarding planned measures adopted by a state which might have a significant adverse effect on other states sharing the river. Article 11 is a general provision which embraces the process of notification, consultation, and negotiation concerning planned measures. Article 11 states, "*watercourse States shall exchange information and consult each other and, if necessary, negotiate on the possible effects of planned measures on the condition of an international watercourse*." Article 12 provides the rule concerning notification, the time of making notification, and the information to be included with the notification. According to Article 12, such notification has to be made before the state implements or permits the implementation of planned measures which may have a significant adverse effect upon other states. Such notification shall be accompanied by available technical data and information, environmental impact assessments, in order to enable the notified states to evaluate the possible effects of the planned measures. Articles 13–16 lay down the provisions for period of reply to notification and subsequent procedure thereof.

Article 17 of the Convention provides for consultation and negotiation concerning planned measures. Article 17 requires that if a communication is made against the implementation of the planned measures, the notifying state and the state making the communication shall enter into consultations and, if necessary, negotiations with a view to arriving at an equitable solution of the situation. During the course of the consultations and negotiations, the notifying state shall, if so requested by the notified state at the time it makes the communication, refrain from implementing or permitting the implementation of the planned measures for a period of six months unless otherwise agreed. The obligation to refrain from the implementation of measures can be relaxed in urgent situations when the measure is necessary to protect public health and safety. The UNECE Convention also requires the state parties to observe similar categories of procedural obligations.

Exchange of data and information is crucial for the equitable utilization of the watercourse in question and also for the prevention of significant harm since without proper information it will be difficult for a state to regulate uses and to ensure protection of the watercourse. Article 9 of the UN Watercourses Convention which deals with regular exchange of data and information concerning the shared watercourses provides that states sharing a watercourse shall on a regular basis exchange readily available data and information on the condition of the watercourse, in particular that of a hydrological, meteorological, hydrogeological, and ecological nature and related to the water quality as well as related forecasts. If a state is requested by another state to provide data or information that is not readily available, it shall employ its best efforts to comply with the request but may condition its compliance upon payment by the requesting state of the reasonable costs of collecting and processing such data or information. Article 9 of the UNECE Convention requires state parties to enter into bilateral/multilateral agreements to establish joint bodies for the purpose of exchange of information on existing and planned uses of water and related installations that are likely to cause

transboundary impacts. It also requires states to participate in the environmental impact assessment processes relating to transboundary waters.

### Public Participation

Participation is considered as a key to successful environmental decision-making, environmental justice, and good governance. Effective river governance entails the participation of all relevant stakeholders. The UNECE Convention and its Protocol on Water and Health contain rights on public information and participation. Article 5(i) of the Protocol provides "*access to information and public participation in decision-making concerning water and health are needed, inter alia, in order to enhance the quality and the implementation of the decisions, to build public awareness of issues, to give the public the opportunity to express its concerns and to enable public authorities to take due account of such concerns*." Article 9(1) requires the parties to "*enhance the awareness of all sectors of the public regarding the importance of … water management and public health (and) the rights and entitlements to water and corresponding obligations*." Under Articles 11–14, the public is also endowed with the right of being notified of and involved in international cooperation on transboundary waters and the development of commonly agreed targets and joint water management plans ("UNECE-Guide to Public Participation under the Protocol on Water and Health").

## Institutional Mechanism for River Governance

The institutional mechanism as contained in most of the watercourse agreements is particularly crucial for river governance. Interstate cooperation in the management of rivers is achieved through the establishment of joint commissions and institutions. These institutions serve as a platform for effective management of transboundary rivers as well as for reconciliation of competing interests of the states in their shared waters. Such institutions or organizations [sometimes also referred to as the "River Basin Organization" (RBO)] are created by agreements between the states (Aguilar and Iza 2011). The creation of joint institutions or RBOs leads to the concretization of the obligation of cooperation and equitable and reasonable utilization. Article 8(2) of the UN Watercourses Convention states, "*in determining the manner of such cooperation, watercourse states may consider the establishment of joint mechanisms or commissions, as deemed necessary by them, to facilitate cooperation on relevant measures and procedures in the light of experience gained through cooperation in existing joint mechanisms and commissions in various regions*." Article 24 of the UN Watercourses Convention states, "*Watercourse States shall, at the request of any of them, enter into consultations concerning the management of an international watercourse, which may include the establishment of a joint management mechanism*."

The UNECE Convention also requires the creation of river basin organizations. Under the Convention, the Meeting of the Parties (MOP) and its subsidiary bodies have been entrusted with the implementation of the agreement. Almost all the recent watercourse agreements have established joint institutions with a variety of structures and functions. Instances of such organizations include the Niger Basin Authority, the Mekong River Commission, the Permanent Indus Commission, the International Commission for the Protection of the Rhine, the International Commission for the Protection of the Danube, etc. (Schulz 2007). It is pertinent to note that a national institution responsible for the management of a shared river within its territory can influence the decisions of and coexist with an institution or supranational body that has authority and jurisdiction over the entire river basin (Aguilar and Iza 2011).

## Settlement of Disputes

An effective dispute settlement mechanism enhances the efficiency of the legal arrangements governing the management of shared rivers. Settlement of disputes concerning international watercourses can be achieved through two mechanisms. First, the disputes may be resolved through private remedies sought from the courts and tribunals. Such mechanism is more effective and expeditious and therefore more convenient for the injured party. It is also very appropriate where the dispute arises between two parties from

different sides of the international boundary. Second, in some cases watercourse disputes may be resolved through the assistance of some expert bodies. Joint institutions/commissions as discussed in the previous section may be empowered with the authority and competence to resolve disputes or to recommend solutions to the states involved in the dispute (McCaffrey 2007).

Article 33 of the UN Watercourses Convention proposes a voluntary mechanism for settlement of interstate disputes by peaceful means. Article 33(2) of the Convention provides, "*if the Parties concerned cannot reach agreement by negotiation requested by one of them, they may jointly seek the good offices of, or request mediation or conciliation by, a third party, or make use, as appropriate, of any joint watercourse institutions that may have been established by them or agree to submit the dispute to arbitration or to the International Court of Justice*."

Article 33(3) refers to a mechanism of "fact-finding" stating that if after six months from the time of the request for negotiations, the parties have not been able to settle their dispute through negotiation or by any other means referred above, it shall be submitted, at the request of any of the parties, to impartial fact-finding. Articles 33-(4)–33(9) provide the rules for creation, function, and operation of the Fact-finding Commission. Article 33(10) sets out an alternative method providing scope for referring the dispute to the International Court of Justice or to an Arbitral Tribunal for settlement.

Article 22 of the UNECE Convention lays down the method for settlement of disputes between the parties. According to Article 22, the parties are required to seek resolution of their disputes by negotiation or by any other means acceptable to them. Alternatively the parties may also refer their disputes to the International Court of Justice or to the arbitration.

## Conclusion

One of the greatest challenges that the international community is facing today is having adequate access to freshwater of sufficient quality and quantity to meet human need, to enhance social and economic progress, and to protect the environment and ecosystem. In order to deal with such ever-growing challenge, river governance structure needs to be developed in a flexible and efficient manner. This may be achieved through a continuous evolution and development of international legal norms and institutions which deal with this issue. As discussed, governance structure of international rivers or watercourses is subject to laws, principles, non-binding instruments, and guidelines. However, complexities remain in the legal framework for the regulation of rivers or watercourses. Most of the states are parties to more than one international water agreements, although some international rivers or watercourses are not governed by any agreements. Dual regulation also exists where a state becomes party to a river basin agreement and to another agreement regarding a sub-part of the same basin at the same time. Again, sometimes a state becomes party to agreements covering more than one river basin. In such situations, states become bound to comply with multiple norms and to reconcile between different obligations and to function with several river basin institutions. Unlike the other multilateral environmental legal regime, there is no institution like the Secretariat or the Conference of Parties (which are entrusted with the function of implementation of the treaty under the auspices of which they have been established) under the international watercourse agreements (with the exception of the 1992 UNECE Convention which has provision for Meeting of Parties and Secretariat). The presence of such institutions could facilitate good practices among the states and coordination among different regional and basin institutions. Consequently, the legal framework for the governance and regulation of shared rivers remain to be over-lapping and fragmented in character. Effective and efficient river governance therefore calls for coordination and cooperation among the diverse actors, participants and stakeholders concerned in the governance of shared freshwater resources (UNEP 2015).

# Role Abandonment in Emergency Response

Mark Landahl
Frederick County Sheriff's Office, Frederick Community College, Frederick, MD, USA

## Synonyms

Ability to report; Reporting for duty; Willingness to report

## Definition

The conventional belief that public safety employees will fail to report or remain on duty in extreme events.

## Introduction

Well before the landmark event of Hurricane Katrina, US Department of Homeland Security policy and planning guidance to all levels of government included the possibility that emergency responders may not report for duty or may abandon their posts during extreme events. The fact that emergency services and other critical government employees will report and remain on duty is a key underlying assumption to emergency plans. It is well documented among various government and other reports that approximately 17% of officers (240 of 1450) of the New Orleans Police Department (NOPD) failed to report or abandoned their posts following Hurricane Katrina (Kushma 2007). The significance of this fact to emergency planning assumptions is the subject of debate. Some argue this as evidence that governments need to plan for this eventuality, while others cite it as an anomaly resulting from unique organizational factors unlikely to be repeated.

The purpose of this article is to examine the issue of role abandonment in emergency response based upon the several academic lenses used to study aspects of the issue. The article first seeks to

define the phenomenon. Second, it examines the theoretical foundations and research methods used to study the issue across academic disciplines. Finally, the article examines research findings for application to government emergency planning.

## Defining Role Abandonment

Defining the phenomenon of responders remaining on or reporting for duty when called in terms of role abandonment assumes a sociological focus. The following section expands to explain other academic views. In sociology, the concept of role is based on a position an individual occupies in the social system and the associated behavioral expectations or norms (Merton 1957). In terms of government response personnel and other essential government employees in extreme events, the associated behavioral expectation is to report and remain on duty. In these terms, the Hurricane Katrina example clearly does not meet the behavioral expectations of the role of a police officer.

An individual occupies multiple social roles. In these often-overlapping roles (family, work, community, etc.), strain (Theory of Role Strain) can develop among competing demands to engage the obligations of multiple roles. This conception of social role is generally economic in nature in that participation in roles is limited by time, space, and human energy. A competing theory identifies that the accumulation of additional social roles does not necessarily result in conflict or negative outcomes. These theories did not develop in the study of the emergency period of extreme events, but inform the overall concept of social role.

A branch of sociology, disaster sociology, examines the concept of role through the phases of disaster (mitigation, preparedness, response, and recovery). Dynes (1987) describes that the difficulty in conceptualizing social roles within the context of disasters is that disasters themselves are ill-defined. The goal in this paper is not to engage all aspects of definitional challenges, but recognize the difficulties in which this problem is situated. Two volumes and many additional papers specifically examine definitions of emergencies, disasters, and catastrophes. While the works do not reach consensus, they generally agree that quantitative and qualitative differences exist in scale of severity among the types of events (Quarantelli 2008). The severity of the event places extreme resource requirements on individuals, organizations, and communities to cope with the consequences. It is generally accepted that the example of Hurricane Katrina constitutes something more than a disaster, perhaps a catastrophe.

## Theories and Research Methods for Examining the Issue

As described above, the potential problem of responders failing to report or remain on duty in extreme events is studied through multiple academic lenses. Early studies in disaster sociology examined aspects of the issue as introduced above and discussed further below. This line of research developed and continued through the 1980s. In the early 1990s, a new line of research developed in the public health and medical field using different underlying theories with conflicting results. These studies examine the willingness and ability of hospital personnel to report for duty. The following paragraphs discuss these two lines of research.

The public health and medical line of research grew out of a study during the Gulf War in the 1990s. While under the threat of scud missile attack potentially armed with weapons of mass destruction, researchers in Israel polled critical hospital staff on their ability and willingness to report to duty under varying conditions (Shapira et al. 1991). The study became the first in a still developing line of research examining the potential problem. Early studies lacked theoretical underpinnings and examined this as a practical problem in the context of the emergency period. Later studies developed under workplace safety models and eventually applied the extended parallel process model, couching the willingness to report for duty as a function of personal appraisal

of the threat and one's belief in their ability to successfully manage the situation. These studies are generally predictive in nature, posing respondents with scenarios that follow with questioning on their willingness and ability to report for duty. These studies of staff intentions show predicted abandonment rates far above those ever recorded in the response to actual disasters (Trainor and Barsky 2011). Most predicted abandonment rates from these studies are more than double the actual observed rate in the extreme example among police officers in Hurricane Katrina.

As explained above, early studies in the field of disaster sociology assume conflict and strain develop among multiple social role expectations in extreme events that lead to role abandonment. This early research focused on social roles defined by the primary group (family) that come into direct conflict with other social roles including work roles (emergency response) (Killian 1952). Killian (1952) identified that the primary group always takes priority leading to abandonment of the emergency response role.

In contrast to the public health line of research, studies in disaster sociology examine actual events to trace human behavior during the extreme events. Disaster sociology seeks to understand behavior in future events by studying actions in previous events. Dozens of subsequent empirical studies following the initial findings of Killian (1952) refute these early claims about role conflict and the primary group. On the individual level, these studies of behavior in the emergency period of disaster show role abandonment as a rare event, earning the moniker of a disaster myth. The behavioral studies led to advancement of the concept of role simplification in disaster. Researchers found that role strain is an aspect of daily life and disaster releases many normal role obligations. In addition, they argue that the enactment of roles is value based. In disaster, some role norms and values become more important and others become less important. In the emergency period, the response role becomes the most critical.

An example from a medical event illustrates the findings. Healthcare workers in Toronto, Canada, in 2003 faced an unfamiliar disease, with limited information about transmission, and expectation of high mortality rates in the early phases of the response to Severe Acute Respiratory Syndrome (SARS). Under these conditions, healthcare workers continued to report to work despite the unknown aspects of the disease, their colleagues falling ill and public concern about an epidemic (Booth and Stewart 2003). This example of behavior during an actual event is consistent with the findings of disaster sociologists across extreme events. Many expect that the novelty and unknown aspects of events, such as terrorist attacks, or biological material attacks, would result in differences in the human response. Studies that extended to these events show behavior patterns generally consistent with those found in studies of more common events, such as natural disasters.

Aspects of emergency response professions and common phenomena of disasters also aid in keeping responders on duty. Emergency responders self-select for professions and develop strong bonds within work groups, departments, and across regions that are hallmarks of the various response disciplines (such as law enforcement, firefighters, paramedics). Abandoning posts and leaving others to do the job are not norms in these professions. On the community scale, one of the truisms of disaster response is the concept of convergence. While in the initial response to disasters resources may be limited, in the aftermath personnel and material move toward or converge on, rather than move away from disaster locations (Fritz and Mathewson 1957). Convergence provides community resources from outside of affected areas to support operational and material needs. The personnel relief in the aftermath, often based on mutual aid provision by other departments, can allow local responders time off to attend to personal and familial needs without impacting operational capability.

Questions do remain about the impact of disaster scale. Some question whether research-derived knowledge of behaviors in disasters are directly applicable to larger-scale catastrophic events (Quarantelli 2008). Researchers continue to study this issue as a potential problem for

response despite few examples of behavioral manifestation in actual events. The topic remains of interest, particularly as it has not been completely disregarded as a potential outcome of extreme events. Work is still to be done on the full spectrum of conditions that could lead to abandonment of the emergency role. A helpful aspect of the public health research is the identification of potential areas of conflict and the preparedness actions that organizations can take to minimize strain.

## Conclusion: Application of Research Findings to Government Policy and Planning

Disaster myth or not, police officers failed to report and remain on duty in Hurricane Katrina. Although the rate was far below predicted rates from public health and medical studies, this number is also more than those shown in previous disasters revealed in studies by disaster sociologists. As such, it is not sufficiently explained by either line of research. Some advance that the scale of the event (disaster vs. catastrophe) resulted in unexpected abandonment by police officers. This argument is countered by the fact that similar abandonment rates were not noted in other response disciplines or organizations in the same discipline. This points to organizational issues within NOPD that fostered conditions for abandonment, including the failure to follow established preparedness protocols (Adams and Stewart 2015).

First response and other organizations with requirements for employees to report in extreme events need to engage several preparedness actions. Employees should be familiar with response roles based upon well-developed plans, policy, and regular specific training and exercises (Mileti 1985). Organizations should be prepared to openly and accurately communicate the situation and risks with employees. Emergency recall guidelines should clearly articulate expectations with established methods for communication. Organizations should also encourage individual employee and family preparedness. Preparedness plans for the organization should also include mechanisms for family communication and support during emergencies and relate the anticipated level of support in on-duty and off-duty statuses to personnel. Employees should also be properly equipped for emergency roles with an organizational focus on employee safety and health. While role abandonment by responders continues to be unlikely, but possible, these organizational actions can reduce the factors that may lead to strain and abandonment.

# Role of Bureaucracy in Public Policymaking in Ghana

Abdulai Kuyini Mohammed
Department of Political Science,
University of Ghana, Legon, Accra, Ghana

## Synonyms

Complementarity or conflict in politico-bureaucratic functions; Ghanaian civil service and public decision-making; Politics-administration dichotomy; Public administrators and public problem-solving

## Definition

Bureaucrats are public administrators who are appointed to work under the executive arm of the government. When a government takes a decision or chooses a course of action in order to solve a social problem and adopts a specific strategy for its planning and implementation, it is known as public policy (Anderson 2006). The precise contribution of public administrators to public policy development, implementation, and evaluation is a subject of controversy with some observers assigning them a more assertive and influential role, while others claim their contribution is minimal and less influential and subject to political control. This article interrogates these contending claims in Ghana to determine which view prevails and what the attendant consequences are.

## Introduction

In many countries today, the bureaucracy no longer commands the respect it once had due partly to a range of criticisms that have been directed against it, an attack that has led to radical public sector reforms commencing from the 1980s (Dunleavy et al. 2006). A suspicion of bureaucracy is clearly not novel as it long predates Weber (Albow 1970) and continues in many forms. What may distinguish the current onslaught, however, is that it comes from all sides: from the left, for example, on the power of the civil service to frustrate the will of elected governments, and from the right on the entrenched ideology of the state machine, its inefficiency, and above all its size (Gray and Jenkins 1985: 14).

In developing countries, criticisms of similar kinds have been directed at the bureaucracy, and these have been well documented (see Flynn 2002; Larbi 2003; Kenneth 2000). In Ghana, for example, the civil bureaucracy has been described as "a moribund, paper-pushing institution" (Nti 1978). Succeeding governments have often doubted the capacity of the civil service to implement policies and programs largely because of the perception that it lacked the commitment and political direction; it is over-bureaucratized, rigid, inflexible, and corrupt. For example, the first postindependence leader, Dr. Nkrumah, resolved that, "he would see to it that there were no 'civil masters' as under colonial rule but civil servants carrying out the policy decided by the cabinet" (Gyimah-Boadi and Rothchild 1990: 233). The two scholars assert that "senor officers were regarded with suspicion," which culminated in their loyalty being thrown into question. The Nkrumah's regime ensured that the bureaucracy was firmly brought under the control of the political executive (Ayee 2001). Similarly, Flt. Lt. Rawlings' Provisional National Defense Council (PNDC) military government blamed the civil service for not only sabotaging its policies and foot-dragging but also characterized the top echelon of the service as "allies of imperialism and neocolonialism which should be subjected to revolutionary overthrow and not mere reforms" (Republic of Ghana, 1982:0.5–6).

Moreover, since the ushering in of the new democratic dispensation in 1993, as a result of its unsatisfactory performance, the public service and public administrators have been severely lambasted by political leaders. They are seen as inefficient, incompetent, unresponsive, tunnel-hallucinated, secret, and isolationist. This attack of the public service has become an effective means to defend deep-seated pro-market reforms,

including downsizing the public sector and transforming the public service in the image of business enterprise, thus facilitating the expansion of political control over public administrators (Ayee 2013: 449).

Similar sentiments were expressed by the Advisory Group set up by the New Patriotic Party government in 2004 to guide the redesigned agenda of the Public Sector Reform program. The group identified the following weaknesses of the public service: ineffective leadership, weak management, lack of vision, low morale, excessive bureaucratic delays, low capacity for planning and implementation, pervasive image of corruption, fear, lack of discipline, poor working conditions and low remuneration, and excessive and erratic politicization (Republic of Ghana, 2006).

So if the bureaucracy has received bashings from successive Ghanaian governments for its inefficiency, ineffectiveness, and irresponsiveness, the question that then arises is: why has the Ghanaian civil bureaucracy remained an indispensable agent in the conduct of public business including public policymaking? This paper interrogates this question by addressing the following minutiae: (1) What role did the bureaucracy play in policymaking during the colonial era? (2) How does the role of the colonial bureaucracy compare with that of its counterpart in postindependence Ghana? (3) Has the role of the postindependence bureaucracy remained the same under successive governments? (4) What are the consequences of the static or changing role of the bureaucracy in policymaking? (5) What should be done to make the bureaucracy much more effective and efficient in the public policy process?

This article is designed such that part one accounts for the role of the bureaucracy in the colonial era. Part two traces the shifts in bureaucratic policymaking roles and relationships across regimes in postindependence Ghana. The third part examines the outcomes of the changes in the nature and extent of administrative involvement in public policy formation and execution. The fourth part explores ways to improve the efficiency and effectiveness of the bureaucracy in the public policy process.

## Perspectives on the Role of the Bureaucracy in Policymaking

Elected and appointed officers are partners in the governance process, by conducting the business of the nation by deciding policies, enforcing laws, and managing and evaluating numerous programs and projects. In essence, political executives and bureaucrats in different government ministries, departments, and related agencies set out what they envisage to achieve and set out methods and principles they will use to achieve their objectives. For the public, it is often quite formidable to discern who is actually making the policy choices or administering the policies decided on (Rashid 2014). This is complicated by the activities of a whole set of external actors and stakeholders, such as think tanks, interest groups, and the media, that interact with politicians and bureaucrats in myriad ways in an effort to influence policy decisions and outputs. In some cases, bureaucrats appear to be leading the policy process, while on other occasions, politicians are the dominant force (Rashid 2014).

A fundamental difficulty is to pinpoint and make sense of the highly variable line of interaction between politicians and bureaucrats (Jahan and Shahan 2008: 309). Some writers claim that it is difficult to make a distinction between the administrative and political worlds in government because of the ways in which they are intertwined with each other. Straightforwardly concentrating on the hierarchy of authority can be misleading as the actors involved have varying degrees of influence over different stages in the policymaking process. In addition, there are significant dissimilarities in political and policy processes between the levels of government (Svara 2006: 953). At the central level, respective ministers and senior bureaucrats are entrusted with the task of formulating national level policies, programs, and regulations. While some policy decisions are adopted within a single ministry, other policies are made in collaboration among several ministries or departments. At the local level, there are local government representatives and officials involved, sometimes operating with a degree of autonomy from the central level and at other times subject to

detailed monitoring and supervision from the center. Central-local differences affect how politicians and administrators interact with each other, as different actors and different forms of interaction and cultural dynamics are involved (Rashid 2014: 152).

In this paper, three perspectives are examined in relation to the roles and responsibilities of politicians and bureaucrats in Ghanaian public policymaking. One perspective opines that politicians are always in charge in the hierarchical relationship between political and top ranked public administrators. Thus, public administrators are subordinate to elected executives in both law and practice (Cook 2010: 276). Elected officials and administrators occupy separate spheres and have distinct roles and norms of behavior (Svara 2006: 954). In terms of policymaking functions, politicians decide on policies, while administrators implement these policies (Verschuere 2009: 23). Decisions on policy are to be taken by the political executives in parliament and government. Politicians and ministers are expected to set the goals and determine the instruments of policy. Involvement of administrators is more limited in scope, entailing the furnishing of information to the policy process and the supply of policy counsel. Bureaucrats, as neutral specialists, are expected to advise and outline the pros and cons of alternative courses of action. They are anticipated to quietly cooperate with politicians whether they agree or not. Then, upon a policy alternative being selected by the political executives, public administrators are expected to carry out the policy and monitor the results. Hence, their contribution is more supportive, providing important information and analysis for political actors. This view is predicated on the popular "politics-administration dichotomy" or "separate roles model," which proposes a clear disjunction between politics and administration (Jahan and Shahan 2008: 309; Svara 2006: 956).

The second model offers a more complex notion of the nexus between political and civil service officers. It postulates a more vigorous role for administration in policymaking and construes public administration from a policymaking standpoint. Bureaucrats do not simply act as neutral experts but are tortuously involved in and often lead in policymaking. Stahl (1981: 8) contends that in "viewing public administration as public policy making, it is appropriate to define public administration as the study or practice of the development, execution and evaluation of public policy." The "complementarity model" or "overlapping roles model" of politics and administration regards public administrators as actively involved in policymaking in collaboration with political actors (Svara 2006). There is latitude for extensive interaction, overlapping functions, and reciprocal influence between bureaucrats and politicians in policymaking. It assumes that administrators are active in a broad range of decisions including policy matters and that politicians are potentially involved in the detailed choices associated with administration (Rashid 2014). This perspective does not construe administrator as subject to political interference. Rather, it recognizes the value of responsiveness to public sentiment and a commitment to solving problems. Bureaucrats can be well within their rights to advocate and even fight for their own policy options. Therefore, administrators and politicians ought not to be adversaries but rather partners in a common pursuit who have different skills and priorities but whose ultimate goals are similar. This model is regarded as the predominant perspective of contemporary public administration studies (Rashid 2014).

The third model appreciates that the nexus between public administrators and politicians is riddled with tensions and conflicts. Disagreements arise because career bureaucrats and elected executives are operating with dissimilar precepts and anticipations regarding various reference groups. They have incongruent views of policy problems (Schmidt 2003: 297). Appointed officers, with their neutral expertise and many years of experience, tackle problems differently from political executives, who are balancing ideological norms and values and particular expectations from constituents or voters (Rashid 2014). Politicians can often control administrators with the aim of substantially diminishing the incorporation of independent professional contributions in policymaking (Svara 2006: 955). In some

cases, bureaucrats can be uncooperative and create barriers for elected officials in policymaking. They can sometimes treat the political element as intellectually inferior and untrustworthy and thus dislike working under the supervision of the political executive (Huque and Rahman 2003: 413).

The three models show that the way public administrators interact with politicians in the policymaking process can diverge considerably. Although three approaches have been explicated here, there is no implying that a particular setting can be clearly understood in terms of one or other of them. A complete disjunction between politicians and bureaucrats is a mirage. Although there can be clear departures in the world views of bureaucrats and politicians, there is the possibility of efforts to forge a partnership with them in the conduct of public business. It is erroneous to declare that one approach is most appropriate to the Ghanaian context or elsewhere.

The models that have been discussed here are based on a continuum along which the relationship between politicians and administrators can be conceptualized: separation and autonomy at opposite ends – following (Svara 2006). Separation denotes the extent to which political and administrative realms are distinct. Autonomy means the extent to which bureaucrats have the space or freedom to go about performing functions they are assigned without political interference (Aucoin 1990). I argue that although each one of the models explicated above, which either center on separation or autonomy or a combination of the two, captures a certain dimension of reality about politics-administration relations, none fully explains the whole picture. This is especially so in developing countries where the institutional and governance structures differ from those of advanced industrialized nations. In developing countries, literature is expanding on the process of reform highlighting the importance of politics-administration interactions in reform processes (Levy 2014). This research points to the extent to which politics-administration relationship in many developing countries differs from the Weberian ideal. Besides, it highlights the huge dissimilarities in the nature of the politics-administration interface across developing countries. The civil service in some developing countries "has power rivaling that of the political establishment" (Grindle and Thomas 1991: 60–61). In others, in contrast, governance is mired by the absence of a coherent bureaucracy (Evans 1992). In such scenarios, the Weberian model does not resemble the realities of politics-bureaucracy relations (Dasandi and Esteve 2017).

It is in the light of these divergent realities of the politics-bureaucracy interface in the Third World that I argue that there is no best practice model of politics-administration relations for developing countries. Rather I contend that the elements of the different models that are relevant to a particular context or decision process can be combined with local nuances to co-act to produce a best-fit model. I also claim that although proponents insist on the explanatory power of their models, almost all of them are silent on whether politics-administration relations are a static or a dynamic category. The few exceptions are Krause's (1996, 1999) and Dasandi and Esteve's (2017). But they too are mute over how changes in politics-administration relations in particular contexts occur in reality and the dynamics of the factors which cause changes in the politics-administration relations. They are also quiet on which of the factors has more explanatory power in a specific jurisdiction or specific episode of interaction. Static situations are fairly predictable over time compared to dynamic phenomena (Mohammed 2014). But since real-world phenomena are hardly static, it means politics-administration will continually change. This paper makes a contribution to the literature by focusing on the dynamic nature of the politics-bureaucracy relations in the policymaking process in developing countries using Ghana as a case. It does this by investigating how changes in the politics-administration relations occur as a function of the recurrently shifting interests of politicians and bureaucrats, power plays, information asymmetry, salience of issues, and strategies and tactics of participation and interaction during the policymaking process.

## Bureaucracy and Policymaking in the Colonial Era

British administrative practices and conventions have greatly influenced the ways in which higher level public administrators have been involved in public policymaking in Ghana and other former colonies of Britain. The broadly defined role assumed by bureaucrats in policy formulation and in the provision of even political advice can be viewed as a legacy of the colonial system of government that had been predominantly administrative in nature (Koehn 1990:2).

The governor was the British monarch's agent who administered the Gold Coast on behalf of the British Crown. In terms of policymaking, the system of administration required that major policies emanated from London, and the governor's standing instructions required that "all colonial bills, acts, ordinances and regulations should be sent for review" (Metcalfe 1964: 214). Nevertheless, in reality, he had wielded enormous powers and the latitude to govern virtually completely without let and hindrance by his bosses in London. In addition, he had powers of supplementary legislation, issuing of orders, and administrative regulation making to implement ordinances were conferred on the governor-in-council (Wright 1946). Furthermore, the governor was vested power to appoint the executive council, provincial and district commissioners, and extraordinary members to executive council sessions as he considered appropriate. Moreover, "reserved powers" of legislation were conferred on him. This was tantamount to veto powers with which he could reject or overrule any and all decisions taken by his executive or legislative councils (Knupland 1953).

The vast powers the governor possessed especially those relating to administrative ruling, issuing of orders, and veto power as well as appointment point to the type of relationship that existed between him and civil servants. That relationship was reminiscent of the separation model because policy initiatives emanated from the governor and the bureaucrat was supposed to carry them out even if he advised against those policies. In other words, the governor had firm control over bureaucratic behavior in policymaking. This picture painted of the governor-administrator relationship was completely true only for central bureaucracies located at arm's length to the governor at the capital.

For those civil servants in the provinces and districts, the picture was completely different. "Long-grade" officers, the junior ranks of the colonial administrative service, ruled the native population in the provinces and the districts, at the lowest level of the colonial bureaucracy. From the beginning, this category of staff embraced only the assistant district commissioners, district commissioners, and provincial commissioners. Later an even more junior rank, the cadet, was added (Wright 1946: 208). Despite the fact that these officers ranked lowest in the hierarchy, they wielded enormous powers and decision-making autonomy due to the ubiquitous poor communication network between their locations and the capital where the higher officers were stationed. Their discretionary power later declined as communication improved; nonetheless, they unremittingly wield considerable amount of power (Asante 2005).

The duties and responsibilities the district officers assumed were wide ranging. They included immediate agents of the governor in their districts; magistrates and political officers (the officers in charge of the maintenance of satisfactory relationships between the natives and the central administration); policing, district financial accounting; prisons; road construction waterway clearing; and any other public works (Asante 2005).

Traversing the length and breadth of their district was a prerequisite for officers if they were to effectively manage their districts. In the course of touring, the district officers inspected the outlying areas, transacted any necessary business with the native chiefs, settled disputes between individuals and committees, and generally dealt with all matters requiring the personal attention of the representative of the government (Kuklick 1979). There was virtually no limit to the responsibilities of the district officers. This explains why the Legislative Select Committee's report on the

Africanization of the Gold Coast public service published in 1951 could only describe the duties of the district officer in very vague terms. The report read: "The duties of an Administrative Officer are so wide and varied that they cannot be set out in detail" (Kuklick 1979: xi).

Despite the fact that district officers ranked lowest in the colonial bureaucratic hierarchy, they were the chief executors of government policies. They were the persons on whom the success or failure of policies mainly were relied upon (Guggisburg 1926). In the colonial order of things, instructions on policy were transmitted from the governor through a secretariat at the headquarters to the provincial officers and then to the district officers. The district officers being at the local level of the administration were in the best position to evaluate the outcomes of policies and give feedback to their superiors at the center (Asante 2005).

Even though the formal procedures of operation of the government meant that the district level bureaucrats could not ignore the instructions from their superiors, their modus operandi explicitly reveals that in their minds and actions, formal policy was almost unimportant. Readily available on the ground and virtually unsupervised by their superiors, the local-level bureaucrats arrogated to themselves the power to interpret policies and enforce them employing their own judgments, principles, and discretion. A case in point was in 1924 when the Chief Commissioner of Asante lamented the district officers' ignorance of the legal constraints on their own authority and their persistence in the practice of so-called personal administration (Lumley 1976: 6; Hagan 1926).

The district officers' reputation for disregarding central directives prompted Kuklick to describe them as "dictators" who employed "whatever tactics seemed necessary to realize their objectives" (Kuklick 1979: 70). Due to their overwhelming obligations together with the incapacity of their superiors to exercise oversight of their activities, the district officers had large latitude of freedom to exercise infinite alternatives in defining their work. At the very least, their responsibilities required the guaranteeing of the security, maintaining order, and demonstrating British rule and control. In an attempt to fulfill this mandate, their propensity to act in an arbitrary and authoritarian manner was very high (Kuklick 1979). The district officers were "simply implementers with few restrictions on their scope of functions as well as their power to undertake those functions" (Asante 2005: 61).

The foregoing indicates that senior bureaucrats at the capital operated according to the separation model or politician-bureaucrat dichotomy. This is because decisions on policy were taken by the governor and his political appointees on the executives and legislative councils. The governor generally set the goals and determined the instruments of policy. Involvement of administrators was more limited in scope. In contrast, junior officers in the provinces and districts conducted public business on the basis of the complementarity model. That model assigns a more vigorous role for public administrators in policymaking and conceptualizes public administration from a policymaking perspective. It sees bureaucrats' active participation in policymaking in collaboration with political actors (Svara 2006). It is from this prism of bureaucratic agency that Stahl (1981: 8) insists that it is appropriate to define public administration as the "study or practice of the development, execution and evaluation of public policy."

## Bureaucracy and Policymaking in the Immediate Postindependence Period

The colonial architecture of public administration was bequeathed to all independent nations. The British model, which Ghana inherited, was predicated on a ministerial view of government structure. Under this structure, appointed career bureaucrats are found in almost all positions in the upper levels of the hierarchy (except as ministers) and therefore control most of the key positions in the decision-making process. This has been maintained as the fundamental model of administrative organization (Bienen and Fitton 1978). This structural organization has expedited far-reaching bureaucratic participation in policy formulation, advocacy, and implementation.

Ghanaian civil servants enthusiastically embraced a norm of administrative behavior which not only allows but also anticipates that high-ranking bureaucrats will both take the initiative in developing public policy alternatives and implementation strategies and in advising their ministers on the implications of policy options open to the government (Adamolekun 1978; Ayee 2001; Bach 1980).

During the colonial era, expatriate bureaucrats occupied the apex of the public administration system, while natives were situated down the hierarchy. At the advent of independence, there was the need to replace all expatriate bureaucrats in an effort to dismantle the residual apparatus of imperialism under a policy known as the Africanization of the civil service and the pursuit of rapid socioeconomic transformation (Adarkwa and Ohemeng 2015).

The relationship between the politician and the bureaucrat in the period between 1957 and the end of the Nkrumah's regime in 1966 and even beyond is aptly described as one of master and servant (Appiah 2006; Ayee 2013). The elected officers dominated the conduct of public affairs including public policymaking, and this dominance has persisted to date. Bureaucrats continue to be precluded from the public policymaking process (Ohemeng 2005; Omaboe 1966). One of the important ways that was applied to exclude public administrators from public decision-making processes was through the establishment of executive or presidential commissions, which were separate from and external to the civil bureaucracy. These commissions crafted policy proposals and workable solutions to public problems to herald parliamentary consideration, executive acquiescence, and concretization into projects and programs (Ohemeng and Ayee 2016).

The desire to achieve rapid socioeconomic transformation within the shortest possible time in order to improve the living conditions of Ghanaians necessitated the reorientation of the bureaucracy toward political freedom. This engendered a hostile relationship between politicians and bureaucrats (Amonoo 1981). Elected officials arrogated to themselves the design and execution aspects of the policymaking process leading them to have an urge over public administrators in both realms (Omaboe 1966). The alienation of the latter bred resentment and led to distrust between the two categories of officials during the reign of Dr. Nkrumah-led CPP government. The frustration of Dr. Nkrumah especially about the bureaucracy stemmed from the fact it was considered too slow to act – a perceived attribute which was thought to be undermining the achievement of the political goal of rapid socioeconomic development (Gyimah-Boadi and Rothchild 1990). Accordingly, this fed the impetus for the extreme politicization of the bureaucracy, with occupants of the top echelons of the hierarchy being replaced as heads of institutions by party members (Appiah 2006). This view corroborates Gyimah-Boadi and Rothchild who aver that Dr. Nkrumah resolved that, "he would see to it that there were no 'civil masters' as under colonial rule but civil servants carrying out the policy decided by the cabinet" (Gyimah-Boadi and Rothchild 1990: 233). The two scholars assert that "senor officers were regarded with suspicion," which culminated in their loyalty being thrown into question. The Nkrumah's regime ensured that the bureaucracy was firmly brought under the control of the political executive (Ayee 2001).

An effective strategy Dr. Nkrumah's administration adopted to bring the bureaucracy firmly under political control was the establishment of several parallel bureaucratic apparatuses, to carry out national development (Amonoo 1981). These parallel bureaucratic structures included state-owned enterprises, specialized secretariats like State Planning Commission, the Productivity Center, the Water Resources and Power Secretariat, and the Civil Service Commission. All these institutions were outside the regular public services and brought under the Office of the President, who exercised direct control over appointments (Ohemeng and Anebo 2012). This deteriorated the already frosty relationship between bureaucrats and the Nkrumah's government because it not only over-politicized the public service, but it also created coordination problems for it in national development efforts. This was because some of the organizations and

sectors became silos which grossly undermined sociopolitical and economic growth (Ohemeng and Ayee 2016). Accordingly, an administrative confusion was created for the state, a labyrinth which Amonoo (1981) aptly characterized as "the politics of institutional dualism." By 1966 when Dr. Nkrumah's government was overthrown, the relationship between the politician and the bureaucrat was one of "uneasy tension" (Adarkwa and Ohemeng 2015: 15), with the latter more or less relegated to the background in terms of voice possession in the setting of an agenda for national development (Amonoo 1981).

The first military takeover occurred in Ghana on February 28, 1966 when a military junta known as the National Liberation Council (NLC) toppled the first postindependence government led by Dr. Kwame Nkrumah. Initially, the NLC attempted to depoliticize the civil service. It made strides to create a cordial relationship with public administrators by substituting politically appointed regional and district commissioners with administrators who were civil servants (Gyimah-Boadi and Rothchild 1990). These bureaucrats at the regional and district levels were charged with deciding on issues of regional and local relevance and of implementing central policies at those levels. In respect to economic policymaking, the military junta enticed the participation of the bureaucracy in conjunction with the business community in the NLC's National Economic Council (NEC). The council exercised control over economic policies. The membership of NEC included five senior civil servants and two financial professionals. The governing style of the NLC and NEC, according to Kosack (2012), was reminiscent of the approach of the British. That approach ensured that public administrators were at the center and administered the local level via alliances with tribal chiefs and through central appointed bureaucrats.

The NLC appeared not to have the know-how to govern as was remarked by one of its leading members, Colonel Afrifa. He said that, as soldiers, they were not cut to govern. Thus, they envisaged that they would serve as a stopgap measure – topple the Nkrumah's regime, put things in order quickly, and hand over power to a civilian-elected government. They had no other program or plans other than overthrowing the Nkrumah's government and installing themselves in power (Asante 2005).

For this reason, although the NLC had ultimate power for the conduct of public affairs, it depended almost entirely on the civilian bureaucracy and the intelligentsia as the principal instruments for governing including policymaking and implementation (Adu 1965). For the first few months after the 1966 coup, Ghana was virtually managed by civil servants, and this role expanded over time. Despite the fact that senior military officers were appointed to head government departments and the administrative regions of Ghana, and the NLC remained the de jure executive and legislative authority (Baynham 1988), in reality, civil servants were the sources of policy ideas. Public administrators were also in charge of converting such ideas into official policies, and for their implementation (Asante 2005). In responding to criticisms that the NLC was a government of bureaucrats, Major General Ocran, another member of the junta, averred that, "I have yet to see a government in any part of the world which does not rely on civil servants for advice or even initiating policies" (Ocran 1977: 88). In digressing he conceded that a government becomes one that is run by civil servants "if those at the helm have no clear-cut policies" (Ocran 1977: 88). This admission goes to buttress the point made by Colonel Afrifa that the military was wanting in terms of requisite expertise and skills in the area of government and therefore relied on civil servants to fill the void.

The consequence of the excessive dependence of the NLC military government on civil servants was that it weakened the dichotomy between the realms of politics and administration, which was drawn by Woodrow Wilson. According to him, "Administration lies outside the proper sphere of politics. Administrative questions are not political questions. Although politics sets the tasks for administration, it should not be suffered to manipulate its offices. The field of administration is a field of business. It is removed from the hurry and strife of politics. . ." (Wilson 1887: 209).

In other words, while policies were to be debated and decided by politicians, they were to be carried out by a politically neutral, professional bureaucracy. In this fashion, the everyday conduct of government would be isolated from the potentially "corrupting influence" of politics (Denhardt 1995). The dichotomy has been advocated on the grounds that the "dichotomous division of labor and authority between elected and administrative officials increases the democratic accountability and planning ability of public administrators" (Demir and Nyhan 2008: 81). However, Since Wilson's time to date, the politics-administration dichotomy has been one of the most hotly contested theories of public administration. Some scholars describe it as a "myth," while others label it as an "aberration" (Overeem 2012). Most of the academic treatises have concentrated on the interactive relationships between politics and administration as well as on the impact of political interference into democratic government operations (Demir and Nyhan 2008).

The NLC handed over power to the civilian-elected government of Dr. K. A. Busia (1969–1972). Like the NLC regime, technocrats were drafted externally including those who had worked with the World Bank and the IMF (Libby 1978). It was clear that the policy terrain was dominated by politicians and bureaucrats from international governmental organizations, which led to loss of policy ownership by local decision-makers (Libby 1978).

Decision-making which was supposed to be consultative rather was increasingly centralized (Government of Ghana 1969). The position of president was purely a ceremonial office, and because of a lack of a countervailing center of power, the Prime Minister, Dr. Busia, quickly consolidated decision-making powers in his office and his advisors.

In conflict with the spirit and letter of the constitution, the Local Administration Bill which was put together by the governing Progress Party – the majority in parliament, gave the Busia regime control over both the regional and district administrations. The excessively powerful executive as under the Nkrumah's government was reincarnated under the Busia's administration. The bill vested in the prime minister the power to appoint chairpersons of regional and district councils. Furthermore, the instruments of appointment based the tenure in office of such appointees upon "such terms and conditions as may be specified by the Prime Minister" (Chazan 1994: 46). Accordingly, regional and district administrators were effectively placed under the control of the executive. The historically hierarchical character of Ghanaian public policymaking architecture was thus perpetuated with politicians having stations at the apex of the structure of government. While the public administrators at the national and local levels advised the politicians and carried out the intricate and technical tasks involved in policy formulation and implementation (Asante 2005).

Even though the Busia government appeared to have taken charge of public policymaking and diminished the status of the bureaucracy, the entrenched position and level of influence of the bureaucracy in Ghana was demonstrated, even reenforced, during this regime when the firing of the manager of Ghana National Trading Corporation (GNTC), a state-owned commercial enterprise, was overturned by the Ghanaian Court of Appeal (Frempong 2007). The bad relationship was made worse by the dismissal of 568 civil servants. While the government cited incompetence and inefficiency as the reasons for its action, many observers believed they were politically motivated. The political motivation thesis is supported by the fact that a disproportionately large fraction of the dismissed was sympathizers of the Nkrumah's regime (Frempong 2007). The court order to reinstate the dismissed public servants fell on deaf ears. In fact, it is widely held that the dismissal of 568 bureaucrats by the Busia government eroded much of its popularity among citizens and helped to trigger the coup d'etat that terminated its rule.

The National Redemption Council (NRC) under the leadership of Colonel Acheampong overthrew the Busia's government and ruled from 1972 to 1979. Under Colonel Acheampong's rule, the centralized character of decision-making was perpetuated. However, unlike the predecessor NLC, the Acheampong-

led NRC intended to stay long in power. This is demonstrated by the appointment of military officers into administrative and managerial positions in virtually every realm of the political and economic activity of the country (Boahen 1988). Military involvement and control of the policy process extended to all levels of the government, surpassing what obtained under the NLC, the first military government.

The public policymaking style of the NRC was not significantly different from those adopted by its predecessors. That style reflected a highly centralized administration, with all major policies emanating from the central government. The NRC possessed ultimate power and took credit for all policies. The relatively junior military officers who were appointed to head the regions and public corporations did not possess much policymaking authority, but simply took orders from government authorities in the capital and reported back to them.

The inadequacies in terms of expertise on the part of NRC members, like its predecessor NLC, made them to rely greatly on public administrators. The appointed officers filled the void by assuming the responsibility for the highest level government functions and therefore became the fulcrum for the administration of the country. Nevertheless, the imperative to exercise full control over the country was unremittingly the preoccupation of the chairman of the junta and his ruling members. Accordingly, they interfered in the work of the public administrators, overruling them and imposing their preferred policies (Asante 2005).

It is believed that General Acheampong (promoted himself from colonel to general) was intellectually less superior to military men and women of his generation. He was portrayed as a man who was not favorably disposed to hard facts or administrative details (Oquaye 1980). Because he was also reported not having the capacity for undertaking the job of running the government, he depended even more heavily on bureaucrats and intelligence aides. This was despite his lust for power and desire to take control of the public policy apparatus (Asante 2005).

The military governments of Acheampong and Akuffo were overthrown by junior military officers under the leadership of Flt. Lt. Rawlings in 1979. The Armed Forces Revolutionary Council (AFRC) was the new military government which ruled for less than a year and handed over power to a civilian-elected government of Dr. Hilla Limann. The government was no different from its predecessors in terms of its approach to policymaking. That approach was the established disproportionately strong state which vested policymaking power exclusively in the president and closest associates. The role of the bureaucracy was relegated to bringing the facts to the table and advising on policy without any real opportunity to influence policy (Callancy 1974).

Flt. Lt. Rawlings of the Provisional National Defense Council (PNDC) toppled the Limann's administration on December 31, 1981. From then onward to the end of 1992, the PNDC ruled Ghana. One of the reasons for the Rawlings' coup was that the Limann's government, like its predecessor, had alienated the people from the public affairs including public policymaking. He found unacceptable the domination of Ghanaian politics and public policymaking by politicians, bureaucrats, and other elites to the exclusion of the other groups particularly workers and rural folks.

Before the advent of the PNDC, the civil service had witnessed most critical and trying times that arose mainly through the economic crisis that plagued Ghana from the 1970s. From 1974 to the early 1980s, the Ghanaian economy was in decline, unable, for a combination of structural and policy-based reasons, to seize the initiative and overcome the constraints on choice (Rothchild 1991). Declining agricultural and industrial productivity, in some cases despite rising international market prices, contributed substantially to the country's economic malaise during the 1970s and 1980s. The consequence of the economic downturn for the civil service was the erosion of its pay through hyperinflation which led to its cream of the crop leaving the country to escape the harsh economic realities and to seek greener pastures (Adarkwa and Ohemeng 2015; Werlin 2003). The skeleton staff who remained found the task of administration

overwhelming, and this made it quite formidable to deliver basic services. Nti (1978: 2) characterized the civil service at the time as "a moribund paper-pushing institution" to perhaps presage the inefficiencies and ineffectiveness that bedeviled it.

The PNDC partly blamed the bureaucracy for the inefficiencies and ineffectiveness in the conduct of public business and for the socioeconomic development problems of the country. This negative opinion formed about the bureaucracy defined its relationship with the government. Not surprisingly, when the government launched its economic recovery program of 1983, the civil service and especially those at the top echelon of the service were precluded from the design and even the execution of the program's critical parts (Adarkwa and Ohemeng 2015).

The PNDC envisioned that for the civil service to be effective it needed a transformation which would remove the bad nuts, reorient its culture, sharpen its skills, and enhance its responsiveness to public service customers. Accordingly, many civil servants were summarily dismissed, while others were accused of corruption and incompetence. Those who were accused of corruption were arraigned before the freshly constituted public tribunals and slapped with long prison sentences (Gyimah-Boadi 1994).

The PNDC maiden reform was kicked started with the setting up of the Kaku Kyiamah Committee in May 1982 with a mandate to advice the junta on restructuring the bureaucracy (Ayee 1993). Among others, the committee recommended that the civil service should (1) restrict itself to policy formulation, (2) provide the administrative support units for political heads, (3) coordinate and monitor programs and activities within the ministerial sector. and (4) conduct interministerial relationships. In addition, it advised that, "the politicization of the position of the principal secretary" was in order. This, the committee reasoned, was due to the fact that some of the principal secretaries cultivated the habit of "resisting or blocking the flow of professional advice direct to the political head" (Wood 1984: 46). This charge, however, was untenable because the committee could not produce any solid evidence to back its claim (Wood 1984). Another suggestion it tabled was the obtaining of advice from plural sources both external and internal. From the internal sources, all heads of directorates in a ministry were to be permitted easy and equal access to tender advice to the political head.

The recommendations attracted a receptive political ear which triggered some structural changes, embracing the redesignation of the position of principal secretary to that of chief director. The chief director was appointed on the basis of both merit and partisanship. Ascension to the position was no longer to be based on career progression in the service, but outsiders were also eligible for consideration for appointment (Barnes 2014). By these changes, the bureaucrats felt debased, and this fed the already frosty relationship that generated between it and the regime following the mass dismissals and imprisonment of some of its members. This bitter relationship even got worse when the government established revolutionary organs.

The policy influence of public administrators was further weakened by the creation of revolutionary organs such as People's Defense Committees (PDCs) and Worker Defense Committees (WDCs). These PDCs and WDCs were established in various cities, towns, and workplaces, including the civil service. The WDCs were formed and charged with the responsibility of helping in the development and implementation of government policy. They enforced price controls and curfews, supported rent controls, and investigated malfeasance in public and private sectors (Adarkwa and Ohemeng 2015). In contrast, the PDCs were created under the directorate of a coordinating committee that comprised representatives from all the reformist political organizations. Their establishment represented an aspect of the regime's schema to introduce new layers into the structure of the planning and implementation of government programs. In this way, it was envisioned that it would decentralize the administrative structures and create a parallel source of policy ideas as well as spur the execution stage of the policy process which was considered as a defective link. The PDCs were meant

to organize development programs in factories, banks, and institutions as well as serve as vigilantes for the government (Adarkwa and Ohemeng 2015). These new and parallel structures were meant to end the monopoly of the bureaucrats over public policy advice, gather and analyze data, propose alternative solutions to policy problems and draft legislation; and write policy briefs.

Another measure that undermined the role of the civil service in public policymaking was the appointment of political advisors to the chairman of the PNDC. The political advisors were two in kind: security advisor and general political advisor. The security advisor was a retired army captain, Kojo Tsikata, who advised the chairman of the PNDC, Flt. Lt. Rawlings, on all matters relating to national security. The general political advisor was the late Mr. Paul Victor Obeng who was in charge of giving the chairman good counsel on all matters bordering on national and international policy issues and problems.

The creation of the political advisor positions added powerful noncareer competitors with whom top civil servants and the head of the civil service vied when attempting to influence decision-making. Special advisors hold temporal political rather than civil service appointments and serve at the pleasure of the head of state. The authority and influence of special advisors rivaled or exceeded those exercised by many ministers. Furthermore, permanent secretaries (chief bureaucrats of ministries) no longer served as the administrative heads of their ministries, regions, and districts. Their positions were filled by political appointees who had the delegated responsibilities of the head of state.

The 1992 Constitution and some pieces of legislation such as the Civil Service Law 1993 and Civil Service Code of Conduct 1993 have diminished the influence of public administrators in public policymaking. Under the last two laws, bureaucrats are obliged to demonstrate political neutrality. Political neutrality implies that as neutral specialists, bureaucrats are expected to advise and outline the pros and cons of policy options. They are anticipated to quietly cooperate with politicians whether they agree or not. But this view is challenged on at least two grounds. First, the public service is inherently a political creation and thus can never be made fully apolitical (Peters and Pierre 2004). To Christensen and Laegreid (2004), therefore bureaucrats, in delivering a public service to the citizens, inevitably participate in the political role of "deciding who gets what" from the public sector. Second, the merit principle is counterproductive as it implies the appointment of value-free bureaucrats who will administer public policies regardless of their impact on society and thus may be apathetic and hostile to the programs of a political party in power (Cameron 2010). It is also known that politicization of the bureaucracy has its drawbacks. Some of the negative effects of politicization include undermining of the merit-based systems of employment and promotion, efficiency, professionalism, weakened trust among actors in the external environment, loyalty to the government of the day, loss of expertise, low morale among existing public administrators, and widening of the gap between senior public servants and rank and file (Cameron 2010).

The numerous public sector reforms that have been introduced and continue to be introduced have served to continually redefine the relationship between the politician and the public administrator. The constitution has vested the president with vast powers of appointment. His power to appoint the head of the civil service and chief directors of the various ministries conflicts with the arrangement in the civil service where directorship is attained via career progression (Adarkwa and Ohemeng 2015). These appointments do not require legislative endorsement, and this implicitly grants the president power to transfer and remove from office those individuals serving as head of the civil service, chief directors, and heads of department. This has greatly circumscribed the authority of the Civil Service Commission which is mandated under the Civil Service Law 1993 to appoint, transfer, discipline, and fire a civil servant based on specified guidelines.

The primary criteria for appointment as chief director have become explicitly political. The most important yardsticks for appointment now

are competence, loyalty, and total commitment as well as political affiliation. This ties in with Cameron's view that, "incoming governments should have the right to replace staff in selected senior positions with individuals who share their ideological beliefs, provided they are administratively competent" (Cameron 2010: 679–680). These changes undoubtedly have offended the inherited British convention of bureaucratic neutrality and anonymity (Heady 1984). The shifts are instead toward greater politicization of top bureaucratic positions that characterize the US and French presidential systems of government (Ayee 2013). It is anticipated that those who are appointed to the positions of the head of civil service and chief director will pursue with absolute commitment the manifestos, programs, and policies of the ruling government.

## Outcomes of Bureaucratic Involvement in Public Policymaking

The consequences of bureaucrats' participation in public policymaking are numerous and considerable. Civil servants helped the NLC government (1966–1969) to adopt and implement three major policies: restoration of budget stability, balancing foreign trade, and consolidation of foreign debt (Joeng 1998). This was done through cuts in public expenditure and imposition of severe restrictions on imports and external borrowing. These measures were successful in reducing inflation by 50% between 1966 and 1967, but at the expense of greater unemployment and slower economic growth.

Civil servants also assisted Colonel Acheampong's NRC to implement a self-reliant development strategy that reversed trend toward liberal economy. To reduce Ghana dependence on foreign exchange, self-sufficiency and regulation on imports were stressed to the neglect to expanding exports. They also influenced the NRC to embark on rural development and enhance the terms and conditions of public sector employees (Joeng 1998).

Another is during the late 1980s' declining economy translated into deteriorating health service delivery due to the lack of medicines, consumables, and equipment. In response, medical and pharmaceutical bodies advocated for the introduction of hospital fees to revive falling standards of health care and threatened to strike (Daily Graphic, 1981). Health workers unilaterally introduced de facto hospital fees as a result of the economic crisis and shortages of health service inputs. Consequently, a later Ministry of Health (MOH) 5-Year Program of Work report showed an increase in national maternal mortality rate estimate of 214 per 100,000 live births. In response, a maternal fee exemption was introduced by government. However, at the implementation stage, instead of providing a gamut of free maternal services irrespective of frequency of attendance as the government directed, the health management allowed fee exemption for only four antenatal visits, and further visits had to be paid for as well as deliveries and postnatal care (Koduah et al. 2015). This exacerbated the already poor maternal mortality statistics as mothers who could not afford repeated visits simply stayed away.

In contemporary times, the bureaucrats have influenced policymaking in other areas. These areas include, among others, adoption of new immigration policy, reforms to the pension scheme, adoption of Ghana Poverty Reduction Strategy, National Health Insurance Scheme, hospital fee exemption policies, low-cost housing for public servants, and Single Spine Pay Policy.

For example, in regard to a new immigration policy, the bureaucrats were most influential as policy entrepreneurs. Bureaucrats in the Ghana Immigration Service used information exchange, increase attention to immigration issues, upsurge the knowledge of policymakers on immigration matters, and convince policymakers to endorse policy reforms. These efforts begot a new immigration law or policy known as the Ghana Immigration Service Act, 2016 (Act 908). The new law addressed the shortcomings that were associated with the previous laws. These shortcomings, among others, included the lack of power to bear arms to protect the country's territorial borders (which exposed the country to illegal migration with its attendant security threats); the existing GIS arrangements have limited operational

structures which prevent the effective discharge of the organization's mandate. The new law has addressed the problems the immigration officers complained about, and this has spurred efficiency and effectiveness in the discharge of immigration responsibilities.

Bureaucrats have historically since independence in 1957 advocated for better terms and conditions of service including handsome remuneration. The Civil Service of Ghana is a huge entity of about 470,205 who influenced the government to pass a Single Spine Salary Structure (SSSS). The Ghana Universal Salary Structure (GUSS), the predecessor of the SSS, was introduced in 1997 to address anomalies, disparities, distortions, and inequities in the public pay structure. The GUSS was hailed as the first holistic public sector pay reform. Before, the GUSS civil servants' agitations for better remuneration and other conditions and terms of service led to the setting up of commissions and committees to investigate and give recommendations to inform policy. Among others, these included the Gyampo Commission (1992–1993), the Azu Crabbe Commission (1979–1983), the Issifu Ali Committee (1973), and the Mills-Odo Committee (1967). Notwithstanding the efforts of these commissions and committees to tackle the problematic post-impendence public pay system, these initiatives could not adequately and satisfactorily address it. The SSSS therefore did a better job of rationalizing, creating equity, and ensuring transparency in the pay structure.

Despite these positive influences of the bureaucracy on the public policymaking process, there are reservations. Some critics charge that public administrators have most effectively used their social status and political influence in shaping public policies that promote their own personal and/or collective interests. People have criticized the SSSS, for example, as a huge impost on the public purse, but civil servants have not matched the enhanced remuneration with higher productivity. Others have also lamented that bureaucrats have done little to influence policies that promote informal sector development and especially in addressing the urban-rural development gap. They charge that bureaucrats have not exercised developmental leadership via example, sacrifice, and primary commitment to the needs of the poorer segment of the population.

## Measures to Improve Bureaucrats' Role in Public Policymaking

The criticisms of the public administrators' role in public policymaking have led to calls for a new public service, which is built on democratic citizenship, community and civil society, and organizational humanism and discourse theory (Denhardt and Denhardt 2000). This new orientation will entail several changes in the modus operandi of the civil service as far as public policymaking is concern.

First, bureaucrats must understand the simultaneous emphasis on separation and insulation of administrators from political interference, on one hand, and interaction and incorporation of administrative contributions in the design and implementation of public policy, on the other hand, is a balancing act. Their ability to conduct this balancing exercise will ensure they built partnership with politicians in the process of governance. An exclusive focus on political bias of administrative executives potentially results in suboptimal policy options being suggested and adopted. Such bias through politicization can reduce the morale of public administrators and erode their efficiency and effectiveness. On the other hand, an excessive concentration on administrative neutrality of the public service is inherently a political creation and thus can never be made fully apolitical (Peters and Pierre 2004). This is because in delivering a public service to the citizens, bureaucrats inevitably participate in the political role of "deciding who gets what" from the public sector.

Second, a widely held view is that public administrators are generally apathetic to the needs of the public and are not inclined to listen to them (Jahan 2006). This unfriendliness and elitist behavior is a service culture that is inherited from the colonial administrative system. This culture was geared toward serving the imperial interests of the empire rather than the native population. The colonial legacy has made the

bureaucracy quite detached from the general society (Jahan and Shahan 2012).

However, since good policymaking now depends on an exchange between people and their government, it is important that the bureaucrats like politicians should connect with the public. This will enable to access insights that will facilitate the development of better policies. They should regularly link up with the public so that they can understand social dynamics that can inform policymaking endeavor. For example, public administrators' interaction with the media can potentially provide important insights on social and economic trends that can inform policy decisions. Moreover, engagements with think tanks and NGOs which conduct research on socioeconomic issues have relevance for the bureaucracy. This is because such institutions can provide policy alternatives; they furnish the investigative skills to uncover a problem and the creative spark to develop a new solution; they provide basic information and data on policy issues; they design options and suggestions for dealing with problems; and they assess the effectiveness and consequences of public policies (Maddison and Denniss 2009). Collectively, they add substance to policy debates (Anderson 2006: 62).

Finally, the capacity of civil servants should be enhanced so that they can contribute efficiently and effectively to policymaking. In Ghana, the civil service suffered a gradual erosion of collective technical and procedural capacity to play a proactive role in policymaking. Public administrators often lack knowledge and skills relevant to their areas of work, are unclear about their duties and responsibilities, and lack knowledge of rules and procedures, all of which imperil the performance of policy functions.

A related factor is that the top ranks of the Ghanaian civil service are filled by generalist officials who are not specialists in their respective areas. Generalist staff (also referred to as administrative cadre) make up about 82% of all senior ranks in the civil service, making them to dominate in the conduct of government business. Because they populate the policymaking arenas, they are unwilling to embrace the contributions of specialists or professionals who have the substantive expertise. The predominance and urge of the generalists over the subject specialists potentially weakens the policymaking and management functions of ministries and divisions.

There should therefore be emphasis on specialist training and education in the selection process into the administrative class. There should be organizing on a regular basis both in-house and external training for those who are already career public administrators. The training should emphasize the development of bureaucrats' research capacity to enable them address and propose more informed and analytically sound policy alternatives.

## Conclusion

This paper sets out to assess the role of the bureaucracy in public policymaking in Ghana. The evidence showed that the public administrator's role in the policy process has oscillated between the continuum of separation and autonomy. Separation denotes the extent to which political and administrative realms are distinct. In the separation model, public administrators are subordinate to elected executives in both law and practice. Politicians and ministers are expected to set the goals and determine the instruments of policy. Involvement of administrators is more limited in scope because they are expected to be neutral specialists, are expected to advise, and outline the pros and cons of policy options. They are expected to quietly cooperate with politicians whether they agree or not. This politician-administrator dichotomy seemed to characterize public policymaking in the immediate post-independence democratically elected government of Nkrumah. The Busia and Limann's short-lived democratically regimes also followed the separation model of policymaking. However, during the military regimes of the NLC and NRC, the bureaucrat assumed a prominent role in the hierarchical relationship bringing not only facts to the table. But also bureaucrats initiated policy and lobbied and pressured for their adoption because of their substantive expertise which the military

lacked. In other words, the said military juntas operated by the autonomy or complementarity model. In this perspective, a more vigorous role is assigned to administration in policymaking and conceptualizes public administration from a policymaking perspective. Public administrators do not simply function as impartial technicians, but are intricately involved in and often lead in policymaking. This is a paradox when the model employed in the democratically elected governments of Nkrumah, Busia, and Limann is juxtaposed with the complementarity model of the military regimes of the NLC and NRC. This is because it is only in a democracy that differing values and interpretations of factual evidence can be mediated (Steelman 2001). It is also a paradox because it is commonly believed that the military excludes the citizens including bureaucrats from the development process by allowing only the few governing elites to make authoritative allocation of values for the rest of society (Handelman 2006). In the new democratic dispensation, there is proclivity toward the separation model as the NPM reforms have encouraged it. This has resulted in the over-politicization of the bureaucracy. This has resulted in, among others, the undermining of the merit-based systems of employment and promotion, efficiency, and professionalism.

Public administrators have provided vital support for major policy initiatives including among others the drafting of decrees, edicts, and budget allocation affecting economic growth, infrastructure development, rural development, local government jurisdictions, structure functions, and wage and salary levels. Despite these strides, some observers have criticized that the bureaucracy has not demonstrated developmental leadership via example, sacrifice, and primary commitment to the needs of the poorer segments of the population. Since the bureaucracy's role in policymaking is unlikely to diminish, suggestions have been offered to make it much more efficient, effective, and accountable. These include, among others, balancing the political and apolitical, capacity building, and engaging with think tanks and NGOs.

# Role of Community-Based Organization to Combat Corruption

Nurul Huda Sakib
Department of Government and Politics, Jahangirnagar University, Dhaka, Bangladesh

## Synonyms

Civic engagement to combat corruption; Localism in anti-corruption; Neighborhood in anti-corruption

## Defining Community-Based Organization

The term "community" could be defined as a group of people who are living in the same place and participate in achieving their common interests. What it suggests is that community is developed by a systematic, interactive, and interdependent relationship with each other. It also heavily relies on shared history, mutual expectations, predictable roles, values, norms, and patterns of status differentiation (Brager et al. 1987). The sense of a community then leads to community organizing. Therefore, community-based organizations (CBOs) are defined as an organized community group that is directed by some goal/s (social, political, economic development) to serve the common interest of the community. They may be nonprofit or volunteer-based, but they can be formed to achieve direct profit as a community. Either way, the goal of the CBOs is to preserve community interests.

## Why is the CBOs Role in Anti-Corruption?

Community engagement in public affairs has made a significant contribution to public service delivery and on local issues through leadership and decision making. The past few decades have seen tremendous growth in citizens' engagement through community development committees, citizen

satisfaction surveys, public consultations, participatory planning, budget consultations, and social audits (UNDP 2016). Citizens' engagement involves citizens in the form of individual or collective action (including that in civil society organizations) (Joshi 2007). Considering the modern governance regime, Putnam et al. (1994) argued that if citizens in a "civic community" demand better public services and collaboration, public sector officials become more aware of their responsibility for civic duties. Conversely, in less open societies, people do nothing to create a civic community and instead become isolated and suspicious.

Similarly, Sen (1999) argued that citizens' engagement provides people with the opportunity to speak up against injustices and discrimination. Citizen engagement fosters human capabilities, promotes fundamental freedoms, and contributes to people's well-being and quality of life. For example, Achwan and Ganie-Rochman (2009) suggest that the aim of community organizing is doing something beneficial for the citizens of the locality. Therefore, the trend has also become popular in anti-corruption in modern days. At the same time, there are few separate reasons to gain popularity of CBOs in anti-corruption.

First, it has been a common trend all over the world that there have been few successful efforts in combating corruption via existing institutions, such as the anti-corruption agencies and other watchdog agencies through a top-down approach. Indeed, in some cases, these institutions have been used to institutionalize corruption. Overall public trust in these institutional initiatives is shallow, so they have little legitimacy. These institutions often encouraged ceremonial displays of anti-corruption activity, while program overreach relative to available resources has created state capability traps.

Second, in many developing countries, the necessity for petty corruption has gained societal acceptance. This necessity has been reinforced by cultural influences in schools and social groups, particularly in rural areas. Community engagement in anti-corruption initiatives to end or reduce societal acceptance of corruption is thus a critical step in breaking the corruption chain.

Third, community engagement has been very successful over the years in various other sectors. Traditionally, countries have strong cultural bonding, in which relatives, neighbors, and friends share and help each other worked as a force to protect themselves against natural disasters like floods, cyclones, and river erosion. These countries might have the potential for community engagement that could support anti-corruption efforts as well.

Fourth, policies to encourage these community efforts must draw on existing social institutions like the family, educational institutions, and religious institutions, rather than trying to create new bases for community action. These existing social institutions draw our attention to the often-neglected base of Jeremy Pope's "Greek Temple" (Pope 2000). Empowering them will strengthen support for the pillars of the national integrity systems of any country.

## CBOs in Combating Corruption: Early Development

Community engagement in anti-corruption measures, which has gained success worldwide, is an approach borrowed from the well-known US civic education system. This approach continues to be very influential since the nineteenth century. It has been packaged and "sold" to other countries through the Centre for Civic Education's CIVITAS program (Marquette 2007). Similarly, since October 2002, the World Bank Institute's pilot-based Youth for Good Governance Learning Program, which was designed to engage the younger generations, has operated in several countries (Tanzania, Ghana, Uganda, Zambia, Russia, Ukraine, Yugoslavia, and the USA), to highlight the vital role young people can play in improving the quality of governance in their countries (The World Bank Institute 2002).

Additionally, the immense success of the Community Relations Department of Hong Kong's ICAC, which is responsible for the education, publicity, and moral leadership, has also contributed to the spread of community engagement in anti-corruption efforts (Marquette 2007; Quah 1994).

Hong Kong community leaders play an advisory role to the Chief Executive, who is head of the Hong Kong Special Administrative Region (HKSAR) (Huberts et al. 2008). The Citizens Advisory Committee has a crucial role in the content of films, billboards, and other forms of advertising to educate the public on corruption issues (Heilbrunn 2004). Experiences from these initiatives suggest that creating a social movement involving citizens' engagement is one fruitful mechanism for fighting corruption. Furthermore, the World Bank has acknowledged the relationship between anti-corruption measures and citizens (as individuals or as members of civil society) in preventing corruption. Both the UN and the OECD emphasize the broad participation of citizens in decision-making (Verdenicci and Hough 2015). Therefore, the citizens' engagement process through CBOs and other organizational forms motivate donors to promote frequently. Having been developed by following such examples, community-driven anti-corruption initiatives in many countries have become not only widespread but are increasing.

## Types of Community Organizing to Combat Corruption

The brisk development of CBOs to prevent corruption has made various government and non-government agencies to take initiatives. These ingenuities come through many forms which can be categorized as a) government-driven, b) non-government driven, and c) spontaneous community participation.

Government agencies or institutions mainly operate **government-driven** CBOs to prevent corruption through engaging citizens. Following the development of the Community Relations Department of Hong Kong's ICAC, many government agencies are likely to initiate CBO activities to prevent corruption. The United Nations Convention Against Corruption (UNCAC) passed in 2005 also plays a significant role to promote CBO activities through ACAs around the world. Countries, after signing the UNCAC ratification, must initiate preventative activities. Therefore, these agencies, along with local government, ran anti-corruption preventative activities through CBOs. These agencies mainly helped to form CBOs at the municipal, regional, and subregional level. For example, in Bangladesh, the Anti-Corruption Commission (ACC) has a preventative unit to aware and educate citizens about corruption. The ACC also formed the Corruption Prevention Committee (CPC) in every district and subdistrict (local level) to perform their preventative activities with the help of mass people. These committees mainly performed ACC's prescribed program regularly.

**Nongovernment-driven** CBOs are mainly funded and operated by NGOs through donors funding. Intergovernmental organizations (IGOs) like the World Bank, Asian Development Bank, European Union, many international NGOs, and government operate their corruption prevention activities through national and local NGOs. These NGOs mainly worked to fulfill donors' expectation and worked on their prescribed format to prevent corruption. Corruption prevention through NGOs is common and most frequent among these three types. Many NGOs worked together with the local NGOs to form these CBOs to raise their voice against corruption. At the same time, international NGOs also form CBOs through their country office. Among those Transparency International is well known for its CBO activities, forming citizen-led committees in many countries. These committees try to engage and aware citizens against corruption.

**Spontaneous community participation** in combating corruption means preventing corruption without impulse or inclination and premeditation or external stimulus or growing naturally. Generally, spontaneous participation grows naturally and arise suddenly to address problems faced by citizens. The fundamental difference between spontaneous participation and other forms of community action is that the former grow naturally. No one initiates them form outside, sets their rules, or supports them by funding. These initiatives represent a bottom-up approach that develops from self-driven initiatives, self-funding, and creative strategies. These efforts come in different forms in different

circumstances. Perhaps Anna Hazare's protest on the anti-corruption movement is a well-known example of spontaneous participation. Spontaneous participation is result-oriented, and therefore it has a massive risk to become successful.

## Activities and Effectiveness of CBOs to Combat Corruption: Compared

The government and nongovernment CBOs operate an almost similar type of activities to prevent corruption. However, spontaneous participation activities are someway different and known for their unique approach. Both government and nongovernment CBOs activities are more isomorphic and copy each other. They sometimes cooperate and operate joint initiatives to prevent corruption. Government-driven initiatives are mainly limited to preventative activities, for example, discussion meetings, seminars, workshops, public hearing, rallies, community consultation, street, and drama throughout the year. Their approach is more creating awareness and educating citizens to prevent corruption. Nongovernment initiatives also follow a similar method. Additionally, they also organize advocacy program and occasionally worked as a bridge between service holder and service receiver. Despite that, Carr and Outhwaite (2011) found that people in nongovernment community activities often focus on information-sharing, networking, and communicating in a restricted sense (Table 1).

Spontaneous participation in CBOs is more likely to be problem-driven and more productive from other forms of CBOs activities. Spontaneous participation activities depend on the nature of the problem. For example, Anna Hazare made a hunger strike for passing Lokpal Bill in India, an old farmer in Bangladesh moved around the entire village to make a protest against the local land office. It may come as an individual, organizational, or a combination but always looks for a solution. It also organizes formal program such as discussion meetings, seminars, workshops, rallies, community consultation, and street drama in a limited number depending on the situation.

All types of CBOs are successful in corruption prevention through various mechanisms. Many countries have succeeded in preventing corruption through CBOs. However, different forms of community organizing have a different level of success. However, donor-assisted program (government and nongovernment), in most cases, do not or have less success (Andrews 2013). In the developing countries government and nongovernment approaches to engaging citizens generated by donor funding have minimal impact on combating corruption. Although these initiatives have official legitimacy and robust constitutional frameworks, they remain less effective. Compared with bottom-up approaches, they lack urgency, intensity, and commitment, with most of the officials serving to fulfill key performance indicators. They measure success by numbers rather than real impact in

**Role of Community-Based Organization to Combat Corruption, Table 1** Summary comparison of three types of community engagement

| | Government | Nongovernment | Spontaneous |
|---|---|---|---|
| **Funding** | Government/donors | NGOs from the donor funding | Self/some income-generating activities |
| **Official legitimacy** | Yes | Yes | No |
| **Clear strategy** | Prescribed format: coercive, mimetic, and normative isomorphism | Prescribed format: both coercive, mimetic, and normative isomorphism in practice fulfilling KPIs | Problem-driven initiatives |
| **Code of conduct** | Yes | Yes | No |
| **Activities** | Awareness campaigns, mobilizing people, advocacy. Information fairs, etc. | Awareness campaigns, mobilizing people, advocacy. Information fairs, etc. | The direct protest, movement, organized people to get a result immediately. |

Source: Author

society. Therefore, many researchers prefer bottom-up anti-corruption efforts to prevent corruption. For example, Andrews (2013) emphasizes a problem-driven learning approach to gain state capability. He suggests that donor-assisted program might stick the states in a position where they could not implement any policy. He contextualizes this situation as isomorphic mimicry. Therefore, donor-supported isomorphic mimicry took countries nowhere, and they fall in capability trap. He further emphasized that developing countries should give priority to the local context. Andrews et al. (2013) have suggested a "Problem Driven Iterative Adaptation" (PDIA) model escape capability trap. Instead of the application of "best practice," PDIA encourages viable and relevant interventions based on specific problems.

For example, citizens' participation through a bottom-up approach has achieved some outstanding results in several countries. In the case of India, Webb (2012) showed that poor people in Delhi obtained services from public institutions through a collective approach and the use of the *Right to Information Act 2005*. Similarly, leading examples of community organizing and citizens' engagement are Residents' Committees in Singapore, Neighbourhood Associations in Japan (Read and Pekkanen 2009), and Civic Organisations in Indonesia (Achwan and Ganie-Rochman 2009). In other research based on 60 case studies, Goetz and Gaventa (2001) found that citizens' engagement and civil society initiatives have fostered public services; participatory budget monitoring in Brazil (Touchton and Wampler 2014), social audit hearings in India (Pande 2014) are some other successful cases of preventing corruption through bottom-up community-led efforts. These initiatives not only encourage local development but also reduce opportunities for corruption by engaging citizens in the process.

## Challenges of CBOs in Combating Corruption

Translating this consensus into the formation of effective CBOs to combat corruption is, however, far from easy. The experiences of forming such oversight bodies in the local government sector are not promising. According to one case study, community participation in the local governance process has been an "inchoate and piecemeal affair" due to political manipulation, clientelism, inadequate governance structure, and the need for greater awareness and participation (Waheduzzaman and As-Saber 2015). Therefore, CBOs worldwide face someway few similar challenges like these:

**First,** since political interference is a crucial problem in other civic organizations, there is a strong possibility that the same thing could occur in CBOs. The main dangers here are the development of patron-client linkages between CBO members and influential political figures. At the same time, it is impossible to succeed and create an anti-corruption framework without the support of the party in power, and many CBOs in other countries do develop productive connections with political parties.

**Second,** the donor's driven approach, as well as a spontaneous participation, needs uninterrupted funding to remain active. The survival of the CBOs depends on managing the stream of supplies, autonomy, and external groups. The concentration and provided resource importance increase the dependencies. Thus the organization faces more significant constraining influences from their environment if they depend heavily on one or very few resource providers (Verbruggen et al. 2011). Even if some types of movement arise due to self-driven and self-funded initiatives, they often need stable sources of funding to make them successful in the longer term.

**Third,** initiatives like anti-corruption movements need strong leadership capabilities. It is often hard to find people who are brave and have leadership capabilities. Some leaders are challenging to replace, and leadership transitions are often complicated. Some CBO activities often face challenges of fear of physical or mental threats. People who are engaged in anti-corruption movements have received threats to their lives by powerful forces.

**Fourth,** the experience of engaging citizens in various committees is often hampered by the presence of local patrons, syndicates, and clients, who create conflicts, suspicion, and even corruption within groups. Group members who are solely committed to the anti-corruption cause and not joining for ulterior motives are a significant challenge.

**Fifth,** CBOs often require support from different stakeholders, which is sometimes lacking in many countries. There are problems within the CBOs forming committees and personal interest. Even, they may not get proper support from the government and agencies.

**Finally,** volunteerism needs extended time, and when it comes to anti-corruption, the task is much difficult. CBO members (especially the leaders) are most often busy with their other responsibilities. Therefore, CBOs in many countries failed to engage people in the movement with real passion.

## Conclusion

The role of CBOs in combating corruption is challenging but not impossible. All forms of CBOs might have more success if they overcome the known challenges. Evidence suggests that political will can enforce CBOs in anti-corruption as it creates an environment for reforms and policy implementation (Brinkerhoff 2000).

# Role of Corporations in Addressing Climate Change

Haris Alibašić
Public Administration Program, College of Education and Professional Studies, University of West Florida, Pensacola, FL, USA

## Synonyms

Climate change; Climate resilience; Leadership; Management; Sustainability

## Definition

Corporate role in addressing climate change threats and climate resilience is a result of several direct and indirect factors, including but not limited to the economic and financial interests, risk management, branding, and ethical responsibility and responsiveness to the societal demands and global changes.

## Introduction: Climate Change and Corporate World

Climate change is a proven scientific fact, documented through thousands of peer-reviewed, meticulously compiled studies and reports, indicating threats to the world (Fletcher 2013; IPCC 2014; Urban 2015). Climate change is a threat to the global economy and the current way of life, with a potential to affect all facets of life, from social to the economic fabrics of the global society. Businesses as a core component of the social fabric, and businesswomen and businessmen play an integral role in being engaged on issues potentially impacting their corporate bottom lines. While a smaller number of corporations are significant contributors to global warming and GHG emissions, companies in effect contribute to pollution, which leads to global warming and the ensuing climate change impact (Griffin 2017; Riley 2017; Starr 2016).

However, companies are actively engaged in pursuing actions to stem the negative impact of climate change and threats from extreme weather-related events, in knowing the risk of failed cities, communities, and ultimately infrastructure on their operations. The consequences for corporations may include supply change and transportation disruptions, higher insurance premiums for doing business in certain parts of the world, the negative impact on human resources, and changes in energy supply. Each industry sector from tourism to logistics will be negatively and adversely affected. Linnenluecke and Griffiths (2010) documented the risks of climate change and extreme weather events to business organizations and suggested the strategies for dealing with those beyond traditional adaptation approaches.

Corporations may be able to quickly adjust and seek opportunities for long-term solutions through adaptive strategies tied directly or indirectly to climate change risks and mitigation. On a large scale, problems facing corporations and cities are related to the opportunities and woes that exist with the global economy. The interconnectedness between the global interests that corporate leaders have in ensuring profit for their organizations and social and environmental responsibilities was entirely on display after the current United States administration's decision to withdraw from Paris Climate Accord (Bendix 2017; McGregor 2017; Victor 2017; We're Still In, 2017).

## History of Corporate Societal Responsibility

The idea of climate resilience is relatively new. However, the concepts of corporate social responsibility and sustainability have been in existence for over several decades. In a classic work, Schumacher (1973/2010) addressed the treatment of resources in the world in the context of economics, accurately predicting the unsustainability of using finite resources by industrial society, suggesting and asking "whether the earth's resources are likely to be adequate for the further development of an industrial system that consumes so much and accomplishes so little" (p. 127).

Building on the United Nations World Commission on Environment and Development's (1987) sustainable development framework, Elkington (1997) defined the Triple Bottom Line (TBL) setting up a new paradigm for viewing business activities beyond the profit-making bottom line. Later Elkington (2012) wrote about the new boundaries deployed by innovators and entrepreneurs in seeking to discover ways to have zero impact from organizational actions on the environment and the society, and pushing organizations to break the new "sustainability barrier." Moreover, in making the business case for sustainability for companies and corporations, Werbach (2009) noted "the global economy, our environment and political institutions are undergoing rapid structural change" (188).

## Root Cause of Environmental Instability

A primary type of energy is derived from fossil fuels (oil and coal), causing the existence of price unpredictability and most directly contributing to climate change on an unfrequented scale. The abundance of traditional sources of energy, such as coal and oil, led to the dependency of use of those sources of energy. Oil, coal, and to a certain extent natural gas have been the primary drivers of electricity production and energy consumption in the modern world, and one of the most prominent polluting elements in the history of humankind. Additional pressure to all systems will come from the inevitability of climate change in a way that will impact entire energy systems. The era of climate change brings a set of challenges and responsibilities beyond the traditional way of doing business. Consequences of this new era of climate are unpredictable, and unpredictability carries a certain amount of risk for which every organization and systems could either prepare or ignore it at its peril.

### Ethical Prerogative for Corporate Societal Responsibility

Corporations with strong ethical missions embed the policies to promote sustainability and resilience despite changes in stakeholders and managerial leadership. With such prerogative, Williams (2011) and Bohmholdt (2014) explained the Sustainable Return on Investment (SROI) and benefits of calculating the bottom line for companies' sake beyond the profit-making. For corporations professing sustainability and climate resilience as their core values, incorporating these tools becomes a norm, using for example environmental and social cost of fossil fuels in calculating the overall return on investment from sustainable energy projects.

Corporations reap social benefits of protecting the environment, practicing good social values, while managing fiscal and economic development expectations. Saul (2011), for example, focused attention to turning social change into a business strategy. There are arguments that organizations, mainly corporations, use the sustainability bottom line to break ranks with the accepted views of businesses and to advocate for societal issues such as climate change and protection of the environment. With the new climate resilience barrier, new strategies are being deployed. Bendell and Kearnis (2005) shared examples of companies using their economic and business clout to pursue political agenda and to advocate for various sustainability-related issues including the climate change impacting businesses and the rest of the society.

### Social Entrepreneurship

In addition to the political dimension of the corporate social responsibility and business sustainability efforts, an aspect of corporate role in addressing climate change is expressed through the concept of social entrepreneurship, covered at length by Bornstein (2004), Bravo (2016), and Doherty et al. (2014). A notable shift and change is the trend of corporations and organizations moving from the profit-only paradigm and investing more in socially and environmentally sustainable effort. Sustainability is a driving force behind the underlining paradigm, dictating more responsive and responsible governance and management of resources. Soyka (2012) viewed sustainability as "a value set, philosophy, and approach" used by organizations for the "the betterment of society" (p. 17). Corporations adapting to the changing needs of the societies find themselves to be more financially and economically successful, and socially responsive. Furthermore, those corporations are better equipped to respond to crises and recover from shocks.

## Strategies to Mitigate the Greenhouse Gas Emissions by Corporations

Corporations operate in a dynamic and a highly competitive global marketplace, and are unpredictability associated with business cycles and market fluctuations. To compete more forcefully in the global marketplace companies must steadily reduce and mitigate risks and exposure to risk. Both the increased globalization and climate change exponentially raise the exposure to various risks and measureable impacts on corporate operations, in what O'Brien and Leichenko (2000) described as double exposure. Some examples of strategies deployed by corporations to reduce the impact of Green House Gas emissions include the purchase and production of renewable energy, with specific renewable energy and energy efficiency targets. In the United States alone, the EPA's list of Fortune 500 partners shows that 82 corporations committed to deploying renewable energy sources in their operations use approximately 21 billion kilowatt-hours (kWh) of renewables annually, with a significant reduction in the negative environmental footprint from energy use (EPA 2017). Similar to local governments and their commitment to reducing GHG emissions in operations, corporations need to measure and report the overall results of their commitment to reducing the use of traditional sources of energy in operations.

Other popular approaches and strategies increasingly used by businesses to reduce the negative impact of waste on the environment are the concepts of Cradle to Grave (C2G) and Cradle to Cradle (C2C) concepts. The intent is to view products through the lens of either producing less waste or designing products that can be re-entered into the market through recycling processes. In addition to positive branding from selling products made with less waste or from recycled materials, both processes have a positive impact on the environment and reduce the cost of operations. To better understand the impacts of a product from the time of initial production through the end of the lifecycle, corporations can reduce the negative environmental impact from resources use, educate and encourage consumers how to treat and dispose of the product, and make their operations more resilient to changes.

## Conclusion

Corporations have a role and responsibility to their customers, stakeholders, employees, and the society as a whole to deal with the threats of the changing climate and extreme weather. As a result of several direct and indirect factors, including but not limited to the economic and financial interests, risk management, branding, and ethical responsibility and responsiveness to the societal demands and global changes, corporations deploy strategies to mitigate and adapt to the climate change. The scope of corporate social responsibilities continually evolves, reflecting the changing needs and interests of the society and communities where businesses operate. Beyond the financial interest in mitigating risks of climate change, and reducing the negative environmental impacts, businesses are interested in increasing

positive image of the company's products and services brands they produce and provide.

# Role of Superpowers in Conflict Development and Resolutions, The

Mario Coccia
CNR – National Research Council of Italy, Torino, Italy

## Synonyms

Empire; Global leadership; Great power; Imperialism; Resolution; Conflict; War

## Definition

Superpowers are nations with a high economic-war potential and social power, recognized worldwide, that influence other geoeconomic regions. Superpowers have a purpose to achieve/sustain a global leadership, and their role in conflict development and resolution is directed to cope with environmental threats or to take advantage of important opportunities in markets.

## Introduction

Superpowers or great powers or leader countries (these terms can be used here in an interchangeable manner) have a high economic-war potential based on an economic, scientific, and technological superiority recognized worldwide (cf., Coccia 2012, 2015a, 2017). Stein and Russett (1980) argue that the strength of superpowers is due to a superior "military sophistication" that can support the final victory in wars. The role of superpowers is also associated with conflict development and resolution (the latter concept "means to employ behaviour used in similar situations, adapted if necessary, so as to obtain an outcome that is good enough," as quoted by Ackoff and Rovin 2003, p. 9). In fact, superpowers can develop conflicts to take advantage of important opportunities or to cope with consequential environmental threats. International conflicts guided by superpowers influence negatively and/or positively some economic processes in a permanent way. Conflicts developed by superpowers can stimulate long-run technical and organizational progress of countries (Coccia 2010a; Coccia and Bellitto 2018). Some social scientists have given more attention to the effects of wars, driven by superpowers, on technology social and economic growth (cf., Ruttan 2006; Coccia 2015a, 2018). As a matter of fact, conflict development by superpowers can support both technological innovations and other types of innovations (Coccia 2015a, 2015c, 2016a, 2016b). For instance, income tax, an innovative fiscal model, is originated in England during Napoleonic Wars for restructuring the finance of government for military requirements (cf., Gini 1921, p. 205). In general, conflicts between superpowers generate major socioeconomic consequences and structural change at national and global level (Stein and Russett 1980, p. 401). Superpowers influence profoundly socioeconomic and political systems worldwide and with conflict development and/or resolutions can generate economic shocks for participants and neutral nations (Goldstein 2003, p. 215). In particular, conflict development by superpowers generates demand-side and supply-side effects for domestic economy and for economies of allied countries. The demand-side effects of conflicts are a huge demand shock based on a massive increase in deficit spending and expansionary policy for economic system. The demand effects, generated by conflicts, are coupled to powerful supply-side effects: learning by doing in military production, spin-off and spillover from military R&D, etc. These effects of military conflicts support output, productivity, and technological growth of superpowers and interrelated economies (cf., Ruttan 2006; Coccia 2012). For instance, US manufacturing sectors have taken advantage of fruitful demand-side and supply-side effects of World Wars. In short, superpowers, generating conflicts, support R&D investments to produce military technologies that are transferred to civilian applications in the long term (Coccia 2008b, 2015a, 2019a). The mobilization of human and economic resources by superpowers, during conflict development, increases inventions

and technological innovations that in the postwar period are diffused in society to induce long-run economic growth (Stein and Russett 1980, p. 412; Coccia 2015a).

Conflict development and/or conflict resolution also play a vital role in the distribution of power within international system (cf., Levy 2011). As a matter of fact, the effect of wars between superpowers can fundamentally change the hierarchy of power among nations in the international system. Modelski (2010) asserts that the "war causes the Great Powers," such as Roman Empire over 200 BCE ~ 400 AD, Britain Empire in the 1710–1850 period, the USA from 1940s onwards, etc. (cf., Stein and Russett 1980).

Kindleberger (1989, p. 203) argues that:

> The Thirty Years war from 1618 to 1648, culminating in the economic dominance of the Netherlands, from French revolutionary and Napoleonic wars from 1792 to 1815, ending in the Great Britain at the apex of the world economy, and the combined World Wars I and II, from 1914 to 1945 that led to the United States taking over as the world's leading economic power

Several nations have lost their status of superpower or imperial leadership because of conflicts (e.g., Austria-Hungary in 1918, Italy in 1944, Germany and Japan in 1945; cf., Stein and Russett 1980). Major conflicts between superpowers produce a change in the global leadership of the world economy and generate "hegemonic cycles," which are longer than 150 years (Kindleberger 1989, p. 203ff; cf., Kennedy 1987; Coccia 2018). Hence, superpowers, winning international conflicts, can achieve and/or sustain a global leadership in world economy (Coccia 2015a, p. 203).

Linstone (2007, p. 115) states that: "the winner in each case became the leading global power, a new global political economy emerged, and democracy advanced" (cf., Devezas 2006). In this context, superpowers are: "large-scale political organizations that might usefully be studied as complex systems. But they are also products of their age, and must be examined in the context of their time and place" (Modelski 2010, p. 1418).

Modelski (2010, p. 1419) also argues that:

> Empires are not the only form of large-scale political organization. . .. two other forms, global leadership (other terms used for it include hegemony – Greek for leadership – and global primacy), and . . . global organization. . .. (Britain) is a case of global leadership that toward the close of its trajectory exhibited imperial features. The United States, too, in relation to the world system, is an instance of global leadership. And global leadership can be seen as a transitional form evolving in the direction of enhanced global organization.

Ferguson (2010) notes that after the World War II, the USA assumes a global leadership, replacing the UK and "shifting from an informal to a formal empire much as late Victorian Britain once did" (as quoted by Modelski 2010, p. 1419). Ferguson (2010) also claims that the USA is similar to an empire with a military, political, economic, and technological leadership recognized worldwide. Modelski (2010, pp. 1419–1420, original emphasis), by contrast, argues that the USA is a superpower with a network-based structure, which is oriented to long-distance trade in the world system: "inclining at times to the temptations of 'informal empire' but in its basically non-imperial organization capable of responding flexibly to international crises. . .. its proper name is global leadership, an evolutionary, and therefore transitional form capable of adaptation and self-transformation in response to mounting global problems." Finally, imperial aspirations of nations, with conflict development, are impracticable in current world, which is increasingly global, complex, turbulent, interconnected, and multilevel; the only feasible strategy of superpowers, which develop conflicts, is to achieve/support a global leadership in the world economy that is subsequently sustained with R&D investment directed to economic and technological performances higher than other competitive nations (cf., Modelski 2010, p. 1419ff; Coccia 2008a, 2011, 2012, 2018a).

## Superpowers, Conflict Development, and Human Progress

In general, the conflict development by superpowers has several negative effects, but it also seems to have a crucial connection with the progress in society. The conflict development

between superpowers drives strategic investments in science and technology to solve relevant problems and/or win wars directed to achieve/support a global leadership (Coccia 2010, 2011, 2014, 2015a, b). Stein and Russett (1980) argue that conflict is one of the engines that propels economic change and supports technical progress in society. The conflict development by superpowers appears to be a necessary phase for human development, which is not a monotonous and linear but rather a disequilibrium process of world system (cf., Gini 1921). The conflict development by superpowers can be also due to prove military and scientific superiority toward other belligerent nations (cf. also, Coccia and Wang 2016). At the same time, conflict development by superpowers stimulates new technology and innovation that, after conflict, can be spread in many economic sectors (Coccia 2008b, 2015a). In fact, superpowers, under environmental tensions and consequential environmental threats (e.g., potential conflicts), have the incentive to exploit, particularly, the newest and less known discoveries and inventions in science and technology to support their leadership (cf., Gini 1921; Coccia 2015a). Moreover, superpowers invest in science and technology to reinforce socioeconomic power in the international system. In fact, in turbulent environment with political tensions, a superpower invests in science and technology to set its high-tech arms at a level that it knows will be sufficient to deter the other competitor superpower. The other competitor superpower must then also invest in R&D to set its arms at a similar level to deter future attacks when the first superpower sends signals of threats. A complete lack of R&D investments, associated with high-tech arms, is not a stable equilibrium between superpowers in competitive contexts, since a superpower that does not anticipate the strategies of others will be completely unprotected to cope with environmental threats and to take advantage of important opportunities; for this reason, superpowers invest in R&D to have new technology and high-tech weapons to cope with environmental threats, be prepared to conflict development, and/or for increasing the reputation as a deterrence strategy in competitive socioeconomic and political contexts. Hence, the technological progress seems to be associated with socioeconomic shocks (e.g., international conflicts) governed by superpowers, which generate long-run structural and social change on wide geoeconomic regions (Coccia 2014a, 2015a, 2019c).

Technological and social change would be vastly different, and economic development in society would be substantially delayed, without strategic (military and defense-related) investments that are triggered with conflict development and resolution between superpowers to achieve/sustain a global leadership. In fact, relevant needs and strategic problems during wars between superpowers are a strong incentive for generating new technology directed to win wars and subsequently support commercial and political leadership in markets and society (Fig. 1).

Hence, superpowers have the purpose of global leadership and in the presence of (effective or potential) environmental threats (e.g., conflicts) generate inventions and new technology for winning wars and subsequently support in a peace period the paths of economic and social development in markets (Coccia 2015a, 2017, 2018).

Overall, then, superpowers, generating conflicts, tend to be a vital driving force of social, technical, and economic change that supports human development in society (Coccia 2010b, 2015a; Coccia and Bellitto 2018).

## Conclusion

Superpowers guide the development and resolution of international conflicts generating social and economic change with effects on individuals, groups, nations, societies, and international systems (Stein and Russett 1980). In fact, Coccia (2015a) shows that long-term evolution in society, based on technical and social change, is a process of disequilibrium trigged with conflicts governed by superpowers having the goal of achieving/sustaining a global leadership (cf., Coccia 2018). Moreover, in a context of world system,

**Role of Superpowers in Conflict Development and Resolutions, The, Fig. 1** Role of superpowers in conflict development and resolution for achieving and sustaining a global leadership

superpowers generate a power hierarchy between core and periphery regions, in which powerful and wealthy core nations dominate and exploit weak peripheral areas. In particular, the role of superpowers is driven by dominant capitalist classes that want state protection for their control of international trade, to take advantage of important opportunities and to maximize profit of firms (cf., Coccia 2019b).

An economic boundary of superpower, in the presence of conflicts and environmental threats, is the high level of public expenditures (cf. also, Coccia 2013, 2017a). In fact, the high military expenses of superpowers can increase public debt and create social issues and possible economic shocks (cf., Ferguson 2010; Coccia 2013, 2017a). Kennedy (1987, pp. 539–540) argues:

> To be a great power—by definition, as a state capable of holding its own against any other nation—demands a flourishing economic base. . .Yet by going to war, or by devoting a large share of the nation's "manufacturing power" to expenditures upon "unproductive" armaments, one runs the risk of eroding the national economic base. . ..maintaining at growing cost the military obligations they had assumed in a previous period.

Moreover, superpowers may assume a worldwide role close to autocracy in order to sustain their global leadership with a strategic behavior directed to a permanent "wartime" and strains in different geoeconomic regions (Linstone 2007, p. 237). Anyhow, superpowers can also act as a world-wide guardian for conflict resolution and for reducing sociopolitical tensions across nations to support geopolitical equilibria and worldwide stability. Davis et al. (2012, p. 8) argue that: "The United States has an interest in dissuading military competition wherever it might arise. . .. U.S. forward military presence displaying U.S. conventional superiority."

Overall, then, superpowers have a purpose to achieve/sustain global leadership, and their role in conflict development and resolution is directed to cope with consequential environmental threats or to take advantage of important opportunities worldwide to support a global leadership and/or reinforce the position in the international system and markets. This role of superpowers, oriented to global leadership, tends to generate economic, technological, and social change and, as a consequence, human development in the long run.

# Role of the Public Sector in Corporate Social Responsibility, The

Glen M. Vogel
Legal Studies in Business, Frank G. Zarb School of Business, Hofstra University, Hempstead, NY, USA

## Synonyms

Corporate accountability; Corporate responsibility; Creating Shared value (CSV); CSR; Social responsibility; Sustainability; Sustainable development

## Definition

Corporate social responsibility is more than just philanthropic activities; rather, it changes the way a business operates in such a way as to maximize the company's ability to both benefit society and allow the company to remain focused on sustaining and growing the business and its value. In the public sector however, CSR appears in two forms: both the public sector entity engaging in socially responsible behavior itself and setting policies and enforcement mechanisms to assist private sector businesses to do the same.

## Introduction

When presented with the term corporate social responsibility (CSR), most people presume that the term refers to the activities of a private sector company that relate to its social and environmental impact Jarret (2015). That could be the result of the fact that there is very little governmental regulation in the United States on the subject of CSR Cedillo, Torres (2012). Instead, it is based largely on a principles-based approach to ethics, along with corporate codes of conduct that set forth the requisite values and principles, which both the members of the company and the company itself aspire to follow. The business sector has become more focused on CSR because, in today's economy, most consumers and social advocates support the concept that businesses should not only be profitable but that they should also be mindful of the social implications of their activities Langlois (1990).

Basically, CSR can be summarized as falling into three categories: people, planet, and profits. That means that a business, from a CSR perspective, can be judged on how it treats its employees, how it impacts the environment, and how successful it is for its investors. In the past several decades, there has been an increase in the expectation that companies will implement CSR practices that encourage business activities that minimize the negative environmental and/or social impact while simultaneously maximizing

economic gains. As a result, corporate America has implemented CSR policies that affect virtually every facet of their operation, such as governance and ethics, employment practices, professional development of employees, ethical and responsible activities in the chain of production, and the organization's overall environmental and social impact Jarret (2015).

At its heart, corporate social responsibility is about accountability. How the relevant parties are held accountable, however, can differ when the entity at issue is not a private business but rather it is part of the public sector. That is because in "the private sector the board of directors represents the instrument through which managements of companies are accountable to the stakeholders of those companies" (Barac 2016). Conversely, in the public administration scenario, where public officials employed by various levels of government both implement and execute the CSR policies, accountability rests at various governmental levels. Since public money and the public trust are at stake, both state and federal legislatures typically establish more stringent accountability mechanisms.

## Public Sector Entities and CSR

While all public entities exist to provide a service to the public or communities, they have a complexity and variety of functions and are responsible to different sets of stakeholders. As such, unlike private organizations, public sector entities do not operate within a common legislative framework and their sizes and shapes differ. It is therefore not possible to develop one set of recommendations for corporate governance that will be applicable to all public sector entities (Barac 2016). The very nature of public service reflects many principles of social responsibility – accountability, transparency, and respect for differing stakeholder's interests. Thus, it is imperative that public sector organizations focus on three principals of corporate governance:

- Openness: This principal will help ensure that the public has confidence in the decision-making processes and in the management of both the individuals and the activities they engage in.
- Integrity: Supporting honesty and objectivity, particularly with respect to the management of public funds and other resources. In addition, ensuring the effectiveness of the CSR controls and the professionalism and standards of conduct for all individuals within the organization.
- Accountability: By making sure that both individuals and the entity itself are responsible for their actions and are willing to submit themselves to an external review, particularly with regard to the stewardship of public funds and resources.

The public sector also has a leadership role to play, and one of its functions is to ensure that its own way of operating is in line with good CSR practices in its role as employer and service provider and in its engagement with communities (CSR Hub 2016). The public sector also has various regulatory roles that are relevant to CSR. Once legislative and regulatory frameworks are in place, the government has the continuing role of monitoring their implementation, ensuring that breaches are dealt with properly, and offering opportunities for redress for those who are impacted when the statutory requirements are not complied with (CSR Hub 2016).

## Public Sector's Role in Improving Private Sector CSR

The public sector's creation of a regulatory framework and their subsequent enforcement capacity is critically important to providing the motivation for private sector CSR (Ward 2004). The public sector is in the unique position to set the overall policy and regulations within which most businesses operate. Thus, in order for "businesses to continue to improve their social and environmental performance, the public sector needs to provide two key contributions: (1) clarity in its regulations; that is, the baseline standards it requires of all firms, and (2) predictability of governmental intervention" (Ward 2004). Recent scholarly reviews of public sector activities have revealed

that there are essentially four key public sector roles for CSR. These are mandating, facilitating, partnering, and endorsing Fox (2002). Even though there may be some overlap of coverage across these four areas, they have the distinct advantage of simplicity as well as neutrality with respect to their application to a particular CSR agenda.

**Mandating**: In their mandating role, the various levels of government must establish a legal framework that defines the minimum standards for business performance. This framework would provide both enforcement and punitive capabilities. These standards would cover subjects such as emissions into the air, land, and waterways and requirements that leadership considers specific factors into account when making business decisions. There are other areas as well, but equally important, in this role, the government can also drive innovation and the migration toward best practices and how these practices will change as technology and environmental standards evolve.

**Facilitating**: Governmental bodies enable or provide incentives to companies to implement and support a CSR agenda. Here, incentives such as tax deductions or penalties, passing CSR-specific legislation, and access to funding for research and innovation are all tools that the government can use to facilitate a company's implementation and compliance with a CSR policy. They can also support and fund activities such as training, information collection and analysis, and awards or recognition for CSR achievement.

**Partnering**: An advantage to creating partnerships is that larger societal or environmental issues can be addressed as a result of the opportunity to leverage the skills and strengths as part of a joint effort between the public sector, private companies, and society as a whole. Sometimes financial or regulatory roadblocks prevent CSR practices and activities that can otherwise be accomplished through strategic partnerships between the preceding parties.

**Endorsing**: Political support and public sector endorsement of CSR and its related activities and programs is the fourth key role for the public sector. This can be in the form of publishing policy documents, setting forth public sector management practices, and directly recognizing CSR achievements through awards and mentions in speeches, especially in situations where an entity goes further than the minimum environmental and social standards.

As previously noted, there is rarely a definitive line separating these four key roles; rather, there may be situations where the government acts as a partner with a private sector organization with the proviso that the success, or lack thereof, of the partnership could result in specific legislation or regulation.

Along with the four key roles, there are numerous themes for a CSR agenda that are relevant to identifying the public sector's role. Some of these are Fox (2002):

- Public Policy Role of Business: Examples include legislation that limits the political involvement of business entities (Campaign Finance Reform) and regulations that relate to private employment practices and ownership (Affirmative Action).
- Corporate Governance: Financial disclosure requirements (Sarbanes-Oxley).
- Responsible Investment: Prohibiting entities from investing in risky enterprises or in accounts that may have origins in unfriendly nations (i.e., pension funds).
- Philanthropy and Community Development: Providing tax incentives for voluntary corporate donations or social investment.
- Pro-CSR Production and Consumption: promotion of green products and processes and/or sustainably produced goods and services (i.e., polluter pays policies and consumption penalties).
- Pro-CSR Reporting and Transparency, "Beyond Compliance" Standards, and Management Systems: encouraging entities to report on nonfinancial environmental and social activities to demonstrate superior CSR practices Fox (2002).

## Federal Sentencing Guidelines

In April of 2010, the United States Sentencing Commission modified the Federal Sentencing

Guidelines, including the provisions that set forth the attributes of effective compliance and ethics programs. These guidelines are used by federal prosecutors and regulators when evaluating whether an organization or public sector entity should be charged with a crime as well as the severity of the penalty (Complaince360). These guidelines are not applied solely to the private sector because, under the Federal Sentencing Guidelines, governments and political subdivisions are also subject to its provisions (section 8A1.1, section 1, Applicability of chapter 8). It makes sense for the public sector to consider these attributes when developing a CSR policy since satisfying section 8 of the Federal Sentencing Guidelines can result in the reduction of fines, a reduced sentence, and even a deferred prosecution.

In order for an entity, public or private, to avail itself of the above sentencing advantages, that entity is going to have to demonstrate that its CSR policy and practices are part of a written code of conduct that enables auditing and other procedures such that together they are reasonably capable of both preventing and detecting wrongdoing as well as reducing the likelihood of misconduct (Complaince360). In addition, an entity should be able to show that its compliance and ethics programs involve multiple layers of management so as to ensure the effective oversight of the programs. The Federal Sentencing Guidelines also set forth expectations with respect to the duties that will be imposed on the specific levels of management and individuals that are assumed to have primary responsibility for the compliance and ethics programs. Furthermore, since many organizations today are increasingly reliant on outside parties to manage an array of functions, those same organizations should ensure that proper safeguards are in place to avoid delegating important functions to individuals or companies with a history of engaging in illegal or unethical behavior or any other conduct that does not comport with the standards and expectations of the entity's compliance and ethics programs. Not only must entities be aware of the practices of the parties to whom they outsource tasks, but they must also take reasonable steps to communicate the compliance and ethics expectations and standards to the members of their own organization. At every level, including senior management and the board of directors, members must be periodically educated and reminded of the standards. Because laws and regulations are constantly changing, entities should also ensure that their standards and expectations are also periodically reviewed and their effectiveness audited. Last, it is understood that having compliance and ethics programs is all well and good, but unless an entity can demonstrate that it not only promotes the value and importance of those programs but that it also disciplines those who fail to adhere to these policies, then having the policies themselves is largely ineffective.

## Conclusion

There are lots of opportunities for the public sector to help shape the CSR agenda. Public sector agencies can address concerns about climate issues, eradication of corruption, respect for the fundamental civil rights of all citizens, security in investments, sustainability, as well as other areas of national or local interest or concern. These same entities can also identify priorities and offer incentives that are meaningful and that will bring awareness to contemporary CSR issues. Finally, public sector entities can partner with the private sector or other organizations to achieve public policy goals.

# Romance of Leadership

Michelle C. Bligh
Division of Behavioral and Organizational Sciences, Claremont Graduate University, Claremont, CA, USA

## Introduction

As individuals, as organizations, and as societies, we are fascinated with leaders and enamored with leadership. In essence, we love to glorify or romanticize all things associated with leaders, often at the expense of followers and the situation or context. The romance of leadership (ROL) theory argues that it is often much easier to believe in leadership than to prove it and explores when, why, and which of us are more susceptible to falling under the "spell" of leadership. At its core, the ROL is an attributional approach to leadership that suggests we overweight the causal role of leaders in influencing and changing our institutions and societies. Ultimately, when organizations and sports teams do well, or perform very poorly, we tend to look to leadership as the most salient explanation for these outcomes. In fact, organizational performance is in reality a complex interplay of a wide variety of complex, temporal, and interrelated factors, not to mention follower contributions. However, as first introduced by leadership scholar James R. Meindl and colleagues (Meindl et al. 1985), Meindl's empirical research demonstrated that leaders and leadership issues are most often the favored explanations for both positive and negative outcomes in organizations. Moreover, more recent findings demonstrate that we also tend to value performance outcomes more highly when those results are attributed to leadership, a phenomenon that both leaders and media outlets may purposefully exploit. In addition, a halo effect exists for leadership: if an individual is perceived to be an effective leader, as followers we are much more likely to overlook the leader's personal shortcomings, poor performance, and even ethical transgressions.

As a theoretical approach, the romance of leadership asks us to question our collective obsession with leadership and also asks us to question why leadership is such a compelling phenomenon. It suggests that we tend to strongly favor leaders and leadership as the causal force behind the activities and outcomes of organizations, in part because it lessens our feelings of uncertainty in an increasingly uncertain world. As such, the romance of leadership perspective is an explicitly critical response to a prevailing emphasis on the importance of *leaders* in the leadership process (as opposed to an emphasis on followers or the situation) or what Meindl labeled as the "unbalanced equation" of leadership (see Meindl 1990, 1995). Meindl argued that whatever the true impact of leaders and leadership in organizations and societies, the concept of leadership garners an immense – and therefore overweighted and unbalanced – influence in our understanding of the world. Dating back to the early writings of Max

Weber in the first half of the twentieth century, Meindl highlighted that despite centuries of discussion and a century of formal research and writing, the concept of leadership is still somewhat "magical." In essence, the true nature and impact of leadership has remained largely elusive and has proven remarkably resistant to attempts to unravel its mystique. Yet despite this resistance, as individuals and as societies, we continue to faithfully believe that leadership is important in its own right, even in situations where we have no direct evidence to sustain this belief.

It is also important to note that the romance of leadership perspective was one of the first explicitly *follower*-centric approaches to leadership (see Shamir et al. 2007). In his emphasis on the importance of balancing the many *leader*-centric approaches that continue to dominate modern leadership research and practice, Meindl suggested that we need to reverse the lens and consider what it is about followers that sustain their need to believe in a heroic leader and the efficacy of leadership. Skeptical of the overly heroic, larger than life status that leaders had attained in an age of celebrity CEOs and politicians who acted seemingly above the laws, Meindl urged us to consider the implications of questioning the underlying assumption that leadership is inherently important in its own right. In essence, he urged us to enhance our appreciation of external factors and the complexity of ambiguous and uncertain circumstances in which organizations operate and pointed out that we need to explicitly question and empirically examine the significance of leadership in modern organizations.

In sum, the romance of leadership theory highlights that when we discuss leadership, we often invoke positive, efficacious, and even romanticized qualities such as status, esteem, prestige, charisma, and heroism. In contrast, when we discuss followers, we invoke ideas of passivity, conformity, subservience, and even stupidity. In addition, the vast majority of research and media attention has focused on leadership as a positive force on followers and society, which ignores the darker side of authoritarian, toxic, and more destructive forms of leadership. The ROL perspective questions our collective fascination with leadership and our emphasis on heroism, charisma, and the glorification of leadership in the face of any real evidence that a given leader is really worthy of such praise. It also suggests that we need to approach leaders and leadership with a skepticism that they always act in the benefit of their followers and for the collective good.

## Extensions and Applications of the Romance of Leadership Theory

### Leadership Portrayals in the Media

The romance of leadership is often most clearly reflected in the images of leaders that are produced in the media and in the popular press for our daily consumption. More often than not, leaders are presented in the form of images or idealized portraits of success and popular books about leadership claim to reveal or unearth the secrets or magical formulas for effective leadership. Together, these idealized representations of leadership satisfy our appetite as a society for leadership products and behaviors that promise to enhance our lives and solve our critical problems. These romanticized images of leadership appeal both to our collective fascination with the power and status of leaders and also serve to fixate us on the personalities and characteristics of leaders themselves. In essence, these leaders become modern-day versions of the gods of Roman and Greek mythology, and we are drawn into their stories and sagas. However, these portrayals are frequently narrow and simplistic caricatures of leaders and overwhelmingly focus on positive components of leadership and its outcomes. These modern myths are dangerous, for they suggest that leaders are inherently positive forces for individuals, organizations, and humanity as a whole or are alternately demonized and vilified for their actions, providing convenient scapegoats for both organizations and societies.

The romance of leadership perspective also encourages us to examine our popular writings and research into leadership as a critical topic of study (see Bligh and Meindl 2004). These

products provide an important window into our beliefs about what constitutes leadership, why it is important, what makes it successful, and what decisions or assumptions we make about the effects of leadership. In other words, it allows us to critically examine how leadership is collectively constructed and deconstructed. How leadership is defined and discussed in popular books and media becomes critical to examine, as it informs how we select, develop, train, promote, demote, and fire our leaders. An analysis of popular leadership books from this perspective reveals that in our writings about leadership, leaders are portrayed as affecting change, possessing great experience and knowledge, and providing their followers with opportunities to reach their unique potential. These conceptualizations all fit our cultural stereotypes of "great" leadership. The ROL perspective encourages us to question and debate these assumptions, the functions that leadership serves within society, as well as the broader trends that inform our discussion about what leadership is, what good and bad leadership looks like, who is more fit to lead, and how we decide if a leader has truly made a positive impact.

## Followers and Followership

The ROL also draws attention to *followers'* perceptions of leadership as worthy of study in their own right, in parallel or independently of how the leader actually behaviors. In addition, inter-follower communications about leaders become a critical form of leadership construction and can ultimately shape or constrain a leader's influence. The ROL has motivated a growing stream of research into the needs of followers and contextual factors that may enhance or weaken our tendencies to believe in the efficacy of leadership. In other words, independently of leader-follower interactions, followers also jointly construct images of leadership, making the interactions among followers about their leader in some cases as important or even more important than the characteristics of an individual leader. Issues such as how leadership influence spreads among groups or subgroups of followers become critical, particularly in cases of large social distance in which followers have had no direct contact or exposure to a leader. In addition, understanding followers' emotional reactions to a leader plays a critical role in attributions about whether or not the leader is effective or charismatic, in some cases worthy of a vote for political office or soaring stock prices.

The ROL approach also highlights the role of sensemaking processes as integral to our understanding of leadership and ultimately may underscore why leadership is so enigmatic. Independently of individual leaders, followers also learn how to define leadership and how to discern what "good" and "bad" leadership looks like through their interactions with one another and through their exposure to media portrayals. Followers' decisions to support or even sacrifice for a leader are thus in part the result of their interactions and communications with each other, in which they share information, notes, and gossip about the leader and compare interpretations of what the leader's behavior signifies. From the ROL perspective, followers are therefore active, powerful cocreators of the leadership process, in contrast to passive, subservient, compliant, obedient "sheep" at the mercy of their leaders. Perhaps even more importantly, followers' psychological needs, beliefs about what ideal/charismatic/effective leadership is, and their attributions about what outcomes leaders are responsible for all play a crucial part in the leadership process.

Meindl's research demonstrated that individuals in leadership roles are perceived to be more charismatic to the extent that the organization they lead undergoes a crisis turnaround (e.g., moving from loss to profit) rather than a crisis decline (e.g., moving from profit to loss). Charismatic attributions are also strongly impacted by inter-follower interactions, suggesting that beliefs about the charisma appeal of a leader are literally "spread" from follower to follower in a process Meindl referred to as social contagion. These processes help to explain why there are so many discrepancies in perceptions of charisma of the same leader. Other research has examined how and why followers vary in their susceptibility to charismatic appeal. For example, the first followers to succumb to the charismatic "virus" are likely to be high in

agreeableness and emotional intensity. In addition, those who are more central and connected to others in a given social network are more likely to "spread" charismatic appeal to others. Finally, perceptions of crisis, uncertainty, and threat have all been shown to increase followers' tendencies to attribute charisma and performance outcomes to leaders (see Bligh et al. 2011).

## Conclusion

Meindl argued that the romance of leadership perspective was not "anti-leadership," but an alternative to the unbalanced equation between leadership and followership. He pointed out that most theories place greater weight on leaders and implicitly assume that leaders' actions all have equal importance and significance. The ROL perspective does not reject the importance of leaders in leadership outright; however, it points out that it is easier to believe in leadership than it is to prove it and challenges us to examine what leadership is not. In addition, it asks us to question the implications of our continual fascination with leaders to the detriment of followers and contextual factors. Ultimately, the ROL suggests that we need to balance leader-centered approaches with more follower-centered perspectives and recognize that ultimately leadership is in the eye of the beholder.

# Rural Development

Christopher L. Atkinson
Walden University, Minneapolis, MN, USA
School of Public Administration, Florida Atlantic University, Boca Raton, FL, USA
School of Public Administration, Florida Atlantic University, Fort Lauderdale, FL, USA

## Synonyms

Agricultural development; Enhancement; Improvement; Modernization of extra-urban spaces

## Definition

*Rural development* involves efforts that are economic and social in nature intended to encourage concepts of retention, growth, and expansion in areas outside cities, including improving quality of life for rural residents through such activity.

## Introduction

The rural, beyond being defined as that which is not urban, is a contested space from a definitional standpoint. Rural can be taken to mean from or of open areas – those outside cities. Rural has a common strand of meaning with country or countryside but is more frequently encountered with such nomenclature in public policy. Rural, as a word, is also endowed with other sorts of value: it

is associated with agriculture and farming and people from outside city areas. Connections are made between people from rural areas and the land itself. While a contrasting relationship might be supposed between rural and urban, more properly, a continuum exists between the two as definitions of rural and agriculture are altered due to the forces of modern living and ultimately bear less resemblance to historical identities (Friedland 2002). Nevertheless, rural areas have a rich history and identity of their own, even while they share some aspects in common with urban areas (Woods 2011). Rural development, for purposes of this entry, encompasses efforts that are economic and social in nature, intended to encourage growth or expansion in areas outside cities.

This entry considers rural development from a variety of perspectives, including economic aspects, infrastructure and service considerations, sociocultural factors, and the role of stakeholders.

## The Possibility of the *New Rural*

It would be a mistake to assume that there is homogeneity in the supposed blank canvas of the rural. For one, the canvas is not blank; rural areas are distinctive. The idea of a compelling interest in developing areas outside cities has been a forceful direction in many nations and is not recent. What is more contemporary, possibly, is the practice of forming the *new rural* in any given location, as the focus has shifted away from a sectoral perspective to one informed by place and context. In new rural development, place matters. The modern conception of the rural does not harken back to times in the distant past when most people in a rural community were of a single class and industry, with little to differentiate them (Marx 2000). The rural is instead a representation, actively made more or less real by those that ponder it, as a place of opportunity and beauty (Woods 2011). The collective sense of rural places is heavily informed by the past and shared ideals of pastoral sensibilities and of escapes from the harsh reality of the urban lifescape (Marx 2000). Rural development is a seeking out for what was and what could yet be; for some, it represents a defiant strike at an existence grown wearisome, and for others, it is a hand up to overcome significant socioeconomic barriers, possibly made worse by geographical factors like distance from urban areas and jobs located there.

Rural areas have seen "improved rural-urban income parity, farm population decline, and significant rural economic diversification" over the past century (Irwin et al. 2010, p. 523). Having experienced great change, rural areas are sources of both vulnerability and untapped potential. While there are significant stresses associated with transformation, understanding the great potential that exists for rural development is essential for projects to succeed. In that respect, rural development is not simply about the merits of processes and projects themselves; the possibility for success profoundly weighs on awareness of context. Rural business is unique – it may not just be about making money for those that seek to make a living in rural spaces. Rural life can invoke a sense of community, of working together, and social change. These efforts exhibit holistic traits, such as "sustaining local services, maintaining the local population, reducing negative climate impacts of long car journeys through providing local services and employment, and sustaining local community events, social capital and a strong sense of local identity" (Steiner and Atterton 2015, p. 43).

## Economic Aspects

It has been noted that rural places are undergoing transformation due to "globalisation, economic downturn, public sector budgetary pressures, demographic ageing, and climate and environmental change" (Steiner and Atterton 2015, p. 30). There has been a dramatic shift in jobs in rural areas: traditional rural jobs (mining, farming, and manufacturing) account for only about a fifth of total nonmetropolitan area employment. Two-fifths of rural employment is in typical service-type work like what would be seen in cities (health care and retail, for example); the balance of

employment is in construction, transportation, and other services (Irwin et al. 2010).

The Organisation for Economic Co-operation and Development (OECD) put forward the question of whether development in rural areas was a territorial or sectoral issue, ultimately determining that it was a place-based question rather than a topic best dealt with through the imposition of policies (2003). A sectoral-based approach to rural policy choices would leave only a few well-entrenched actors in the policy arena – notably agriculture, mining, and petroleum. Agricultural interests have historically informed policy choices with respect to rural areas in many regions, and the interests of agribusiness have been favored over other conceptions of rurality. As competing views have become more well defined, however, the view of rural areas as one and the same with farming, or merely places where oil extraction occurs, have become increasingly inaccurate, if not obsolete. A major influence is employment potential: agriculture has declined in its ability to support well-paying jobs in rural areas and areas that focus on such business as a specialization find themselves subject to the whims of commodity markets. Although rural land use for agriculture remains strong, and productivity is high, employment has been reduced precipitously. How rural areas are changing involves choices made not just by agricultural interests but multi-sectoral stakeholders (OECD 2003).

Even as rural areas have moved away from too much reliance on one sort of business, some of the standard advice for urban development, such as diversification of industries to encourage resilience, industrial clustering of firms, or hesitance on supporting entrepreneurial development, may not be appropriate in rural areas. Such efforts might mitigate risk, but in rural areas, some risk may be acceptable if the potential harm from a failed effort can be moderated. Society-wide risks like shocks against an entire system pose significant threats to both urban and rural areas; these may prevent the taking of worthwhile risks on what are otherwise positive potential business deals. The lack of diversification in a rural community might not be a fault, as it could be in an urban center, if the risk pays off. If a rural area balances the risks and rewards of its development choices, toward increasing output of interest to the world outside the area, it is likely on the right path (Freshwater 2015). Putting nothing forward, however, will accomplish no gain. This is especially true in rural areas, where there may be a lack of interest in the place, as existing interests cling to "what was" about the locale and fail to see a possible bright future for the community.

Scale and management of expectations are central considerations in rural development. From an economics perspective, it may seem that agglomeration economies – where like businesses tend to accumulate for mutually supportive reasons – may be more closely aligned with urban locales, due to the fact that "macro variables such as innovation, productivity, growth, and development are greater in more densely populated areas" (Naldi et al. 2015, p. 96). However, this does not mean that rural areas lack potential for "matching, sharing, and learning processes," and indeed a marginal increase may be felt more strongly in a rural area than in an urban region (Naldi et al. 2015, p. 97). Applying principals of smart development, as may be seen in urban economies, one may expect to see smaller-scale agglomeration tendencies, "natural and recreational amenities as well as creative economies," (Naldi et al. 2015, p. 96) and networks and exchanges for research and development, specifically calling for development of high-speed broadband connectivity to facilitate learning and sharing of knowledge. Broadband also assists e-commerce, which has become a source of revenue to rural areas.

Tourism-related business in rural areas has increased; this may be tied to identity, which is "vital for the constitution of entrepreneurial processes" (Berglund et al. 2016, p. 91). Contrary to convention that suggests that rural areas should imitate urban centers, rural areas could become cognizant of what is in their communities, embracing the entrepreneurial spirit to create something unique to the place, thus forcing residents to rethink the essential identity of their community (Berglund et al. 2016). In preservation terms, it has been offered that "effective

management of the natural heritage is required for economic and well as environmental reasons" (Courtney et al. 2006, p. 481). As a result, tourist enterprises in rural areas would do well to support the sustainability of natural features and reduction of potential damage through effective management, given the close tie of natural features to the maintenance of place identity.

## Infrastructure and Service Concerns

Rural development is not entirely dissimilar from its urban counterpart. It deliberates on many of the same general issues that would affect development decisions in urban settings but employs a perspective that considers and values the unique context of the rural environment. Resources, organization of community and policy/program structures, and delivery of services to communities are all concerns. While the types of issues themselves might be largely the same, infrastructure is a point of serious concern for rural areas, especially those with an eye toward growth.

There are concerns about the ability of rural communities to handle the consequences of growth, when development plans work as intended. It is expected that rural development efforts yield results that are desirable, but the intricacies of the deal, such as infrastructure improvements (sanitation, education, and even access to electricity) may not have been included in the plan. These are essential investments with benefits that may serve other development projects. Waste handling, sewer system capacity, water supplies, and housing are significant in rural areas just as they are in urban areas, but the resources to address needs may not be available in the amount necessary to address concerns as they arise. In some cases, increased distances between individuals living in rural areas can create infrastructure issues. Provision of police and fire services, as well as transportation, is made more difficult by the dispersal of population over large areas.

Transportation and housing are major development issues facing rural areas. Where social disadvantage exists in rural areas, it is often stoked by a lack of transportation and housing (OECD 2003). Populations in these areas can experience other symptoms of disadvantage, including high unemployment. As a cause for development, rural communities often find that they were founded because of a natural feature of some sort. This may have driven development in the past, particularly for manufacturing or agriculture – such as location near a river or a place with rich soil – but now those features may be less important to the choice to live in a location than, for example, proximity to existing development or location on a major transportation line.

Efforts to improve the competitiveness of rural areas for development purposes include provision of amenities and identification of industry clusters for potential attraction of new businesses; focusing on eco- or agritourism; place-based approaches to development; and creating entrepreneurial opportunities through attention to knowledge centers, such as training and especially distance learning (OECD 2003). Scott et al. (2016) have applied Nussbaum's Central Human Capabilities taxonomy to the choice some artists make to locate in rural areas, contrasting with the view that the creative class normally chooses to locate in urban areas. They specifically highlight internet connectivity as a decisive factor: "Broadband connectivity potentially enables the development of the creative economy in areas previously considered too geographically remote from urban creative hubs to participate in this sector," though the reality is that broadband is not universal in rural areas, so this promise is limited (Townsend et al. 2016, p. 7).

## Sociocultural Factors

Educational, health, and employment services are essential in rural areas, as they are in urban areas, but the particular needs may be different. Educational attainment in rural areas may be relatively less than in urban areas; this may drive unemployment, which in turn prevents attention to resolving needs in the educational sector (CRS 1979). Enduring poverty may be the result. Even though much has been done to improve education in rural

areas, rural areas still trail urban areas, and a gap exists in secondary and college attainment. This negatively impacts development prospects, as an educated workforce is an attracting and sustaining factor for business. Those with lower educational outcomes generally have higher unemployment rates in rural areas. Some groups are more affected than others by this disparity. In the United States, "minority populations in nonmetro areas have significantly lower levels of educational attainment" (USDA ERS 2016). Rural development efforts may not always pay adequate or due attention to the needs of disadvantaged groups. Problems in rural areas can be more aggravated for these populations for reasons of access including language, necessitating a fresh look at how development policy can be more inclusive.

Food insecurity and concerns about climate change have driven policy discussion toward sustainable development in many instances (Behnassi et al. 2011). However, rural and agricultural development projects have significant, and in some cases negative, implications for areas where the development takes place. In additional to the educational issues noted above, some changes, such as environmental degradation, crowding, and a rise in crime rate, might also be expected (Baig and Straquadine 2011). These additional considerations are not purely "rural" development issues, as they are encountered in development generally. In the case of rural development, the issue becomes one of balancing what is being given up in favor of the benefits received – and whether the return on investment makes sense over the short and long term. Ideally, rural development takes into consideration long-range societal goals and attempts to conserve resources as much as possible.

## Stakeholder-Led Views of Rural Development

The line between urban and rural areas has become less clear. As people from urban areas move to rural areas, they are creating new communities, but these communities are not necessarily like those created in the traditional manner, with shared experiences and cultures. They are from inception diverse and more like modern cities in that respect. Governments of such areas, and their consequent policy environments including development priorities, should therefore be reflective of a bottom-up shared vision of community and specifically the uniqueness of the place and the people there.

Rural development is not a straightforward matter. There are open questions about the best approach to be taken to achieve desired ends – whether that is a top-down, intercession-based model, or the hands-on model that includes a variety of viewpoints. This is not an easily addressed question, as the nature of rural areas has shifted, from primarily a farming perspective to one that encompasses a range of possibilities. Rural development also stands at the intersection of often unique economic, legal, and policy questions. There can be distrust of outsiders, which can undermine a development effort. A psychosocial inability for developers to understand rural residents and their context can be devastating to both efforts for rural development, rural places, and the residents of such areas. Rural residents might have, for example, taken themselves to be responsible for their plight, or to be individually responsible for failures external to their communities, including regional, national, or even international economic shifts. For these reasons, rural development may thematically focus on bottom-up views and consider social change and the needs of the neglected, to create a safety net that considers issues beyond jobs or increased wealth (Landini et al. 2014).

Rural development shares in common with sustainable development calls for transparency, monitoring of efforts by local stakeholders, the sharing of visions and ideas for development activities, and a sense of ownership for the outcome of such efforts (Khongsatjaviwat and Routray 2015). Recognition of the importance of stakeholder involvement is essential to successful rural development projects. Stakeholder participation not only helps assure project success – it creates a stronger community amongst the

participants. Time spent identifying potential stakeholders and planning for their involvement is consequently well spent (Usadolo and Caldwel 2016). In the case of public-private partnerships, which may have positive application in rural contexts, an equalization of public and private actors for management and leadership of development activities may be advisable. There is a place for both developmental and regulatory roles in rural development. It is perhaps not sufficient to involve stakeholders at the outset, only to inform them, while failing to allow them a place in the decision-making process (Bjärstig and Sandström 2017).

## Concluding Thoughts

The present state of rural development is not primarily farm-focused; considerable emphasis has been placed on what is an increasingly interdependent continuum between rural and urban places. The connection of natural amenities and rural development remains important (Irwin et al. 2010); opportunities that exist beyond agriculture and traditional land-use patterns are varied. Rural communities have become more creative in achieving development success by making better use of unique sense of place and fashioning vibrant combinations of the original in historic places and the new from elsewhere.

In any rural development program, there is a need to ensure that programs are meeting their intent. A short-run and long-term view of development in a particular area is necessary to achieve planned successes while limiting unintended and even harmful results. Sometimes outcomes that benefit communities more generally (i.e., that aid several potential projects, through infrastructure improvements, or help the marketability of a place) can be explained through qualitative approaches, relying upon methods like focus groups, rather than quantitative means that would be more appropriate in urban settings (Buragohain and Landge 2014). It is essential to tell the story – not only of the project but of the community and its evolution – where it has been and where it hopes to go.

That said, Paul Gruchow wrote that "It is an odd irony that the places we call empty should retain some memory of the diversity of life, while the places we have filled up grow emptier and emptier. If we knew what we were getting rid of, we might have some premonition of the things we are going to miss" (1988, p. 12). It is relevant to consider that these rural places, "empty" in some sense relative to their urban counterparts, are not hollow spaces or canvases upon which a mark may be left but exceptional and worthwhile in their own right. The best sorts of development of rural areas recognize the inherent goodness of place and people and serve to highlight those qualities, rather than simply imitate the urban out in the country. It is the diversity of life and the things that are collectively missed that call people to rural places, so that those things may be retrieved and enjoyed again. Smart developers recognize this understanding, and superior rural development celebrates it.

# Rural Procurement in Indonesia

Asep Sumaryana and Erwin Sondang Siagian
Public Administration Department,
Faculty of Social and Political Sciences,
Universitas Padjadjaran, Bandung, Indonesia

## Synonyms

Procurement; Regulation; Rural budget

## Definition

Rural procurement is defined as activities to obtain goods/services by the rural government, either through self-management or through providers of goods/services whose budgets are sourced from the rural budget and revenue.

## Introduction

Indonesia has many regulations related to its procurement policy. They include the following: (1) regulation for the government public procurement (regulated by Presidential Regulation No. 16 of 2018 concerning government procurement); (2) regulation for procurement of public-private partnership (regulated by Regulation of the Head of National Public Procurement Agency (NPPA) No. 19 of 2015 concerning procurement of business entities in cooperation with the government and business entities); (3) regulation for procurement of legal entity institutions (regulated by Government Regulation No. 26 of 2015 concerning forms and mechanisms for funding legal entities); (4) procurement regulation for state-owned enterprises (regulated by Regulation of the Minister of State-Owned Enterprises No. 15 SOE Minister Regulation PER-15/MBU/2012); (5) regulation for procurement of regional-owned enterprises (regulated by Government Regulation No. 54 of 2017 concerning regional-owned enterprises); (6) regulation for

procurement of goods/services in public service bodies (regulated by Government Regulation No. 23 of 2005 concerning financial management of public service bodies); and (7) rural procurement regulation (regulated by Regulation of the Head of NPPA No. 12 of 2019 concerning guidelines for preparation of procedures for rural procurement as the latest regulation). The new government policy aimed at regulating rural procurement in Indonesia gives a new hope for its implementation. The new policy for rural procurement is highly strategic for two reasons: First, the number of villages in Indonesia has reached nearly 75,000. Second, the rural budget and revenue (APBDes) have continued to rise every year. The regulation mandates that 70% of the APBDes is allocated for development. The implementation of development policies relates to procurement of goods/services in rural administrative in Indonesia.

Before the introduction of the Regulation of the Head of NPPA No. 12 of 2019 (Perka), rural procurement was managed through the regulation of the Head of NPPA No. 13 of 2013 and Head of NPPA No. 22 of 2015. There are several shortcomings in Perka No. 13 and Perka No. 22, as there is no procurement document model such as the agreement/contract document model, and the model provided an example/negotiation document model. In addition, the old regulation did not allow the use of electronic goods/services procurement facilities. The other shortcoming relates to the potential conflict of interest among rural government officials in implementation of rural procurement. This is because the rural government apparatus, in addition to being a party performing the selection of providers of goods/services can simultaneously also play the role of overseeing implementation of work. Some of the shortcomings of the old regulation have been corrected in the new regulation on rural procurement.

## General Controls

Perka No. 12 of 2019 has corrected some of the shortcomings of the earlier regulations on rural procurement of goods/services. As a new rule, Perka No. 12 of 2019 defines several things, which include the following: (1) A village is a legal community unit that has the authority to control and manage government affairs, interests of the local community based on community initiatives, original rights, and/or traditional rights recognized and respected in the government system of the Unitary Republic of Indonesia. (2) The rural government is the Village Head or can be referred to by another name assisted by Village Apparatus as an element of the rural government organizer. (3) Rural procurement is defined as activities to obtain goods/services by the rural government, either through self-management or through providers of goods/services whose budgets are sourced from the rural budget and revenue.

Furthermore, self-management is a method of obtaining goods/services independently by the Activity Administrator Team (*Tim Pengelola Kegiatan/*TPK) and/or the local community. Activities through goods/services providers can be done through a direct purchase scheme (procurement method implemented by buying/paying directly to one provider without a written bid request made by the Head of Section, Head of Affairs, or TPK). The other scheme for procurement of goods/services can be implemented through a bid request (procurement method performed by the TPK by buying/paying directly with a request for a written offer to at least two providers) or an auction (provider selection method for all jobs that can be participated in by all qualified providers).

## Administrative Elements of Rural Procurement on Goods/Services

There are two elements in the implementation of rural procurement of goods/services: from the elements of the rural government or goods/services providers. The elements of the rural government include the Village Head, Head of Affairs, Section Head, and TPK. The Village Head is a rural government official who has the authority, duties, and obligations to conduct the village's

household tasks and perform duties on behalf of the central government and regional government. The Head of Affairs is a Village Apparatus who as an element of the Village Secretariat staff performs the tasks of the Village Financial Management Administrator (PPKD). Furthermore, the Section Head is a Village Apparatus who as a technical administrator manages the Village Financial Management (PPKD). Finally, the TPK is a team that assists the Section Head or Head of Affairs in performing procurement of goods/services which, due to their nature and type, cannot be performed alone by the Section Head or Head of Affairs. Meanwhile, the goods/services provider can take the form of a business entity or individual that provides rural needs on goods/services.

The other elements involved in rural procurement of goods/services include the people of the Government Internal Supervisory Apparatus (APIP) and the Regional Head (Regent or Mayor). The community plays a role in self-management and oversight of procurement activities. Furthermore, the APIP is an apparatus that conducts supervision through auditing, reviewing, monitoring, evaluating, and other supervision activities regarding implementation of duties and functions of the government (including the rural government). Meanwhile, the Regent/Mayor conducts guidance for rural procurement that includes the process of establishing Regent/Mayor regulations, consultation, and technical guidance for rural procurement.

## Governance

For a public institution, the implementation of rural procurement of goods/services must meet good governance (Komarudin 2011). Therefore, the principle of procurement and procurement ethics in the implementation of rural procurement is crucial for good governance.

The principles in implementation of rural procurement of goods/services include the following matters: The first principle is efficiency, which suggests that procurement must be endeavored using minimum funds and power to achieve quality and targets within the stipulated time or using funds that have been determined to achieve results and targets with maximum quality. The second principle is effectiveness, which indicates that procurement must be in accordance with the needs and targets set while providing maximum benefits to the community. The third principle is transparency, which suggests that all provisions and information regarding procurement are clear and can be widely known by public and interested providers. The fourth principle is openness, which indicates that procurement must enable participation of all goods/services providers who meet certain requirements/criteria based on clear rules and procedures. The fifth principle is community empowerment, which suggests that procurement must be used as a vehicle for learning for the community enabling it to manage the development of their village. The sixth principle is mutual cooperation, which means the provision of labor by the community in implementation of development activities in the village. The seventh principle is competitiveness, which suggests that procurement must be done through fair competition among as many providers as equal and by meeting the requirements. The eighth principle is fairness, which means giving equal treatment to all prospective providers and does not result in benefit to certain parties. The last principle is accountability, which suggests that it must be in accordance with rules and regulations related to procurement, so it can be accounted for.

The next issue relates to procurement ethics. These ethics include the following: (1) performing tasks in an orderly manner, accompanied by a sense of responsibility to achieve objectives, smoothness, and accuracy in procurement of objectives; (2) working professionally and independently and maintaining the confidentiality of information to prevent procurement deviations; (3) not influencing each other directly or indirectly that may result in unfair business competition; (4) accepting and being responsible for all decisions made in accordance with the written agreement of concerned parties; (5) avoiding and preventing conflicting interests of related parties, both directly and indirectly, that may result in an

unfair business competition in procurement; (6) avoiding and preventing waste and leakage of village finances; (7) avoiding and preventing the abuse of authority and/or collusion; and (8) not accepting, not offering, or not promising to give or receive gifts, rewards, commissions, rebates, and anything from or to anyone known or reasonably suspected in connection with procurement.

## New Control Content

There are three new regulations of rural procurement on goods/services, which include the conflict resolution; electronic development, supervision, and procurement; and stipulation of land acquisition controls.

For a conflict resolution control, the first choice that can be taken by the parties involved in a conflict to resolve the conflict is through a deliberation to reach a consensus among parties. The deliberation for this consensus is very much in accordance with the noble values of the constitution of the Indonesian nation (the 1945 Constitution). Furthermore, if the deliberation does not lead to consensus, the Village Head will lead the deliberation to settle the conflict. If the deliberation for consensus and the deliberation led by the Village Head fail to achieve the desired objective, the parties can settle the conflict through the "Procurement Contract Conflict Resolution Service" or through the legal system.

The next new control is the affirmation of the regional apparatus organization in charge of governance and the empowerment of the rural community as supervisor for rural procurement of goods/services. In performing the development function, the guiding agency concerned can include the goods/services procurement work unit in each local government. In addition, the supervising agency can also consult the LKPP. The next control is the electronic rural procurement of goods/services.

The next new and significant control relates to the affirmation that the environmental sphere of rural procurement of goods/services does not regulate land acquisition for the benefit of the rural area. This control also ended the polemic about which regulations became a reference in land acquisition for the benefit of the rural area.

## Shortcomings of the New Regulation

There is one shortcoming in this new regulation. It relates to the use of the Regulation of the Minister of Home Affairs No. 20 of 2018 concerning the management of village finances in one of the considerations to establish the Regulation of the Head of NPPA No. 12 of 2019. If the Minister of Home Affairs Regulation No. 20 of 2018 is revised or revoked, the Head of LKPP Regulation No. 12 of 2019 must also be revised or revoked. In addition, the legal position of the Minister of Home Affairs Regulation No. 20 of 2018 and the Regulation of the Head of LKPP No. 12 of 2019 is equal, so the Minister of Home Affairs Regulation No. 20 of 2018 should not be considered in the Head of LKPP Regulation No. 12 of 2019.

## Conclusion

Although there is one shortcoming in the Head of LKPP Regulation No. 12 of 2019, in general, the content in this regulation has resolved several issues that could not be done through previous rules. Resolving these issues is critical, so the implementation of rural procurement of goods/services can be in accordance with good governance.

The 1945 Constitution

# Russia, Administrative Reform

Igor Bartsits
Institute of Public Administration and Civil Service, the Russian Presidential Academy of National Economy and Public Administration, Moscow, Russian Federation

## Synonyms

Administrative transformation; Public administration reform; Transformation of government bodies

## Definition

Russia's administrative reform is a sound and holistic system of measures intended to modernize the various institutions of executive power of the Russian Federation in order to create highly efficient machinery of government meeting the needs of modern Russian society. Most commonly, an administrative reform covers areas such as organizational structure, decentralization, personnel management, financing, provision of public and municipal services, and optimization of supervision and compliance monitoring, which includes putting in place a proper legal framework, including public service laws, and solving other issues.

## Introduction

Historically, the majority of developed and developing states feel the need to improve their system of government under the pressure of the challenges that emerge in the course of their social, economic, and political development. Thus, the failure of the system of government to meet the development needs of the economy and society caused a complete collapse of the entire political and legal system of the Soviet Union in 1991.

In the context of international law, the Russian Federation, with its new frontiers and political system, became the successor of the Soviet Union. The country needed a political and economic overhaul. A legal foundation for the transformation of the country's government system was provided by the Constitution of Russia of 12 December 1993, which entrenched the key principles of the Russian political system: people's rule, national sovereignty, republicanism, federal form of government, separation of powers, social character of state, rule of law, secularism, protection of the rights and freedoms of man, local self-government, multi-party system, ideological and political pluralism, supremacy of law, and diversity of forms of ownership. It is based on these constitutional principles that Russia engaged in reforming its government institutions.

The administrative reform in Russia is intended to:

1. Improve the system of government so as to make it capable of ensuring the integrity and sovereignty of the Russian state and protecting the national interests of Russia both domestically and internationally.
2. Modernize the state machinery, most importantly the system of executive power whose principal function is to observe the laws and to ensure compliance countrywide.
3. Optimize the legislative regulation of the state, society, and citizens.

The goals of the administrative reform in the Russian Federation are as follows:

- Improving the quality and accessibility of public services.
- Limiting the government intervention in the economic activities of businesses and entrepreneurs, including bringing to an end excessive state regulation.
- Improving the efficiency and effectiveness of executive authorities.

All in all, Russia's administrative reforms pursue the same goals and objectives as those carried out by other countries.

## The Stages of the Russian Administrative Reform

It took the Russian Federation quite a long time to understand the administrative reform theory and develop its legal framework. This period can be split into several stages (Bartsits 2019).

*The first stage of the government reform (1992–1995)* was intended to free the economy from total state control, transform the system of pricing, and privatize state property, including through attraction of foreign investors. Initial reorganization of the system of government was conducted: the number of sectoral ministries was reduced although the sectoral approach to the management of the economy, albeit slightly modified, continued to exist until the late 1990s; several new regulatory institutions were established such as the state committees – for administration of state property, antitrust policies, etc.; the country's federal structure was changed through granting broader powers of autonomy to the constituent entities of the federation and increasing the authority of local communities.

In the 1990s, the transformation of the principles and methods of public administration was deliberately put away for later, the system of government continued to rely on many of the approaches of the Soviet-style administrative system and sectoral management. This deliberate postponement was explained by the lack of prerequisites for reformation of the system of government, including (a) the lack of loyalty of a significant number of state officials to the country's leadership, and (b) insufficiency of financial resources. There was a significant gap between the revolutionizing economy and socio-political landscape and the obsolete methods of government. No major changes were made in the system of executive authorities; no structuring of executive bodies based on their respective functions was completed.

Under these circumstances, the country's leaders were afraid of losing control. The abandonment of the system of centralized control over the economy and society by the Communist Party and Soviet government resulted in losing grip on the state apparatus, soaring corruption, and other negative developments. Prerequisites and

opportunities for an effective reform of the system of government were emerging.

*At the second stage of the government reform (1996–1998)*, the conceptualization of the necessary administrative changes began and the approaches to the transformation of the system of public administration in the Russian Federation were developed. In September–October 1997, the term "administrative reform" was introduced. It is then that the *Concept of Administrative Reform* was proposed in lieu of the *Program of State Building* previously developed under the guidance of the commission which had been established under the order of the President of the Russian Federation of 7 May 1997 (members of the commission were Valentin Yumashev, Mikhail Krasnov, Georgy Satarov et al.) and announced by President Boris Yeltsin in his Address to the Federal Assembly of the Russian Federation. In 1998, President Boris Yeltsin presented key provisions of the Concept of Administrative Reform in his Address to the Federal Assembly of the Russian Federation.

The authors of the administrative reform understood it as a "chain of successive, staged measures allowing to introduce new principles, methods and structures without losing control. It was emphasized that to improve the efficiency of government it was crucial to have a sound system of executive power with properly structured executive bodies and clear differentiation of their legal status. The shortcomings of the Concept included its divorcement from the strategic development goals of society and formalist approach to the solution of complex political and economic problems." (Vishnyakov 2003)

It must be admitted that, amid the severe economic crisis of 1998, no practical steps were taken to implement the measures proposed by the Concept of Administrative Reform. Key goals and objectives of the Concept, as well as the successive steps envisaged by it, were put to practical use later in the reform of the early 2000s.

*At the third stage of the administrative reform (1999–2002)*, it was concluded that Russia's system of government needed complete modernization rather that gradual improvement. A roadmap comprising initial steps was presented in Presidential Addresses to the Federal Assembly (parliament) of the Russian Federation. In his 2000 Address, President Vladimir Putin says, "Our primary objective is to get our power structures organized; however, it is not our ultimate goal but just the first step in the modernization of our state." The Presidential Address of 2001 says, "We have to launch preparations for an administrative reform, first of all, to reform the government, the ministries and agencies, and the territorial administrations. And we should transform not only and not so much the structure and the staffing of the organs of power as – and this is the most important part – their functions."

To achieve this, it was necessary, first, to modernize the entire system of executive power; second, to introduce an efficient and explicit mechanism of decision making and execution, and; third, analyze the existing mix of state functions in order to keep only those that were really necessary. The understanding of this necessity determined the course of modernization of the system of government and the goals of administrative reform.

Of all the important analytical documents of this stage particularly notable is *The Strategy of the Social and Economic Development of Russia Through 2010* designed in 2000 by the Center for Strategic Research. The Government of the Russian Federation considered the Strategy and approved its key provisions; however, it has never been officially adopted. Nevertheless, the fundamental premises of the Strategy, such as promotion of transparency of the government, transformation of executive authorities, and ban on vesting rule-making, supervisory and regulatory functions as well as functions related to the management of federal property and provision of public services, in the same executive bodies, were implemented at later stages of the reform.

At the same stage, namely, in August 2001, *The Concept of the Reform of the System of Public Service of the Russian Federation* was adopted.

*The fourth stage of the administrative reform (2003–2005)* yielded concrete results such as streamlined functions of the bodies of executive power, reformed public service, improved administrative procedures, and newly established

administrative justice. Crucial for turning the administrative reform into reality was the Presidential Decree "On 2003-2004 Administrative Reform Measures," which stipulated the priorities of the administrative reform.

To build on the achieved, a standing advisory body – the Administrative Reform Commission under the Government of the Russian Federation – was established by Presidential Decree #824 of 23 July 2003 "On 2003-2004 Administrative Reform Measures.".

While in 1997, the concept of the government reform was focused on reinforcing the regulatory and supervisory functions of the executive authorities through enhancement of the role of long-term and short-term forecasting in strategic decision making and designing an optimal structure of executive bodies capable of meeting real needs of society, in 2003, the key idea of Russia's administrative reform was significantly changed and focused primarily on limiting the intervention of the state in the economic activities of businesses, including putting an end to excessive state regulation, as well as on improving the quality and availability of public services.

At this stage, an inventory of public functions was taken, especially those vested in the executive authorities, both federal and regional. Thus, a specially established commission analyzed all the functions performed by the executive bodies. The commission identified 5,634 functions of which 1,468 were found unnecessary, 263 overlapping, and 868 requiring modification. Then, the principle of functional interrelationship between the types and functions of executive authorities was introduced, and a reform of these authorities was carried out based on this principle. Thus, the type structure of the bodies of executive power of Russia was revamped and the total number of ministries and agencies was drastically reduced. The Decree of the President of the Russian Federation of 9 March 2004 "On the System and Structure of Federal Bodies of Executive Power" introduced a tripartite model comprising federal ministries, federal services, and federal agencies.

At this stage, the framework Federal Law "On the System of Public Service of the Russian Federation" of 27 May 2003 and Federal Law FZ №79 "On State Civil Service of the Russian Federation" of 27 July 2004 were passed.

*The fifth stage of the reform (2006–2010)* was focused on the implementation of the Concept of the Administrative Reform in the Russian Federation in 2006–2010, as well as the plan of reform activities that included the following:

- Migration of the bodies of executive power to the principles and procedures of results-based management
- Development and introduction of standards for the public services provided by executive authorities, as well as administrative regulations for the bodies of executive power
- Establishment of multifunctional centers for provision of public and municipal services
- Digitalization of public services
- Optimization of the bodies of executive power, and introduction of the mechanisms designed to counter corruption in the bodies of executive power
- Improving the efficiency of interaction between the bodies of executive power and civil society, and increasing the transparency of executive authorities
- Upgrading the executive authorities' information systems
- Providing adequate organizational, information, human and other resources of the administrative reform, and improving the mechanisms intended to promote best practices in public administration

At this stage, attention was mostly concentrated on the improvement of public services and ensuring transparency of state authorities. This stage proved successful in a number areas, including the following: (a) the bodies of executive power began introducing key performance indicators to measure their regulatory effectiveness; (b) changes took place in the system of technical regulation and licensing of various activities; (c) national standards for state and municipal services were adopted; (d) results-based management mechanisms were introduced; (e) the system of control and oversight was reformed (although not in full).

*The sixth stage (from 2010 through the present)* is characterized by further development of the system of public administration, reformation of the system of public service, and improvement of the legal framework. Key documents of this stage are the following:

- "The Concept of Reduction of Administrative Barriers and Improvement of Access to Public Services for 2011–2013"
- Federal Law № 210-FZ of 27 July 2010 "On Organization and Provision of State and Municipal Services"
- Decree of the President of the Russian Federation № 601 of 7 May 2012 "On the Main Directions in Improving the Public Administration System"
- Executive Order of the Government of the Russian Federation № 934-p of 17 May 2016 "On the Main Directions in the Development and Introduction of a System of Evaluation of Control and Oversight Activities Effectiveness and Efficiency"
- Decree of the President of the Russian Federation № 474 of 21 July 2020 "On the National Development Goals of the Russian Federation through 2030," etc.
- The 2019–2020 government resolutions package concerning the implementation of the "legal guillotine" roadmap aiming to repeal obsolete control and oversight laws and rules.

## Key Focus Areas of the Administrative Reform

Key activities *intended to improve the quality of public administration* are specified in the document entitled "Key Focus Areas of the Government of the Russian Federation Through 2024." They include the following:

### Improvement of Control and Oversight

The objective is to reduce the administrative burden for entrepreneurs and businesses, improve the effectiveness and efficiency of control and oversight functions. Critical for improvement of control and oversight activities is the introduction of risk management mechanisms, including analysis and evaluation of performance by legal entities and individual entrepreneurs. All socially significant and large-scale types of state control (oversight) and municipal control will assume the risk-based approach. In the future, the risk-based approach is expected to become ubiquitous.

In order to achieve comprehensive upgrading of mandatory requirements, it is planned to employ the "regulatory guillotine," which envisages updating all the mandatory requirements adopted before the middle of 2010 and analyzing the actual positive (or negative) outcomes of the adoption of rules and regulations, as well as the effectiveness of regulatory activities from the perspective of attainment of their goals. This measure is intended to help get rid of those rules and regulations that are no longer relevant.

### State Property Management

To step up the pace of economic development, the following measures will be implemented:

- Minimizing participation of the state in the companies doing business on competitive markets – the number of state-invested companies will be reduced by 10% per annum.
- More efficient management of state-invested companies through improving enterprise management mechanisms.
- Putting in place new models of disposal of state-owned and quasi-public property, including auctions in a format designed to attract strategic investors while taking into account the industry-specific characteristics of such property.
- Full migration to electronic auctioning in disposal of public and municipal property.

For more efficient use of public assets, mechanisms will be introduced allowing targeted redistribution of state and municipal property between public owners, including among other things transfer of assets to another ownership level.

1. *Development of strategic management and project management mechanisms*

One of the key tools intended to improve the efficiency of public administration is the state programs of the Russian Federation and the state programs of the constituent entities of the Russian Federation, that are implemented in accordance with the project management principles. To put in place timely administrative measures aimed at achieving the desired key performance indicators (KPI's) and measure the efficiency of federal budget expenditures, the implementation of such measures is continuously monitored.

2. *Improving the efficiency of public expenditures, including government and municipal procurement*

   The objective is to create new and enhance and improve existing approaches to increasing the efficiency of budget expenditures planning and execution, including the following:
   - Improving the methodology of substantiation of budget appropriations.
   - Putting in place a system of budget spending review.
   - Enhancing the mechanism of treasury support all the way to the recipient of budgetary funds, including pilot integration, for the purpose of such support, of the system of the Federal Treasury with the banking system, as well as increasing the pace of digitalization and the speed of settlements through a system of treasury payments.
   - Broader use of analytical data reflecting the progress of state programs, including those that are part of federal projects, for the purpose of budget execution planning.
   - Unification of legal grounds for appropriation of budgetary funds – i.e., legal acts regulating such appropriation and related agreements (contracts).
   - Creating an environment conducive to better management of accounts receivable.
3. *Introduction of electronic government*, including:
   - Putting in place a regulatory framework for creation and maintenance of government information resources.
   - Defining data management rules for such resources.
   - Harmonizing data of different government information resources.
4. Along with the Unified State Register of Legal Entities, a national citizens' database will be created on the basis of the National Civil Status Register. It is also planned to digitalize the processes of public finance management and ensure the transparency of federal budget planning and execution and budgetary reporting generation.
5. *Development of public service* with a focus on the following areas:
   - Digitalization of staffing functions – creation of a new digital public service.
   - Providing the system of public service with an advanced staffing technology and mechanisms allowing to select personnel based on a standard set of qualification criteria.
   - Putting in place a uniform multiple-level system of career-long professional development for public servants.
   - Improving public servants' remuneration plans, including through increasing guaranteed salaries and performance-based uplifts.
   - Introducing programs intended to motivate public servants and enable their career development, enhancing the practice of onsite training.
   - Developing corruption prevention mechanisms, including monitoring of public servants' incomes and expenses, monitoring of their compliance with existing restrictions, limitations, and responsibilities, and ensuring unavoidability of punishment for corruption-related offences.
   - Improving the system of enforcement proceedings, ensuring more efficient enforcement of court decisions.
   - Developing a unified information and communication space of the system of public service in order to support its effective and efficient operation.
6. *Improving the availability and quality of public services through*:
   - Increasing the number of services provided through multifunctional centers and optimizing the network of such centers.

- Reforming the judicial system and improving the efficiency of judicial bodies, including through providing quality legal assistance to citizens.
- Introducing at the regional and municipal levels a mechanism of evaluation of the quality of public services.

7. *Developing the instruments of state regulation* by means of:
   - Evaluation of the regulatory impact and actual effectiveness of regulations, including the evaluation of their role in the achievement of the goals and objectives of national projects.
   - Instruments of permitting and licensing (systematization of permitting and licensing regimes, maintenance of special registers).
   - Self-regulation mechanisms.
8. *Engagement of citizens at the state and municipal administration levels*, including:
   - Increasing citizens' involvement in the development of proposals and administrative decision-making process.
   - Development of local self-government mechanisms.
   - Introduction of proactive budgeting mechanisms.
   - Enhancing public control practices.

All these activities are intended to help achieve the national development goals of the Russian Federation specified in Decree of the President of the Russian Federation № 474 of 21 July 2020 "On the National Development Goals of the Russian Federation through 2030." These goals include:

(a) Preservation of population, preservation of people's health and well-being
(b) Opportunities for self-fulfillment and development of talents
(c) Comfortable and safe living environment
(d) Decent and efficient work and successful entrepreneurship
(e) Digital transformation

## The System of Executive Authorities of the Russian Federation

As far as the federal executive authorities are concerned, in the period between 1993 and 2000, their types and structure were regulated in a very gentle manner as per Decrees of the President of the Russian Federation "On the Structure of Federal Bodies of Executive Power" № 66 of 10 January 1994, № 1176 and № 1177 of 14 August 1996, and № 867 of 17 May 2000. These Decrees did not define any type of executive body, and a very soft approach was pursued in forming each individual system of executive authorities in terms of both mix and types of specific ministries and agencies. For example, according to the Presidential Decrees of 14 August 1996 (Decree № 1176 "On the System of Federal Bodies of Executive Power" and Decree № 1177 "On the Structure of Federal Bodies of Executive Power"), the system of federal executive authorities comprised the ministries of the Russian Federation (federal ministries) and other federal bodies of executive power. The latter could have the status of a state committee; a committee under a federal service; a Russian agency; a federal oversight body; and inspection department; etc.

An important role in shaping the system of executive power was played by Decree of the President of the Russian Federation № 314 of 2004 "On the System and Structure of Federal Bodies of Executive Power," which introduced a crisp classification providing for three types of executive bodies: (1) federal ministries; (2) federal agencies; and (3) federal services.

Federal ministries develop state policy for and perform legal regulation in their respective areas, coordinate and control their subordinate federal services and federal agencies, and coordinate the use of state off-budget funds.

Federal services exercise control and oversight in their respective areas and also perform special functions in areas such as defense, national security, national border control, prevention of crime, and public safety.

Federal agencies provide public services, manage public property, and enforce the law.

Later, the Government of the Russian Federation approved the provisions on federal bodies of executive power and adopted the resolutions concerning the functioning of the reformed and newly established executive bodies, including the number of deputy heads of these bodies and their organizational structures. However, it was not the end and the process of change still continues.

The composition of the Government of the Russian Federation also has a number of peculiar features. Thus, the initial concept of the administrative reform entrenched in the very first version of Decree № 314 provided that the Chairperson of the Government of the Russian Federation shall only have one deputy (par. 8). This structure of the plural executive body was intended to raise the level of personal responsibility and importance of federal ministers. However, the number of deputies of the Chairperson gradually increased over time from one in 2004 to three in 2005, five in 2007, eight in 2008, and nine in 2020. Each of the deputies of the Chairperson of the government was put in charge of a certain set of government tasks and functioning of respective federal bodies of executive power.

Another peculiarity of the Government of the Russian Federation is the "dual subordination" ministers – i.e., the ministers who report to both the Chairperson as the head of the Government and the one responsible for identifying its focus areas and distributing responsibilities between the members of the Government, and also to the President of the Russian Federation, because, according to Article 32, the President is in charge of the "security wing" of the federal executive branch controlling its bodies both directly and through federal ministers.

Worth mentioning are the powers of the Chairperson of the Government in making staffing decisions. Thus, the Chairperson of the Government of the Russian Federation only has the authority to propose to the President of Russia candidates for Government positions or submit proposals to release Government members from their positions. However, the Chairperson does not have the right to independently remove members of the Government from their offices. It should also be noted that, according to the principle of checks and balances, which fully applies to the collaboration between the executive and the legislative branches, the State Duma does not have the authority to change the composition of the Government once it has been formed, i.e., the State Duma can pass a no-confidence motion against or refuse credence to the Government of the Russian Federation, or summon any Government member for a report, but only the President of the Russian Federation can dissolve the Government or dismiss a member of the Government.

It may be quite interesting to compare the number of federal executive bodies at the stage of establishment of the system of executive power and at the current stage. Thus, pursuant to Decree of the President of the Russian Federation № 1177 of 14 August 1996, "On the Structure of Federal Bodies of Executive Power," there were 24 ministries, 19 state committees, 18 federal services, 3 Russian agencies, and 2 federal inspection departments – in total 67 federal executive organs, including the Government. Currently, according to Decree of the President of the Russian Federation № 21 of 21 January 2020 "On the Structure of Federal Bodies of Executive Power," there are 21 federal ministries, 30 federal services, and 21 federal agencies – i.e., the total of 72 federal executive organs, and recently this number was reduced due to optimization of the system of government amid a difficult financial and economic situation.

No less interesting is the dynamic of the number of federal ministries: while in 1996 and 2020, there were 24 and 21 ministries respectively, the first version of the above mentioned Decree № 314 of 2004 provided for only 14 ministries (5 in the "security wing" and 9 in the "socioeconomic wing" of the Government). Therefore, it is in the context of the administrative reform that a serious attempt was made in 2004 to streamline the administrative machinery. However, the subsequent changes in the public administration environment led to further increase in number of both federal ministries, and federal bodies of executive power in general.

One of the objectives of transformation of the system of federal executive authorities was clearer division of the functions related to the formulation of state policy and legal regulation, provision of public services, and state control and oversight between the federal ministries, agencies, and services, respectively. However, with the issue of Decree of the President of the Russian Federation № 1274 of 24 September 2007 "Questions of the Structure of the Federal Bodies of Executive Power," this three-level system was given up: par. 4 provided for establishment of state committees – a type of federal executive body that could perform all the abovementioned functions thus infringing the logic underpinning the transformation of the system of federal bodies of executive power. It is based on this approach that "Rosrybolovstvo" (State Committee for Fishery) and "Rosmolodezh" (State Committee for Youth Affairs) were established in 2007, although in a short while both were transformed into federal agency pursuant to Decree of the President of the Russian Federation № 724 of 12 May 2008 "Questions of the System and Structure of Federal bodies of Executive Power."

The number of federal ministries significantly increased with the advent of those in charge of specific territories: the Ministry of Northern Caucasus Affairs, the Ministry for the Development of the Russian Far East, and the Ministry of Crimea Affairs – this was yet another trend in the development of the structure of executive authorities. The said ministries were established in order to concentrate government resources allocated for the development of individual groups of Russian regions. However, it is likely that they had been conceived as a temporary phenomenon and were destined for dismissal on achievement by their respective territories of a certain level of social and economic development. Of all the "territorial" ministries, only the Ministry for the Development of the Russian Far East has survived. The other two ministries were disbanded and their functions were transferred to the Ministry of Economic Development.

Analyzing the trends of development and the specificities of the system and structure of federal bodies of executive power, one can come to the conclusion that they are characterized by a relatively high pace of change and transformation that are taking place in the environment of continuity of government and high level of political stability.

It is deemed necessary to take measures to sophisticate and particularize the functions of executive authorities, to open the door for targeted and consistent formation within the system of major "managerial units" or modular divisions of federal ministries and agencies to make them capable of addressing in a comprehensive manner the tasks set by the state. This reformation of the ministries is intended to implement the principles of "collective representation," which call for political responsibility of the ministers for the areas in which they exercise their executive powers, as well as minimization of interdepartmental approvals.

The amendments to the Constitution of the Russian Federation that entered into effect on 4 July 2020 envisage significant revision of the approaches to the arrangement of the system of executive power and the formation of the Government of the Russian Federation. Thus, they give the Russian President the right to have general oversight of the Government, approve the structure of federal bodies of executive power proposed by the Chairperson of the Government, and introduce changes to this structure; in the structure of federal bodies of executive power, identify the bodies subordinate directly to the President of the Russian Federation and the bodies to be managed by the Government of the Russian Federation. Should the President dismiss the Chairperson of the Government, the new Chairperson of the Government shall not submit to the President proposals in regard to the structure of federal bodies of executive power. In fact, these amendments to the Constitution entrench the previously established practice of interaction between the President and the Government.

The amendments significantly changed the mechanism of formation of the Government of the Russian Federation: from now on, the members of the "security wing" of the Government will be appointed upon consultations with the Council of Federation, while the deputies of the Chairperson and the members of the

"socioeconomic wing" will be appointed upon approval by the State Duma. The amended Constitution also features a legal mechanism preventing from dragging out the formation of the Government (it sets the timeframe for the State Duma to confirm the ministers designate, the allowed number of rejections, and the consequences of non-confirmation of a significant number of designates).

## International Experience and National Context

Analyzing the international experience of conducting administrative reforms from the perspective of their understanding and implementation one can see that their main focus is on the depth of transformation and on the desire to align the reform of public administration with the theories of state and public service, because the very vision of the required depth of transformation of public administration depends on the theory that is taken as a basis. Thus, the study of the large-scale reforms of public administration the majority of developed states engaged in shows that they featured approaches such as New Public Management (NPM), Good Governance, Post-NPM, New Governance, etc. For example, almost all developed states reformed their public administration systems with the use of the NPM concept and achieved great results wish could vary depending on the starting conditions. (Pollitt 2014)

At the same time, in considering international experience from the perspective of its use in Russia one should take into account the national context which developed in the process of evolution of Russia's public administration system. Otherwise, the chosen methodology may just prove inapplicable to the Russian reality. It is also necessary to take the context into account in order to understand how applicable the international approaches may be to specific aspects of Russian practice.

In this sense, particularly important is the principle of alignment of Russian and international approaches to administrative reform. This principle is about taking into account a number of factors, the first one being the undisputed fact that Russia is one of the world's oldest states with an established government system. Therefore, any transformations should be evolutionary and take into account both national and international experience.

The second factor is as follows: Too long and too often has the special path of Russia been underscored, however, one of the key features of the modern era is globalization. Russia can only overcome the difficulties and dangers of globalization by improving the quality of governance and by making it efficient. The social thought, not only in Russia, but in many other countries too, has been seeking to embrace the impact of globalization processes on decision making, adapt the principles of sovereignty to a new reality, articulate the approaches that in our country translated into the concept of sovereign democracy.

The third factor, probably the most important one, is the following: An administrative reform requires significant changes in the style of government and in the mindset of state and municipal officials. For all the specificities and peculiarities of different countries' reforms, the experience of public administration transformation in Europe and America, and particularly in Eastern Europe after the collapse of the Communist Bloc, positive outcomes are only possible if a number of mandatory conditions are met such as the following:

- Political and legal documents must clearly specify the goals, the tasks, the mechanisms, and the new managerial techniques.
- Transformation of the system of administration and introduction of a new administrative technology require significant financial investments.
- Great political persistence is necessary to carry out transformation and promote the values of the reform.
- Institutional and structural transformation is not very effective if it is not underpinned by new managerial decision-making techniques and new technologies of budgeting and result-based management.
- Special attention should be paid to the human capacity – skills level and values of personnel.

Historically, the administrative model of Russia evolved according to Max Weber's concept of "rational bureaucracy." In the course of its administrative reform, Russia is migrating from rational bureaucracy to the best practices of New Public Management and New Governance. The country draws on the OECD states' experience of switching from a hierarchical structure to a project-based approach with its clearly defined goals and timelines. At this stage, the system of public administration adopts the practice of business management, some traditional public functions are outsources, and the economy is deregulated and freed from the red tape.

The New Governance model envisages large-scale engagement of non-government entities, businesses, civil society institutions, and non-for-profit organizations in the decision-making process. Crowdsourcing, public–private partnership, public scrutiny, and other forms of participatory democracy are becoming mainstream in Russia.

Taking advantage of different models, Russia intends to address the new challenges it is facing. To achieve its goals, the country relies on a multimodal approach to its public administration reform. This approach rules out direct copying of any international or regional experience. What Russia needs is consistent and pragmatic inventory and reengineering of the existing mechanisms and **regulatory and institutional foundations of public administration in combination with large-scale use of pilot projects and** replication of best-practices in the system of executive power, as well as public and private enterprises.

## Prospects and Risks of Russia's Administrative Reform

The imperative necessity to improve the system of public administration and increase the quality, consistency, and efficiency of governance is understood by all, including those working in the system of government, experts, and representatives of civil society institution, as well as those who, according to the service-based concept of public office work, are the recipients of public services – i.e., the citizens of the Russian Federation. In the course of thorough transformation of its government institutions, Russia has amassed a significant experience. Nevertheless, a lot can be borrowed from other nations implementing their own programs of improvement of governance and development of administrative procedures (Bartsits 2010). All this can serve as basis for further reforms.

Russia's administrative reform already shows a number of successes, including:

- Reorganized system of executive power – in the first place, at the federal level.
- Improved quality of managerial relations between the federal center and the constituent entities of the Russian Federation.
- Reformed system of control and oversight.
- Development of the system of state government at the subnational level and local self-government.
- Introduction by the bodies of state power of new IT and analytical solutions.

The issues of the Russian system of public and municipal administration that still remain to be addressed include (Bartsits 2019):

- The existing federal authorities of the Russian Federation, the state bodies of the constituent entities of the Russian Federation and the bodies of local self-government have not yet formed an efficient system of public authority institutions.
- Russian federalism is still not perfect. After the dismantling of the Soviet administrative command system and Soviet model of federalism, Russia faced the difficult task of gluing together very different subnational entities.
- Some elements of the old administrative command system or their remnants are still in place. While the state underpinned by the administrative command model ceased to exist, the model itself, albeit modified, continues to impede economic development.
- The systems of state and municipal government are not transparent enough. Even though

instruments such as "Open Government" have been put in place, the public consultations on drafts of federal constitutional laws and federal laws as well as the public supervisory boards of state bodies and the system of executive power of the Russian Federation are not sufficiently open to the citizens and business community.
- There is no efficient and effective collaboration between public authorities and civil society.

To win the support of civil society, it is critical to prove that the reform is carried out for the sake of the nation, society, business, and citizens of the Russian Federation rather that the machinery of the state. The philosophy of the reform is centered on improving the life of Russians through building a strong state. The main focus area of the reform is the attainment of the constitutional goals of the Russian Federation, the establishment of the values of a social democratic state.

The modern models of public governance imply making a new social contract between the state authorities and civil society based on enhanced rights and opportunities for citizens along with their deeper engagement in the decision-making process.

All this requires a creative and innovative approach to administrative transformation, as well as transition to the next stage of evolution of the system of public and municipal administration. Significant efforts are needed to retrain the existing personnel and introduce nonfinancial incentives for public–private partnerships engaged in the provision of services.

At present time, Russia is implementing a number of reform programs that are aimed at the functions of the state (first of all, in such aspects as simplification of administrative procedures, optimization of control and oversight functions, and digitalization of public services) and its attitude toward resources (reform of ownership relations, reform of budgetary federalism, etc.). All such programs should not only share the same concept, but also serve as a functional and resource foundation underlying "common" reforms in the area of state building.

The "lengthiness" of the administrative reform makes it necessary to demonstrate from time to time that certain intermediate milestones have been passed and that certain sub-reforms have been completed. To make civil society institutions and citizens support the reform, it is important that the reformists make it innovative and indicate very clearly what results they expect from the transformation of the state machinery.

The national policy of the Russian Federation also gives high priority to limiting the role of the state in the economy, fostering fair competitions, and attracting human capital investments. Pursuing ambitious economic goals the country needs reforms that will help increase internal migration, attract investments, grow the total factor productivity (TFP), etc.

Key risks for the sustainable social and economic development of Russia and threats that may prevent the country from attaining its goals in the said period are as follows:

(a) Reduction of the global demand for commodities, which account for the biggest share of Russia's export. In spite of the global economic crisis of 2008–2009, the average annual growth rate of the global economy in the first decade of the twenty-first century reached 39%, mainly due to the advanced growth of the emerging economies (on average 6.2%) in combination with the steady growth of developed economies (on average 1.8%). In the recent years, we have seen the trend of slowing-down of the growth rate in emerging economies, which can be partly explained by their increased overall economic development level. This trend will continue in the future.
(b) Aggravation of the geopolitical situation has entailed increasing economic and political uncertainty. Most of the Russian companies lost access to foreign borrowings. Their access to advanced foreign technology is limited. As a result, the growth of productivity slowed down, and the economy of Russia needs new approaches to investment attraction.
(c) Reduction of working-age population amid overall stabilization of the demographic situation. For the Russian economy to grow

sustainably, it is critical to increase the flexibility of the labor market, reduce the employment in the public sector and government invested companies, attract foreign labor, and increase the working years of senior citizens.

Taken together, these challenges do not only call for qualitative social and economic transformation, but require a state and municipal government reform as well. Vladimir Mau, Rector of the Russian Presidential Academy of National Economy and Public Administration (RANEPA) says, "... When the country is undergoing two crises at a time (a crisis caused by external shocks and a structural economic crisis), it is the right time to demonstrate the art of public administration..." (Mau 2017) This idea is a quintessential description of the position of both experts in public administration and citizens of Russia.

## Conclusion

Russian society clearly understands that the existing administrative system by no means always ensures effective and efficient governance, proves capable of providing public services to society and individual citizens, or fully complies with the laws and rules adopted in accordance with democratic procedures. Apparently, in many areas (structural transformation, legal regulation of state and municipal government, digitalization), the reforms have yielded significant changes in the field of public administration and improved the living standards.

Analysis of the most visible challenges of the administrative reform has revealed the causes of ineffectiveness of some approaches and helped identify more effective ones. The previous experience of dealing with specific focus areas of the administrative reform, both positive and negative, allowed to set new priorities in transforming Russia's system of government. It has become clear, to both the ideologists of the reform and those who are responsible for their implementation, that the administrative reform should be regarded not as desirable but as absolutely essential for aligning the system of state and municipal government with the principles of national development enshrined in the Russian Constitution.

Everyone in Russia agrees that the administrative reform must go on. Coming up with a validated concept of evolution of Russia's public administration system will facilitate efficient and sustainable development of the Russian state and ensure its stability. To occupy its rightful place in the community of powerful nations, Russia must share with the world its vision of the model of governance.

## Synonyms

Economic policy; Public administration; Regulatory policy

## Definition

**Government regulation of the economy** is a system of standard measures of legislative, executive, and supervisory nature implemented by legitimate state institutions and nonprofit organizations in order to stabilize and adapt the existing socioeconomic system to changing conditions as well as to guide the system to certain goals (Kushlin 2016).

## Introduction

In recent years, the role of the state in the economy has been steadily increasing. A series of economic crises, the growing uncertainty of further development, and the increased complexity of economic systems led to the government regulation of the economy being considered as one of the most important factors of modern economic development.

It should be noted that the government regulation of the economy is closely related to the notions of "economic policy" and "regulatory policy," but, in contrast, it covers a wider range of issues and is focused not only on the medium and long-term perspectives but also on the response to operational tasks of public administration.

In each country, government regulation of the economy has its own particularities, determined by the state and the structure of the national economy, current external and internal challenges, priority development goals, characteristics of the public administration system, and sociocultural specificity. The more complex and the longer the history of a country is, the more diverse the forms, instruments, and methods of the government regulation of the economy tend to be.

## History and Theory of Government Regulation of the Economy in Russia

The role of the state in organizing and regulating economic processes is traditionally high in Russia. The diversity of economic forms and structures in the economy requires the state to strengthen coordinating functions and regulate constantly emerging imbalances (sectoral, regional, technical and technological, etc.).

The economic development of vast areas of the country requires the construction of large-scale economic infrastructure, which can be organized and provided only by the state.

Recurrent attempts to reduce the economic gap between Russia and the leading world powers have brought about the process of continuous economic reforms in Russia, initiated by the state and carried out by mobilizing resources.

Moreover, there is a sociocultural basis in Russia for recognizing the dominant role of the state in all spheres of society: the priority of social justice over economic efficiency, common goals over private ones, and paternalistic attitudes of the population.

As a result, the state has become a guiding force of economic development in Russia, a "reasonable leader" that determines the strategy of economic development and mobilizes, stimulates, coordinates, and directs actions of other economic actors.

This special role of the state in economic development, which reached its maximum during the USSR period, gave rise to deep theoretical studies of the nature, tasks, mechanisms, and technologies of state regulation of the economy in Russian economic thought. Three main issues were particularly important.

The first problem concerned the relationship between government regulation of the economy and market mechanisms of self-regulation. In the 1920s, the issues of planned management of the economy and the role of market self-regulation mechanisms were actively discussed in Russia. At that time, within the framework of building a socialist economy, the priority was given to centralized state administration as a deliberate way of directing economic processes, corresponding to the social nature of production. From the late 1980s to the early 1990s, the same issue was resolved in favor of the full-scale development of market self-regulation mechanisms, which corresponded to the goal of building a market economy in Russia. Since the 2000s, the

regulatory functions of the state and the market have no longer been opposed to each other but considered as complementary mechanisms, where the limits of applicability depended on their comparative efficiency.

The second theoretical problem of state regulation of the economy was associated with the ability of the state to analyze economic information for the purpose of regulatory impact. One of the conditions for effective management is the correspondence of the complexity of the supervising system to that of the supervised system. In order to process huge amounts of information from economic entities, there was a need for a large-scale management system, which obviously increased administrative costs and impaired the effectiveness of the centralized public administration. For the planned economy in the USSR, this issue became one of the key challenges.

Since the mid-1960s, the theory of optimal functioning of the economy began to actively develop in the USSR. It served as a theoretical substantiation of the system of optimal economy functioning and used economic and mathematical methods to develop new approaches to the modeling and regulation of the national economy. In 1975, Leonid Vitaliyevich Kantorovich, one of the creators of this theory, became the Nobel Prize laureate in economics "for his contribution to the theory of optimum allocation of resources."
